# Selected Abstracts

## Editor's Note

These abstracts are prepared by the author of each article. Each journal editor, where we have an abstracting agreement, is responsible for instructing the author according to our style sheet. These editors are responsible, additionally, for sending these abstracts to the *Journal of Economic Literature*. Only a minimal amount of copy editing is done on these abstracts; thus the reader should turn to the author of the abstract and not this journal if an error of fact or phrasing arises.

NOTE: The limit of 100 words for abstracts is being strictly enforced; i.e., longer abstracts are not printed.

### 010 GENERAL ECONOMICS

#### 011 General Economics

**Atkinson, Glen W.**—Instrumentalism and Economic Policy: The Quest for Reasonable Value

Institutional economists argue that evolutionary instrumentalism offers a superior scientific foundation for economic policy making than the prevailing equilibrium models. Because social evolution is guided by artificial rather than natural selection, values must be incorporated into economic inquiry. Instrumentalists consider policy actions in terms of consequences rather than from antecedent natural states. Conflicts must be resolved without reference to a natural order. John Commons developed his theory of reasonable value from these concepts. He concluded that the process of the common law coupled with economic theory provides a means to separate unreasonable privilege from reasonable good-will created by public policy. *J. Econ. Issues*, Mar. 1987, 21(1), pp. 189-202. University of Nevada, Reno.

**Benton, Raymond, Jr.**—Economics and the Loss of Meaning

Economics can be looked at and interpreted from any number of perspectives. The present article suggests that economics can be studied beneficially as a belief system—as a mode of persuasion and as a system for the creation and inculcation of meaning. A model of religious

belief systems is borrowed from anthropology, explained, and applied to economics. How economics creates and inculcates meaning is illuminated as well as the basis for its persuasion. The crises that economics as a belief system is faced with are discussed, as well as both traditional and new sources for its lack of persuasion among many. The educational role of the social economist is discussed. *Rev. Soc. Econ.*, Dec. 1986, 44(3), pp. 251-67. Loyola University, Chicago.

**Dahlgran, Roger A.**—Agricultural Economists in the Information Age: Awareness, Usage and Attitudes toward Electronic Bibliographic Databases

The construction, content, and potential use of electronic bibliographic databases is discussed. A survey of AAEA members indicates that both usage and unawareness of these databases are significant; that research and government agricultural economists are disproportionately users of electronic bibliographic databases while extension and agribusiness agricultural economists are disproportionately nonusers; that such databases average 28.9 percent useful citations for agricultural economic searches, though this percentage can be raised with help from a professional librarian; and that AAEA members favor having their literature citations in electronic form. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 166-73. University of Arizona.

### 020 GENERAL ECONOMIC THEORY

**Stegman, Trevor R.**—On the Rationality of the Rational Expectations Hypothesis

This note argues that the claim that the rational expectations hypothesis is a method of endogenizing the process of expectations formation, which is based on the principles of optimization, is not justified. The essential model-independent property of the rational expectations hypothesis is that forecasts are unbiased. It is shown that, since costs of error are likely to be correlated with error magnitude, unbiasedness is not a necessary property of a rational forecast and bias will be positively desirable when error costs are asymmetric or there are restrictions on the possible values of the variable to be forecast. *Australian Econ. Pap.*, Dec. 1985, 24(45), pp. 350-55. University of New South Wales.

**Whalen, Charles J.—A Reason to Look beyond Neoclassical Economics: Some Major Shortcomings of Orthodox Theory**

Unlike those employing neoclassical theory, dissenting economists are often asked to defend the methodological and theoretical foundation of their analyses. In providing one portion of such a defense, this article identifies a number of methodological, analytical, and practical shortcomings of conventional economics. While the essay does not claim to offer a complete list of such shortcomings, the weaknesses identified are believed to form a solid critique of—and thus a reason to look beyond—orthodox theory. The author concludes by suggesting that a broader, problem-oriented view of economic science is required to address today's most pressing economic challenges. *J. Econ. Issues*, Mar. 1987, 21(1), pp. 259-80. University of Texas, Austin.

**021 General Equilibrium and Disequilibrium Theory**

**Epstein, Larry G.—The Global Stability of Efficient Intertemporal Allocations**

This paper describes a continuous time model of an economy with finitely many infinitely-lived consumers and a finite number of capital goods. Two objectives are achieved. First, recursive (nonadditive) utility functionals are formulated and analyzed. Second, these preference functionals are applied to analyze the nature of efficient allocations in a dynamic econ-

omy. Two classes of global turnpike propositions are proven which provide the basis for a model of the long-run distribution of wealth. These propositions also provide new perspective regarding existing stability literature based on additive utilities. *Econometrica*, Mar. 1987, 55(2), pp. 329-55. University of Toronto.

**Epstein, Larry G.—A Simple Dynamic General Equilibrium Model**

This paper analyzes a single sector economy with  $H > 1$  infinitely-lived agents that operate in a continuous time framework. Utility functions are recursive but not additive. Both efficient and perfect foresight competitive equilibrium allocations are considered. The existence and stability of such allocations are investigated locally, i.e., in a neighborhood of steady state allocations. The model is shown to be useful for explaining the distribution of wealth and consumption across agents, and for analyzing the way in which wealth redistribution can affect the dynamics of aggregate economic variables. *J. Econ. Theory*, Feb. 1987, 41(1), pp. 68-95. University of Toronto.

**Huang, Chi-fu—An Intertemporal General Equilibrium Asset Pricing Model: The Case of Diffusion Information**

This paper provides sufficient conditions for the equilibrium price system and a vector of exogenously specified state variable processes to form a diffusion process in a pure exchange economy. The conditions involve smoothness of agents' utility functions and certain nice properties of the aggregate endowment process and the dividend processes of traded assets. In place of the dynamic programming, a martingale representation technique is utilized to characterize equilibrium portfolio policies. This technique is useful even when there does not exist a finite dimensional Markov structure in the economy and thus the Markovian stochastic dynamic programming is not applicable. Agents are shown to hold certain hedging mutual funds and the riskless asset. In contrast to earlier results, the market portfolio does not have a special role in hedging, since the markets are dynamically complete. When there exists a finite dimensional Markov system in the economy, the dimension of the hedging demand identified

through the Markovian dynamic programming may be much larger than that identified by the martingale method. *Econometrica*, Jan. 1987, 55(1), pp. 117-42. Massachusetts Institute of Technology.

**Jones, Larry E.**—The Efficiency of Monopolistically Competitive Equilibria in Large Economies: Commodity Differentiation with Gross Substitutes

A general model of commodity differentiation is developed using two different approaches to the theory of demand. It is shown that a local version of Bertrand's argument holds under reasonable conditions. If all commodities are substitutes and sunk costs are small, there is never too little commodity differentiation relative to the optimum. Under the same conditions, monopolistically competitive equilibria are approximately perfectly competitive if the optimal collection of commodities is sufficiently rich. *J. Econ. Theory*, Apr. 1987, 41(2), pp. 356-91. Northwestern University.

**Mehta, Ghanshyam and Tarafdar, Enayet**—Infinite-Dimensional Gale-Nikaido-Debreu Theorem and a Fixed-Point Theorem of Tarafdar

This paper proves the equivalence of five fixed point theorems in topological vector spaces and then uses them to deduce an infinite-dimensional generalization of the classic Gale-Nikaido-Debreu theorem. The proof is based on the Hahn-Banach theorem and the Tarafdar fixed point theorem. There is also a discussion of the relationship of this generalization to the existence theorems of C. Aliprantis and D. Brown, K. Border, N. Yannelis, and others. *J. Econ. Theory*, Apr. 1987, 41(2), pp. 333-39. University of Queensland, Australia.

**Ray, Debraj**—Nonpaternalistic Intergenerational Altruism

The paper develops a concept of equilibrium behavior and establishes its existence in a model of nonpaternalistic intergenerational altruism. Each generation derives utility from its own consumption and the utilities of its successors. Equilibrium capital stocks are time-monotone and therefore converge to a steady state. Finally, when each generation's utility depends

on that of at least two successors, equilibria may be inefficient. This is shown by an example where feasible programs exist providing greater consumption (compared to the equilibrium path) for every generation. *J. Econ. Theory*, Feb. 1987, 41(1), pp. 112-32. Stanford University and Indian Statistical Institute, New Delhi.

**Yannelis, Nicholas C.**—Equilibria in Noncooperative Models of Competition

An equilibrium in a game theoretic setting à la G. Debreu (1954) and W. Shafer and H. Sonnenschein (1975) with a broader structure is proved. In particular, the framework is general enough to encompass both the Aumann (1966) economy of perfect competition and the nonordered preferences setting of A. Mas-Colell (1974). Moreover, since the dimensionality of the strategy space may be infinite it contains Bewley-type (1972) results and may be useful in obtaining existence results for economies with a measure space of agents and infinitely many commodities. *J. Econ. Theory*, Feb. 1987, 41(1), pp. 96-111. University of Minnesota and Tulane University.

## 022 Microeconomic Theory

**Basu, Kaushik**—One Kind of Power

In standard models in economics, individuals interact pairwise. Allowing for "triadic" relations explains concepts like power and influence, which have been considered in economics only peripherally. This paper constructs three illustrations of power, all relying on triadic relations. The first demonstrates how unwanted regimes could persist because of interpersonal conjectures. The second shows how a laborer in backward agriculture may agree to an exchange with a landlord, from which he gets negative utility. The third formalizes our notion of "an influential man," and tries to explain his existence. *Oxford Econ. Pap.*, July 1986, 38(2), pp. 259-82. Delhi School of Economics.

**Baumol, William J. and Willig, Robert D.**—Contestability: Developments since the Book

In the four years since publication of the contestable markets book, a remarkable amount has been published on this subject. Regulatory agencies and antitrust decisions have also adopted policies explicitly derived from contest-

ability analysis. In some special situations contestability analysis has served appropriately to justify deregulation or immunity from antitrust, elsewhere it has yielded tools for regulation of market power. The article summarizes these developments, describing pertinent writings by economists, and regulatory and judicial decisions. *Oxford Econ. Pap.*, Supp. Nov. 1986, 38, pp. 9-36. Princeton University and New York University; Princeton University.

**Benoit, Jean-Pierre and Krishna, Vijay**—Dynamic Duopoly: Prices and Quantities

The authors study a dynamic model of duopoly in which firms choose both prices and quantities. If quantity (capacity) choices are relatively inflexible, firms generally carry excess (idle) capacity in equilibrium. Because of this enforcement cost, firms are unable to achieve monopoly levels. This contrasts with models in which firms compete in either prices or quantities alone. On the other hand, if capacities are flexible, firms may be able to sustain monopoly behavior. *Rev. Econ. Stud.*, Jan. 1987, 54(1), pp. 23-35. Columbia University; Harvard University.

**Berg, Morten**—Giffen's Paradox Revisited

The main argument of this paper is that the theoretical definition of Giffen's paradox is ambiguous to the extent that it ignores the initial endowments of the consumer. A Slutsky equation incorporating positive initial endowments is used to discuss the Irish demand for potatoes in 1845-1849, and a set of conditions to test whether or not the Irish potato was a Giffen good are deduced. *Bull. Econ. Res.*, Jan. 1987, 39(1), pp. 79-89. Norwegian School of Economics and Business Administration, Bergen-Sandviken.

**Bernheim, B. Douglas; Shleifer, Andrei and Summers, Lawrence H.**—The Strategic Bequest Motive

Although recent research suggests that intergenerational transfers play an important role in aggregate capital accumulation, our understanding of bequest motives remains incomplete. The authors develop a simple model of strategic bequests in which a testator influences the decisions of his beneficiaries by holding

wealth in bequeathable forms and by conditioning the division of bequests on the beneficiaries' actions. The model generates falsifiable empirical predictions that are inconsistent with other theories of intergenerational transfers. The authors present econometric and other evidence that strongly suggests that bequests are often used as compensation for services rendered by beneficiaries. *J. Lab. Econ.*, Pt. 2, July 1986, 4(3), pp. S151-82. Stanford University; Massachusetts Institute of Technology; Harvard University.

**Bidard, Christian**—Is von Neumann Square?

Generically, the active part of a von Neumann system (efficient methods and commodities) is square and has a positive inverse: it defines a well-behaved Sraffa system for joint production. Hence, for high profit rates of a Sraffa system, prices are positive and vary in the right direction, and one has a nonsubstitution result, as for single-product techniques. *J. Econ. (Z. Nationalök.)* 1986, 46(4), pp. 407-19. Université de Paris X-Nanterre.

**Bonanno, Giacomo**—Location Choice, Product Proliferation and Entry Deterrence

Within a slightly modified version of Hotelling's model (1929) the author reconsiders the claim that the threat of entry induces existing firms to produce a larger number of products than otherwise. The author shows that entry deterrence, although optimal, need not be achieved through product proliferation. In some cases the incumbent monopolist resorts to an entry-detering strategy based on location choice rather than product proliferation. The author also shows that in some cases the number of products chosen by the incumbent facing the threat of entry is strictly greater than the minimum number required to deter entry. *Rev. Econ. Stud.*, Jan. 1987, 54(1), pp. 37-45. Nuffield College, Oxford.

**Caplin, Andrew S. and Nalebuff, Barry J.**—Multi-dimensional Product Differentiation and Price Competition

The authors present a framework for analyzing the design and pricing of differentiated products. Their approach has two novel features. Individuals have Cobb-Douglas prefer-

ences over multidimensional product characteristics. The distribution of Cobb-Douglas parameters across society is concave: this implies that there is general agreement about which characteristic mix is most desirable. With these assumptions the authors demonstrate existence of a pure strategy price equilibrium for arbitrary pairs of products in two dimensions and also show how raising the dimensionality of the product space provides an advantage to a late entrant in a price-regulated duopoly. *Oxford Econ. Pap.*, Supp. Nov. 1986, 38, pp. 129-45. Princeton University.

**Chavas, Jean-Paul—Constrained Choices under Risk**

This paper explores the implications of quantity rationing in the context of production theory under price uncertainty and risk aversion. The influence of rationing on the properties of risk responsive supply-demand functions is analyzed in detail. A number of results concerning the impact of risk or technology on economic behavior under quantity constraints are derived. *Southern Econ. J.*, Jan. 1987, 53(3), pp. 662-76. University of Wisconsin.

**Dixon, Huw—Strategic Investment with Consistent Conjectures**

This paper combines two ideas in oligopoly theory: models of strategic investment and T. Bresnahan's (1981) concept of consistency of conjectures. Firms precommit capital stocks and hence determine their short-run cost function. The degree of competition in the product market is made endogenous by imposing Bresnahan's consistency condition. Firms take into account the influence of their investment decision on the degree of competition in the product market. The equilibrium conjecture of firms will lie between the Cournot and Bertrand values. In general there will be factor bias and inefficiency in production, which in a symmetric equilibrium is one of undercapitalisation. The degree of competition is sensitive to the wage-rental ratio: for high wage-rental ratios the equilibrium conjecture will be nearly Bertrand, and for low ratios they will be Cournot. *Oxford Econ. Pap.*, Supp. Nov. 1986, 38, pp. 111-28. Birkbeck College, London.

**Dixon, Huw—Approximate Bertrand Equilibria in a Replicated Industry**

The paper considers the existence and properties of approximate Bertrand equilibria in a replicated industry. Price setting firms produce a homogeneous product with weakly convex costs. The main results are that an  $\epsilon$ -equilibrium exists if the industry is large enough; and that if the  $\epsilon$  is small enough, and the industry large enough, any  $\epsilon$ -equilibrium is approximately competitive. These results depend on how contingent demand is specified. *Rev. Econ. Stud.*, Jan. 1987, 54(1), pp. 47-62. Birkbeck College, London.

**Hansson, Ingemar—Market Adjustment and Investment Determination under Rational Expectations**

This paper extends traditional comparative statics analysis by providing a theory for the adjustment between stationary states for a competitive industry that faces upward sloping supply curves for durable and nondurable inputs given rational expectations. It is shown that capital adjustment is especially slow for an industry with long-lived capital, an inelastic supply of investment goods, and a low elasticity of substitution between durable and nondurable inputs. A numerical analysis reveals that it takes 6.4 to 50.5 years to close half of the gap between actual and stationary state capital for depreciation rates of 0.01 to 0.05. *Economica*, Nov. 1986, 53(212), pp. 505-14. University of Lund.

**Harrington, Joseph E., Jr.—Collusion in Multiproduct Oligopoly Games under a Finite Horizon**

Applying recent results on finitely repeated games to oligopoly theory, the author finds that there exists a class of finite horizon output games in which collusion can be achieved as a subgame perfect equilibrium. Trigger strategies prevent defection from the cooperative outcome by credibly threatening that the defector will be forced to exit the industry. For the case of a multiproduct oligopoly, it is shown that collusion in one market can be enforced by the threat of punishment in a second market if someone defects. Even though the two markets are structurally independent, the firms make them strategically interdependent through

their strategies. *Int. Econ. Rev.*, Feb. 1987, 28(1), pp. 1-14. Johns Hopkins University.

**Hayes, Beth—Competition and Two-Part Tariffs**

Traditional theories have viewed two-part tariffs as price-discrimination devices, employed exclusively by firms with market power. This paper offers an explanation for the use of such price schedules by firms in highly competitive markets, such as health clubs. It is argued that, in a world with buyer uncertainty about future demands, they can provide insurance for the risk-averse buyers. The fixed entry fee finances a marginal price below marginal cost. It is shown that the benefits from this lower price will, under certain specified conditions, outweigh the costs of the entry fee. *J. Bus.*, Jan. 1987, 60(1), pp. 41-54. Northwestern University.

**Henderson, John S. and Henderson, Richard H.—Perversity in Factor Demand Curves—Simulation and Theory**

This article analyzes factor demand by simulation methods for a monopoly firm with a straight-line demand curve and a CES production function. Under these conditions, the long-run factor demand for labor will intersect a short-run curve three times. The greater relative flatness of the long-run curve predicted by the Le Chatelier Theorem for small price changes is validated. However, for larger price changes the short-run curve is flatter. For still larger price changes, the long-run curve is again flatter. This work builds on that of David de Meza (1981, 1982). *Economica*, Nov. 1986, 53(212), pp. 515-18. Georgia State University; Georgia Institute of Technology.

**Jovanovic, Boyan and Rob, Rafael—Demand-Driven Innovation and Spatial Competition over Time**

This paper explores a model of innovation and spatial competition over time. A key implication of the paper is that firms' size is positively autocorrelated across time. The mechanism that generates this persistence works only in heterogeneous product markets and is based on the idea that larger firms possess better information about the design of future products. Some cor-

roborating evidence is cited. *Rev. Econ. Stud.*, Jan. 1987, 54(1), pp. 63-72. New York University; University of Pennsylvania.

**Kagel, John H. and Levin, Dan—The Winner's Curse and Public Information in Common Value Auctions**

In common value auction experiments, individual judgment errors significantly alter market outcomes relative to standard economic formulations. Experienced bidders show sensitivity to the strategic considerations underlying the auction but not to item valuation considerations. Nash equilibrium models accurately characterize auctions with small numbers of bidders (3-4). However, auctions with large numbers (6-7) produce more aggressive bidding, resulting in negative profits, the winner's curse. Public information reducing value uncertainty raises seller's revenues in the absence of a winner's curse, but reduces revenue in its presence. Similarities between laboratory and field data from outer continental shelf lease sales are discussed. *Amer. Econ. Rev.*, Dec. 1986, 76(5), pp. 894-920. University of Houston.

**Katz, Michael L.—The Welfare Effects of Third-Degree Price Discrimination in Intermediate Good Markets**

The author examines third-degree price discrimination by an upstream monopolist in an intermediate good market. Discrimination is motivated by the fact that downstream firms differ in their abilities to integrate backward into supply of the input. The author shows that under reasonable specifications of equilibrium, price discrimination leads to all buyers facing higher input prices. In other cases, discrimination raises some prices and lowers others. The author derives conditions under which discrimination lowers welfare by reducing total output and shows that in some markets discrimination will raise welfare by preventing socially inefficient backward integration. *Amer. Econ. Rev.*, Mar. 1987, 77(1), pp. 154-67. Princeton University.

**Klemperer, Paul D.—Entry Deterrence in Markets with Consumer Switching Costs**

In many markets consumers have transaction or learning "switching costs" between functionally undifferentiated brands. New entry into such markets may be deterred either by large customer bases and/or large switching costs, which deny customers to an entrant, or by small customer bases and/or small switching costs, which mean an incumbent will respond aggressively to an entrant. An incumbent threatened by entry may therefore price either lower or higher than otherwise. A firm with the right to enter early may make less profits over time than an otherwise identical firm that is unable to enter the market until later. *Econ. J.*, Supp. 1987, 97, pp. 99-117. St. Catherine's College and Institute of Economics and Statistics, Oxford University.

**Löfgren, Karl-Gustaf and Ranneby, Bo**—Behavioral Modes for a Firm Facing an Uncertain Supply or Demand Curve

This paper contains a theoretical analysis of the behavior of a firm facing a stochastic supply and demand curve. Certain behavioral modes can be ranked under weaker conditions than in corresponding studies on stochastic demand. For other comparisons, the authors derive sufficient conditions for one mode to dominate another. Earlier results indicate that a firm which faces demand uncertainty prefers price variability to quantity variability. It is shown by a counter example that the "price variability preference," which is troublesome for proponents of temporary fixed-price equilibrium models, is a consequence of restrictive stochastic specification. *Scand. J. Econ.*, 1987, 89(1), pp. 39-54. Swedish University of Agricultural Sciences, Umeå.

**Loomes, Graham and Sugden, Robert**—Some Implications of More General Form of Regret Theory

Regret theory entails the possibility of non-transitive pairwise choices. It therefore raises questions about how individuals choose from sets of more than two actions, especially when there exists a subset of pairs of actions over which preferences cycle. A generalization of regret theory is suggested and is compared and contrasted with P. Fishburn's generalization of skew-symmetric bilinear utility theory. It is also shown that under this generalization an

individual with non-transitive pairwise preferences will not be caught in a never-ending cycle and is not vulnerable to being "money-pumped" into bankruptcy. *J. Econ. Theory*, Apr. 1987, 41(2), pp. 270-87. University of York; University of East Anglia.

**MacLeod, W. B.; Norman, G. and Thisse, J.-F.**—Competition, Tacit Collusion and Free Entry

Few oligopoly models address the problem of tacit collusion when there is the possibility of entry. One model that does so is the well-known Löschian model of spatial competition. The purpose of this paper is to present a reexamination of this model within the context of game theory. The authors model the process leading to industry equilibrium with collusive behavior as a two-stage process. The first stage determines a free-entry equilibrium using Bertrand-Nash assumptions, while the second stage deals with the collusive selection of price. This solution is shown to be a subgame perfect Nash equilibrium. At equilibrium, firms make long-run excess profits even in the presence of free entry. *Econ. J.*, Mar. 1987, 97(385), pp. 189-98. Queen's University and CORE; University of Leicester and CORE; Catholic University of Louvain.

**Matthews, Steven and Moore, John**—Monopoly Provision of Quality and Warranties: An Exploration in the Theory of Multidimensional Screening

New ways of handling incentive constraints between nonadjacent types of buyer are used to solve a monopoly screening problem. The monopoly wishes to price discriminate by designing a product line of goods distinguished by different quality, warranty, and price attributes. The multidimensionality of the line causes the local approach usually taken to fail. The optimal product line is nevertheless fully characterized. Contrary to the result always obtained in simple models, attributes need not be monotone in buyer type, e.g., more eager types sometimes receive lower quality. *Econometrica*, Mar. 1987, 55(2), pp. 441-67. Northwestern University and the University of Pennsylvania; London School of Economics and Massachusetts Institute of Technology.

**Perrakis, Stylianos and Warskett, George**—Uncertainty, Economies of Scale, Barrier to Entry

Entry deterrence is examined under demand uncertainty and economies of scale. Both incumbent and potential entrant select capacity before demand is observed, provided expected discounted profit exceeds the cost of capacity (risk neutrality). As in the certainty case, entry deterrence is not profitable in the absence of economies of scale. However, Schmalensee recently proved another certainty result (that the monopoly profit stream which can be shielded from entry by economies of scale is bounded from above by the cost of minimum efficient scale) is not valid in the presence of uncertainty, even under risk neutrality. *Oxford Econ. Pap.*, Supp. Nov. 1986, 38, pp. 58–74. University of Ottawa; Carleton University.

**Raubitschek, Ruth S.**—A Model of Product Proliferation with Multiproduct Firms

This paper presents a model of product proliferation by multiproduct firms. Firm behavior is based on a two-stage process in which there is centralized decision making in new product introductions and decentralized management of existing products. In equilibrium, the number of products each firm has, as well as its total profits, are inversely related to the cost of introducing a new product and to the number of firms in the market. But, as the number of rivals increases, the total number of products in the market increases, although total industry profits decrease. *J. Ind. Econ.*, Mar. 1987, 35(3), pp. 269–79. New York University.

**Raymon, Neil**—Price Ceilings, Product Quality and Consumer Welfare

Sufficient conditions are presented such that imposition of a quality-invariant ceiling on output price leads to an upward shift in hedonic prices, causing every consumer's utility to fall. The conditions include: (1) a linear household technology, (2) (implicit) excess demand functions for qualitative attributes are decreasing in the ceiling, (3) attributes are gross substitutes. Condition (3) can be replaced with other assumptions, admitting attributes being gross complements. A class of examples indicates that if the ceiling is not quality-invariant, consumers

may be worse off or better off, depending on the function relating the price ceiling to quality. *J. Econ. (Z. Nationalök.)* 1986, 46(4), pp. 369–95. University of Missouri.

**Reynolds, Stanley S.**—Capacity Investment, Preemption and Commitment in an Infinite Horizon Model

The commitment value of capacity is analyzed in an infinite horizon duopoly model. The paper focuses on the role of alternative behavioral assumptions about the ability of firms to commit to investment paths. Each firm's investment strategy in a feedback Nash equilibrium is shown to be a decreasing function of its rival's current capacity. This creates an incentive for a firm to expand its capacity to preempt subsequent rival investment. In a precommitment equilibrium there are no incentives to invest preemptively. As a consequence, steady state capacity levels are greater in a feedback Nash equilibrium than in a precommitment equilibrium. *Int. Econ. Rev.*, Feb. 1987, 28(1), pp. 69–88. University of Arizona.

**Roberts, John**—A Signaling Mode of Predatory Pricing

Predatory pricing involves pricing lower in the presence of competition than would otherwise be optimal in order to deter entry, induce exit, or discipline (reduce the future output of) a rival. Signalling of private information about market conditions through price can give rise to predation aimed at the latter two objectives. However, in separating equilibrium, no extra exit or output reduction is induced relative to the full information benchmark. Nevertheless, such predation is not innocuous, because the expectation of its occurrence may reduce entry. *Oxford Econ. Pap.*, Supp. Nov. 1986, 38, pp. 75–93. Stanford University.

**Sandelin, Bo**—Some Unneoclassical Results in Neoclassical Investment Theory

This article builds on the investment models in the classic books by Erich Schneider (1944) and by Friedrich and Vera Lutz (1951). However, the author concentrates on a higher degree of endogeneity by postulating that the investor simultaneously determines the three dimensions: scale (number of machines), dura-

bility, or maturation time, and invested amount. This is decisive, and makes it possible to get untraditional comparative statics results in some cases. *Australian Econ. Pap.*, June 1986, 25(46), pp. 83-93. University of Gothenburg, Sweden.

**Schwartz, Marius—The Nature and Scope of Contestability Theory**

Contestability theory suggests that threat of entry may prevent monopolistic pricing even in a concentrated market because, if exit from the market is easy, monopolistic pricing would induce hit and run entry. This paper shows that, despite easy exit, hit and run entry is unprofitable if incumbents' price responses are sufficiently rapid. Only market data (not experimental) can reveal whether responses are sufficiently rapid; available evidence indicates they are. Another version of contestability theory stresses threat of entry through long-term contracts. This threat, too, is shown to be unlikely to check monopolistic pricing. *Oxford Econ. Pap.*, Supp. Nov. 1986, 38, pp. 37-57. Georgetown University and U.S. Department of Justice, Washington, D.C.

**Simon, Leo K.—Bertrand Price Competition with Differentiated Commodities**

This paper develops a general equilibrium, differentiated commodity version of Bertrand price competition. The author studies two related market games in which buyers as well as sellers announce both quantities and prices. In the first game, buyers' strategies are artificially restricted. The Nash allocations of this game will be nearly competitive, provided that the commodities supplied by sellers are sufficiently similar. In the second game, the restriction on buyers' strategies is relaxed and a stronger solution criterion, called local perfection, is invoked. The locally perfect equilibria of the unrestricted game coincide with the Nash equilibria of the restricted game. *J. Econ. Theory*, Apr. 1987, 41(2), pp. 304-32. University of California, Berkeley.

**Suzumura, Kotaro and Kiyono, Kazuharu—Entry Barriers and Economic Welfare**

The relationship between economic welfare and the number of firms in a quasi-Cournot

market is examined. The authors presuppose the existence of a strong ("first-best") government that can enforce the marginal-cost principle along with regulating the number of firms. It is shown that there exist excessive number of firms at the free-entry quasi-Cournot equilibrium relative to the "first best." The thrust of this result survives even if a utopian "first-best" government is replaced by a "second-best" government that leaves the firms to pursue their respective profit maximization freely and engages solely in regulating the number of firms. *Rev. Econ. Stud.*, Jan. 1987, 54(1), pp. 157-67. University of Pennsylvania and Hitotsubashi University; Gakushuin University.

**Vives, Xavier—Small Income Effects: A Marshallian Theory of Consumer Surplus and Downward Sloping Demand**

The author formalizes the Marshallian idea that when the proportion of income spent on any commodity is small then the income effects are small. If  $n$  is the number of goods, the author shows that the order of magnitude of the norm of the income derivative of demand is  $1/\sqrt{n}$ . As a corollary for the case of a single price change, the percentage error in approximating the Hicksian Deadweight Loss by its Marshallian counterpart goes to zero at least at the rate  $1/\sqrt{n}$  and demand is downward sloping for  $n$  sufficiently large. *Rev. Econ. Stud.*, Jan. 1987, 54(1), pp. 87-103. University of Pennsylvania.

**Weiss, Nitzan and Lee, Phil—Sustainability of the Multiproduct Monopoly and Ramsey-Optimal Pricing**

This article is based on recent developments in the literature dealing with multiproduct cost concepts. Our article offers a set of conditions which are simultaneously necessary and sufficient for the prevention of competitive entry. These conditions include Ramsey-prices as a special case of sustainable prices. However, the above conditions show that, in the absence of regulation, the monopolist has no inducement to elect the Ramsey-optimal price-output vector from the set of sustainable vectors. Thus the pressure of potential entry does not assure that the public interest is served by a sustainable monopolist. *J. Inst. Theoretical Econ.*, Sept. 1986, 142(3), pp. 473-92. Columbia University; Korea University.

**Wolinsky, Asher**—Brand Names and Price Discrimination

This paper explains the fact that firms market both labeled and unlabeled products as a practice of price discrimination that emerges as a non-cooperative equilibrium outcome. The authors consider a market for a differentiated product where the possibility to price discriminate by the selective use of labels is due to the fact that buyers differ in the intensity of their preferences and that, before they buy, they are unable to distinguish among the different brands without the aid of identifying labels. *J. Ind. Econ.*, Mar. 1987, 35(3), pp. 255-68. The Hebrew University, Israel.

### 023 Macroeconomic Theory

**Baldani, Jeffrey P. and Michl, Thomas R.**—A Balanced Budget Multiplier for Interest Payments

This paper develops a two-class macroeconomic model in which the effects of the rising interest burden of the national debt can be studied. The model assumes all saving is done by property owners, the tax rate on property income is a fixed multiple of the tax rate on wage income, and the before-tax distribution of factor income is constant. A balanced budget increase in interest payments—i.e., an increase in interest payments subsequently financed by taxation—results in a lower level of national income because it redistributes disposable income from workers, whose saving propensity is low, to property owners, whose saving propensity is relatively high. *J. Post Keynesian Econ.*, Spring 1987, 9(3), pp. 424-39. Colgate University.

**Cross, Rod B.**—Hysteresis and Instability in the Natural Rate of Unemployment

In this paper, it is pointed out that the long-run Phillips curve genus contains upward and downward sloping species as well as the vertical species. Two models are used: in one the rate of inflation helps determine the natural rate of unemployment, as proposed by Milton Friedman; in the other the process of moving from one inflation rate to another helps shape the natural rate, according to the hysteresis effect proposed by Edmond Phelps. In both cases the resulting models are unstable, implying that a

vertical long-run Phillips curve will not be regained if disturbed. *Scand. J. Econ.*, 1987, 89(1), pp. 71-89. University of St. Andrews, Fife, Scotland.

**De Long, James Bradford and Summers, Lawrence H.**—Is Increased Price Flexibility Stabilizing?

This paper uses John Taylor's model of overlapping contracts to show that increased wage and price flexibility can easily be destabilizing because of the Mundell effect. While lower prices increase output, the expectation of falling prices decreases output. Simulations based on realistic parameter values suggest that increases in price flexibility might well increase the cyclical variability of output in the United States. *Amer. Econ. Rev.*, Dec. 1986, 76(5), pp. 1031-44. Harvard University.

**Elliott, John E. and Clark, Barry S.**—Keynes's *General Theory* and Social Justice

This paper examines four major aspects of Keynes's views on social justice as expounded in the *General Theory of Employment, Interest and Money*: (1) the criteria for Keynes's claim that wealth and income inequalities are excessive from the perspective of economic functionality; (2) Keynes's critique of interest income as nonfunctional; (3) Keynes's rejection of wage cutting as an antidepressionary strategy as unjust as well as inefficacious; (4) international implications of Keynes's contention that justice has positive, as well as normative, effects, making justice and efficacy complementary, is also adumbrated. *J. Post Keynesian Econ.*, Spring 1987, 9(3), pp. 381-94. University of Southern California; University of Wisconsin, La Cross.

**Ellis, Christopher J. and Fender, John**—Bargaining and Wage Resistance in an Open Macroeconomic Model

An open macroeconomic model where wages and employment are determined by bargaining between a representative firm and a representative union is developed. The model is characterized by a number of regimes; in each of these regimes the effects of changes in the terms of trade and in government expenditure on em-

ployment, the real wage and the balance of trade are analyzed. It is of particular interest that under certain circumstances real wage resistance is exhibited—that is, in response to a terms of trade deterioration, the real wage may not decline and may even increase. *Econ. J.*, Mar. 1987, 97(385), pp. 106–20. University of Oregon; Pennsylvania State University.

**Foster, Gladys Parker—Financing Investment**

The article analyzes two seemingly contradictory views on financing investment, both of which claim compatibility with Keynes's *General Theory*: the first, that aggregate investment generates aggregate saving and that therefore investment cannot be financed by prior saving and can only be financed by the creation of credit; and the second, that investment can be financed by prior saving as long as total output is not increasing and that therefore only increases in output require credit creation. The first view is found to be superior because the second is misleading if not inaccurate, but the difference is largely, perhaps entirely, semantic. *J. Econ. Issues*, Mar. 1987, 21(1), pp. 101–12. University of Colorado, Denver.

**Franke, Reiner—On the Upper- and Lower-Bounds of Workers' Propensity to Save in a Two-Class Pasinetti Economy**

In the two-class Pasinetti model it is asked in what range the propensities of workers to save permit the existence of an equilibrium if consumption of workers and capitalists is differentiated. In the multi-sectoral framework of quadratic Leontief techniques and production prices, an explicit upper bound is given. In particular, it depends on the consumption structure of workers, but not of capitalists. Whereas the lower bound is zero, this need not necessarily carry over to joint production systems, as is demonstrated by an example leading to two disjoint existence intervals. *Australian Econ. Pap.*, Dec. 1985, 24(45), pp. 271–77. University of Bremen, West Germany.

**Fuhrer, Jeffrey C.—Information Gathering and Expectation Formation under Model Uncertainty**

This paper integrates model uncertainty and information gathering into a single theory of

expectation formation. Agents learn about the true macroeconomic model and optimally choose whether and how much information to purchase. The model used to form expectations and the optimal amount of information gathered will depend critically upon the cost of information, prior assessments of the likelihood of competing models, the differences among the conditional distributions of the expectation variable implied by each model, and the potential economic loss from acting based upon an "incorrect" model. A simple economic model illustrates the expectation formation process. *Southern Econ. J.*, Jan. 1987, 53(3), pp. 685–701. Board of Governors of the Federal Reserve System.

**Greenwood, Jeremy and Huffman, Gregory W.—A Dynamic Equilibrium Model of Inflation and Unemployment**

A stochastic general equilibrium model is constructed which is capable of examining the covariance properties between inflation and unemployment, both conditioned and unconditioned upon the state of exogenous real and monetary factors. Indivisibilities introduced into agents' labor choice decisions produce unemployment in equilibrium. It is shown that indigenous forces in a competitive economy can result in the traditional negative relationship between inflation and unemployment. The policymaker, while perhaps observing a negatively sloped Phillips curve, actually faces Friedman's positively sloped one. *J. Monet. Econ.*, Mar. 1987, 19(2), pp. 203–28. University of Western Ontario and Rochester Center for Economic Research; University of Western Ontario.

**Hansson, Ingemar—Classical, Keynes' and Neoclassical Investment Theory—A Synthesis**

This paper presents an investment theory for the firm and the industry under rational expectations that encompasses: (1) classical capital theory; (2) a solid microeconomic basis for Keynes's investment theory; and (3) traditional neoclassical investment theory for the firm. These three types of investment theory are consequently complementary rather than contradictory. Classical capital theory is relevant for a comparative statics analysis of long-run equi-

libria. Keynes's investment theory is applicable for the determination of the industry's investment, given any expected paths for demand, supply, and technology. Neoclassical investment theory for the firm is relevant to analyze effects of changes that affect a single firm only. *Oxford Econ. Pap.*, July 1986, 39(2), pp. 305-16. University of Lund.

**Jones, Stephen R. G. and Stock, James H.**—Demand Disturbances and Aggregate Fluctuations: The Implications of Near Rationality

The paper investigates some properties of "near rational" models of the cycle, examining two types of framework. In the first, an otherwise classical, competitive economy is shown to respond to demand disturbances when some firms follow a near rational hiring policy. In the second model, a dynamic setting is addressed and a criterion termed "stochastic near rationality" is employed. Simulation results are consistent with recent empirical findings and suggest that further quantitative evaluation is merited. *Econ. J.*, Mar. 1987, 97(385), pp. 49-64. University of British Columbia; Harvard University.

**Knoester, Antonie**—Okun's Law Revisited

Okun's Law focuses on the Keynesian explanation of unemployment. A serious drawback is that it does not contain any explicit treatment of the classical causes of unemployment. This paper suggests an amendment to Okun's Law which will contain the real wage rate and the investment ratio. It has been shown for Germany, the Netherlands, the United Kingdom, and the United States that inclusion of the classical determinants of unemployment improves the statistical quality of Okun's Law substantially. *Weltwirtschaft. Arch.*, 1986, 122(4), pp. 657-66. Nijmegen University.

**Leach, John E.**—Optimal Portfolio and Savings Decisions in an Intergenerational Economy

An intergenerational economy in which transactions costs cause agents to diversify their portfolios is presented. Changes in the rate of monetary expansion lead to changes in the velocity of money. Earlier intergenerational models introduced this relationship in an *ad hoc* fashion by assuming that money yields direct utility.

The comparative statics of this model are significantly different from those of its predecessor. Greater inflation can lead to either a greater or a smaller capital intensity. The capital intensity corresponding to a constant money supply can be greater than, equal to, or less than golden rule capital intensity. *Int. Econ. R.* Feb. 1987, 28(1), pp. 123-34. McMaster University.

**Peston, M. H.**—The Elementary Macroeconomic Consequences of Differing Public and Private Sector Wages

This paper explores the macroeconomic consequences of differentiating public sector wage rates from private sector ones. It shows that within the usual comparative static macroeconomic model the effects of a reduction in money wages depend on which sector it happens in. This has significant consequences for incomes policy and the state of the government's budgetary position. *Public Finance*, 1986, 41(2), pp. 173-81. Queen Mary College, London.

**Rowe, Nicholas**—A Simple Macroeconomic Model with Monopolistic Firms

This paper presents a simple macroeconomic model in which firms outputs are imperfect substitutes, and explores the macroeconomic implications of monopolistic competition. The model is classical in some respects, but Keynesian in others. Multiple or unstable equilibria are not unlikely. Permanent price controls will, in principle, be desirable, since they allow a permanent and efficient increase in aggregate output. Small costs of price adjustment may induce large deviations of output from the natural rate. Fiscal policy will generally affect aggregate output, but the sign and magnitude of the government expenditure multiplier cannot be determined *a priori*. *Econ. Inquiry*, Jan. 1987, 25(1), pp. 83-102. Carleton University.

**Tobin, James**—The Future of Keynesian Economics

This paper was a dinner speech at the EEA meetings, marking the 50th birthday of Keynes's *General Theory*. Surveying contemporary macro controversy, the paper argues against "new classical" business cycle theories,

both "real" and "unreal," and criticizes "micro-foundations" methodology as Robinson Crusoe economics misapplied. Keynes's discussion of long-term expectation and investment is contrasted to "rational expectations" models. According to Keynes, investors and entrepreneurs face uncertain futures to which probability calculus cannot apply. Their attitudes toward the future are a source of exogenous fluctuations in investment and in economic activity, beyond the shocks of policies, tastes, and technologies other theorists recognize. *Eastern Econ. J.*, Oct.-Dec. 1986, 12(4), pp. 347-56. Yale University.

**Wadhvani, Sushil B.—The Macroeconomic Implications of Profit Sharing: Some Empirical Evidence**

This paper attempts an empirical assessment of Weitzman's proposition that profit sharing provides an antidote to stagflation. Taking Japan as an example of a profit-sharing economy, the author shows that it does not have either lower cyclical variability of output or lower inflation than other industrial countries. The authors then reject the propositions that in a profit-sharing economy: (1) aggregate demand shocks have a smaller effect on output deviations and (2) import price shocks and wage push have a smaller effect on inflation. Therefore, one should be wary of the claim that the Japanese case supports Weitzman's model. *Econ. J. Supp.* 1987, 97, pp. 171-83. London School of Economics.

**Weitzman, Martin L.—Steady State Unemployment under Profit Sharing**

This paper demonstrates how asymmetric treatment of high-seniority "insider" workers and non-tenured "outsiders" gives rise to bad macroeconomic steady states in a wage economy. The framework uses a Nash bargaining solution where workers may bargain over pay but firms control hiring. Profit sharing is then considered as an alternative payment mechanism having the automatically corrective incentive property that employers want to hire more outsiders. Given the assumptions of the model, it is shown that widespread profit sharing results in lower unemployment and more output even though it is individually rational for insid-

ers to prefer wages over profit shares. *Econ. J.*, Mar. 1987, 97(385), pp. 86-105. Massachusetts Institute of Technology.

**024 Welfare Theory**

**Davies, James B.—Does Redistribution Reduce Inequality?**

The steady-state effect on inequality of linear redistributive schemes based on the taxation of earnings, inheritances, or some combination of the two is examined. Dynasties that exhibit asexual reproduction and altruism are modeled. Earnings ability, which may be correlated across generations, is exogenous and drawn from a stationary distribution. Taxing inheritances increases inequality by reducing the intergenerational averaging of "luck." Taxing lifetime wealth or income adds a lump-sum tax on earnings, making redistribution more successful. However, this success is sensitive to the relative size of mean earnings and inheritances. *J. Lab. Econ.*, Oct. 1986, 4(4), pp. 538-59. University of Western Ontario.

**Ebert, Udo—Size and Distribution of Incomes as Determinants of Social Welfare**

The paper is concerned with the relationship between the inequality of income distributions and the social welfare they imply. Starting point is an ordering of income distributions in terms of inequality. Based on explicit value judgments about the trade-off between size and distribution of incomes, an ordering in terms of social welfare is derived. The welfare functions representing this ordering allow a size-distribution split up. It is shown that the procedure can be reversed. This ordinal approach is considerably more flexible and less arbitrary than most methods proposed in the literature. *J. Econ. Theory*, Feb. 1987, 41(1), pp. 23-33. University of Bonn.

**Hau, Timothy D.—Distributional Cost-Benefit Analysis in Discrete Choice**

The theory and practice of performing cost-benefit analysis in a distributional framework is explored within the discrete choice context. The social welfare methodology employed builds on the conventional Marshallian approach and the Hicksian approach to efficiency cost-benefit analysis developed by the author.

The theoretical framework is then applied to an eight-alternative demand-supply corridor simulation model of the San Francisco Bay Area. The equity impacts of a policy are analyzed by segmenting a sample according to income group and trip type. Various standard welfare functions are found to be particular parameterizations of a selected family of functional forms for distributional weights. *J. Trans. Econ. Policy*, Sept. 1986, 20(3), pp. 313-38. University of Hong Kong.

**Hickerson, Steven R.**—Instrumental Justice and Social Economics

In this paper, the intent is to identify the context and general nature of the social economics—instrumentalist contribution to the study and practice of economic justice. Arguing that the ethics and method of instrumentalism are consistent with the research agenda of social economics, the paper concludes that an instrumentalist conception of justice is also compatible with this agenda. Such a conception avoids the artificial dichotomization of means and ends implicit in the Rawls-Nozick debate, recognizing instead the logical inseparability of means and ends. A genuinely meaningful conceptualization of justice must address and integrate both process and distributive criteria. *Rev. Soc. Econ.*, Dec. 1986, 44(3), pp. 268-80. Mankato State University.

**Lane, John and Leininger, Wolfgang**—On Price Characterization and Pareto-Efficiency of Game Equilibrium Growth

A smooth aggregative model of economic growth is analyzed as a game between generations. The resulting (game-theoretic) equilibrium growth path is shown to give rise to a Pareto-efficient consumption stream. Specifically, the resolution of intertemporal conflicts by means of a (subgame) perfect Nash equilibrium of the game determines consumption and bequest behavior of each generation. For consumption and production programs resulting from differentiable equilibrium strategies a general and complete characterization in terms of "competitive" prices is given. From these prices one infers efficiency of the growth path and Pareto-efficiency of the corresponding consumption stream by standard methods. *J. Econ.*

(*Z. Nationalök.*), 1986, 46(4), pp. 347-67. London School of Economics; University of Bonn.

**Le Breton, Michael and Trannoy, Alain**—Measures of Inequality as an Aggregation of Individual Preferences about Income Distribution: The Arrowian Case

An inequality preorder is a preorder on a simplex that satisfies symmetry and strict Schur-convexity (the mathematical equivalent of the principle of transfers of A. C. Pigou and John Dalton). It is shown that individual inequality preorders cannot be aggregated to a collective one if we are interested in Kenneth Arrow's aggregation rules. The proof uses an interesting result of E. Kalai, E. Muller, and M. Satterthwaite (1979). Moreover, the authors prove further results for the aggregation of individual inequality indices when they allow cardinality and interpersonal comparability of utility. *J. Econ. Theory*, Apr. 1987, 41(2), pp. 248-69. University of Rennes and GREQE, France.

**Ruiz-Castillo, Javier**—Potential Welfare and the Sum of Individual Compensating or Equivalent Variations

The author investigates under which conditions the sign of the sum of both the individual compensating and equivalent variations correctly indicates changes in potential welfare. The author's results reproduce exactly those of Chipman and Moore for the National Income Test, which did not rely on individual measures of welfare directly related to consumers' preferences: (1) a necessary and sufficient condition for the new test to be valid is that individual preferences are identical and homothetic; and (2) if the distribution of income is constant and preferences are homothetic, then the new test is valid only if preferences are also identical. *J. Econ. Theory*, Feb. 1987, 41(1), pp. 34-53. Universidad Complutense de Madrid, Pozuelo, Espana.

**Sah, Raaj Kumar**—Queues, Rations, and Market: Comparisons of Outcomes for the Poor and the Rich

This paper presents a positive comparison of the outcomes of several alternative allocation systems (the queue system, convertible and

nonconvertible rations, and the unhindered market) to distribute the limited quantity of a deficit good among heterogeneous individuals. The authors show that, for the poor, the ranking of systems (from better to worse) is: convertible rations, nonconvertible rations, the queue system, and nonintervention. The rich are found to be better off under nonintervention than under other systems. These and other results are notably robust not only to many parameters of the economy, but also to certain types of commodity taxes and administrative costs. *Amer. Econ. Rev.*, Mar. 1987, 77(1), pp. 69-77. Yale University.

**Scoggins, John Franklin—Welfare Evaluation and Household Production with Non-constant Returns to Scale**

This paper modifies Shephard's lemma and Roy's identity to allow for a nonlinear budget constraint when measuring exact consumer's surplus. The nonlinear budget constraint can arise when a good is produced by a household with a nonconstant returns to scale technology. Functions analogous to Marshallian and income-compensated demand are derived. This model is useful in measuring the exact welfare effects of government induced changes in the prices or levels of household production factors. An example of this would be an energy conservation program that induces greater purchases of ceiling insulation than would otherwise occur. *Southern Econ. J.* Jan. 1987, 53(3), pp. 643-49. California State University, Long Beach.

**Slesnick, Daniel T.—Welfare Distributional Change and the Measurement of Social Mobility**

A new approach to the measurement of welfare distributional change and social mobility is developed. The novel feature of this model is the use of price dependent measures of individual and social welfare in evaluating the magnitude and direction of the movement in the distribution. In addition, the proposed indexes of mobility are decomposed into the sum of between-group and within-group mobility. Each measure is implemented for the United States over the period 1947-1982. It is found that in each year society is upwardly mobile

relative to the 1947 distribution. *Rev. Econ. Statist.*, Nov. 1986, 68(4), pp. 586-93. University of Texas.

**Vaughan, R. N.—Welfare Approaches to the Measurement of Poverty**

A set of poverty indices is constructed which is based on an explicit view of the loss of social welfare which results from the existence of poverty, in comparison to a society in which poverty has been eliminated. The indices are based on the entire distribution of income, rather than only the incomes of the poor, and thus embody the concept of relative deprivation. Formal properties of the indices are developed, together with their relationship to welfare based inequality indices; both are seen as subsets of a wider choice of measures dependent on a particular choice of "reference" distribution. *Econ. J.*, Supp. 1987, 97, pp. 160-70. University College, London.

**Vega-Redondo, Fernando—Efficiency and Nonlinear Pricing in Nonconvex Environments with Externalities: A Generalization of the Lindahl Equilibrium Concept**

It is a well known fact that if damaging externalities occur, nonconvexities will necessarily arise in the underlying economic environment rendering questionable the relevance of standard market approaches to the allocation problem. In response to this state of affairs, the author defines and studies a generalization of the Lindahl Equilibrium concept that allows for nonlinear pricing systems in which the marginal outlay may depend on the quantity purchased. This "Generalized Lindahl Equilibrium" attains local Pareto efficiency for its associated allocations and is able to support (in the usual sense) any Pareto-efficient allocation that satisfies a regularity condition. *J. Econ. Theory*, Feb. 1987, 41(1), pp. 54-67. Universidad Autonoma de Barcelona and University of Alicante and Instituto de Analisis Económico CSIC.

**025 Social Choice**

**Atkinson, Anthony B.—James M. Buchanan's Contributions to Economics**

This survey of James M. Buchanan's contributions to economics is divided into eight main categories: the influence of Knut Wicksell and

the pure theory of government finance; the Italian tradition and the burden of national debt; the calculus of consent; application of the public choice approach; application to public finance; public goods and clubs; fiscal constitutions; and the reason of rules. A bibliography of Buchanan's publications, 1949 to 1986, concludes the survey. *Scand. J. Econ.*, 1987, 89(1), pp. 5-15. London School of Economics and Political Science.

**Nelson, Douglas and Silberberg, Eugene**—Ideology and Legislator Shirking

The authors argue that legislator shirking (voting on the basis of personal ideology rather than the interests of one's constituents) can exist, but its appearance should conform to the law of demand. They test and confirm this theory using votes on defense expenditure bills in the U.S. Senate in 1982. The authors assume the cost of shirking is relatively higher on narrowly focused bills on specific weapons systems with well-defined beneficiaries, and relatively lower on general defense expenditure bills with uncertain final distribution of funds. Greater influence for senators' ideology in general versus specific bills is found. *Econ. Inquiry*, Jan. 1987, 25(1), pp. 15-25. U. S. Air Force Academy, Colorado Springs, Colorado; University of Washington.

**Saari, Donald G.**—The Source of Some Paradoxes from Social Choice and Probability

The geometric property of open sets being mapped to open sets is used to explain, unite, and extend several paradoxes coming from probability and social choice. In this way, several new results about the intransitivities of election rankings, the cycles of agenda manipulation, gambling, waiting times, and Simpson's paradox from conditional probability are obtained. *J. Econ. Theory*, Feb. 1987, 41(1), pp. 1-22. Northwestern University.

**Saltzman, Gregory M.**—Congressional Voting on Labor Issues: The Role of PACs

The author finds that the contributions of both labor and corporate political action committees (PACs) had a significant direct effect on the roll-call voting of members of the House of Representatives on labor issues in 1979-80,

even controlling for the Representative's political party and characteristics of the constituency. Since PAC money also affects roll-call voting indirectly (by influencing which party wins elections), its overall impact is probably substantial. The author also finds that labor PACs have focused more on influencing election outcomes than on carrying favor with powerful members of the House whose reelection is likely. *Ind. Lab. Relat. Rev.*, Jan. 1987, 40(2), pp. 163-79. Albion College and University of Michigan.

**van Velthoven, Ben and van Winden, Frans**—Social Classes and State Behavior

The paper studies the endogenization of state behavior in macroeconomic modeling, using the so-called interest function approach. The state is considered as a complex organization whose actions are, *inter alia*, determined by the interests of the different social classes and by their relative power vis-à-vis the state. The textbook Keynesian model is transformed into a politico-economic model. The dynamic version of the model takes account of the effect on state behavior of changes in the social power structure due to developments in the economic process. *J. Inst. Theoretical Econ.*, Sept. 1986, 142(3), pp. 542-70. Leyden University, Netherlands; University of Amsterdam.

**026 Economics of Uncertainty and Information; Game Theory and Bargaining Theory**

**Allen, Beth**—Smooth Preferences and the Approximate Expected Utility Hypothesis

Mild smoothness conditions on continuous complete preorders over lotteries imply that various local versions of the expected utility hypothesis are satisfied—i.e., for small deviations, there is a utility (representing the individual's preferences) that is linear in probabilities. For these results, notions of smooth preferences over an infinite dimensional set of probability measures are developed. *J. Econ. Theory*, Apr. 1987, 41(2), pp. 340-55. University of Pennsylvania.

**Aoki, Masahiko**—Horizontal vs. Vertical Information Structure of the Firm

This paper compares the efficiency of two information structures of the firm in coordinating

operational decisions among technologically-interrelated constituent units (shops) whose costs are uncertain. The structures compared are a hierarchical one in which the capability of management to monitor and respond to emergent events at the shop level is bounded; and a horizontal one in which production decisions are coordinated among shops without the centralization of information, but the capability of semiautonomous problem-solving by component units improves over time through learning-by-doing and better uses of on-the-spot knowledge. A comparison of Japanese and American practices precedes the analysis. *Amer. Econ. Rev.* Dec. 1986, 76(5), pp. 971-83. Stanford University and Kyoto University.

**Aumann, Robert J.—Correlated Equilibrium as an Expression of Bayesian Rationality**

If it is common knowledge that the players in a game are Bayesian utility maximizers who treat uncertainty about other players' actions like any other uncertainty, then the outcome is necessarily a correlated equilibrium. Random strategies appear as an expression of each player's uncertainty about what the others will do, not as the result of willful randomization. Use is made of the common prior assumption, according to which differences in probability assessments by different individuals are due to the different information that they have (where "information" may be interpreted broadly, to include experience, upbringing, and genetic makeup). *Econometrica*, Jan. 1987, 55(1), pp. 1-18. Hebrew University.

**Barzel, Yoram—Knight's "Moral Hazard" Theory of Organization**

In this paper the author suggests that besides Frank Knight's well recognized "uncertainty" explanation of the firm, he had another one. "Moral hazard" is the central feature in the second, largely overlooked theory. The author argues, and attempts to document, that this theory is not a chance excursion but is rather quite well developed by Knight. *Econ. Inquiry*, Jan. 1987, 25(1), pp. 117-20. University of Washington.

**Eichenbaum, Martin S. and Peled, Dan—Capital Accumulation and Annuities in an Adverse Selection Economy**

This paper suggests that adverse selection problems in competitive annuity markets can generate quantity-constrained equilibria in which some agents, whose length of lifetime is uncertain, find it advantageous to accumulate capital privately. This occurs despite the higher rates of return on annuities. The welfare properties of these allocations are analyzed. It is shown that the level of capital accumulation is excessive in a Paretian sense. Policies that eliminate this inefficiency are discussed. *J. Polit. Econ.*, Apr. 1987, 95(2), pp. 334-54. Carnegie-Mellon University; Carnegie-Mellon University and Technion, Haifa, Israel.

**Engers, Maxim and Fernandez, Luis F.—Market Equilibrium with Hidden Knowledge and Self-selection**

The problem of the existence of a competitive equilibrium in models with hidden knowledge and self-knowledge has been discussed previously by M. Rothschild and J. E. Stiglitz (1976), C. A. Wilson (1977), and J. G. Riley (1979). Recent analyses of such models by I. Cho and D. Kreps (1986) and Riley argue for a particular outcome—the Pareto-dominant separating, zero-profit one. The authors prove the existence of such an outcome under very general conditions and, generalizing the reactive equilibrium concept introduced by Riley, they prove this outcome is the unique reactive equilibrium. *Econometrica*, Mar. 1987, 55(2), pp. 425-39. University of Virginia; Oberlin College.

**Fraser, R. W.—Uncertainty and Production Quotas**

The introduction of a quota with a risk-neutral producer will lead to a reduction in planned production. Also, uncertainty influences planned production indirectly in a situation where over-quota production can be sold in an uncertain export market. The direction of this influence depends on the relationship between the producer's uncertainties of price and production. The welfare assessment of the impact of production quotas must incorporate the role of uncertainty. *Econ. Rec.*, Sept. 1986, 62(178), pp. 338-42. University of Western Australia, Nedlands.

**Green, Jerry R. and Laffont, Jean-Jacques—**  
Posterior Implementability in a Two-Person  
Decision Problem

When a decision rule is implemented using a Bayesian incentive compatible mechanism in which the messages are publically observable, the players' information is augmented by their observation of each others' strategies. In this paper the authors study the set of Bayesian implementable decision rules which have the further property that the information conveyed in the process of thier implementation does not invalidate the optimality of the players' strategies. Such rules are called *posterior implementable*. The authors concentrate on a two-person problem with two possible decisions and, for this problem, they obtain a complete characterization of the set of posterior implementable decision rules. *Econometrica*, Jan. 1987, 55(1), pp. 69-94. Harvard University; GREMAQ, Toulouse, France.

**Harris, Christopher and Vickers, John—**  
Racing with Uncertainty

The paper presents two models of races in which there is both technological uncertainty and strategic interaction between competitors. The authors' aim is to see how the efforts of competitors in a race vary with the intensity of rivalry between them. In the principal model, which is of a one-dimensional race, it is shown that the leader in the race makes greater efforts than the follower, and efforts increase as the gap between competitors decreases. Under certain conditions the same results hold in the second related model, which is of a two-dimensional race. *Rev. Econ. Stud.*, Jan. 1987, 54(1), pp. 1-21. Nuffield College, Oxford.

**Holmstrom, Bengt and Milgrom, Paul—**  
Aggregation and Linearity in the Provision of Inter-  
temporal Incentives

The authors develop two themes in the theory of incentive schemes. First, one need not always use all of the information available in an optimal incentive contract. Accounting information, which aggregates performance over time, is sufficient for optimal compensation schemes in certain classes of environments. Second, optimal rules in a rich environment

must work well in a range of circumstances and cannot, therefore, be complicated functions of the observed outcome. The authors illustrate these ideas in a particular model where the agent has a rich space of controls, showing that the unique optimal compensation scheme is a linear function of profits. *Econometrica*, Mar. 1987, 55(2), pp. 303-28. Yale University.

**Jewitt, Ian—**Risk Aversion and the Choice be-  
tween Risky Prospects: The Preservation of  
Comparative Statics Results

Most results in the comparative statics of risk aversion are obtained when there is only one source of uncertainty. The primary example is that more risk-averse people are willing to pay a higher premium of insuring against risk. It is known that the results do not generally carry over when there is another source of uncertainty. The paper develops conditions under which comparative statics results are robust against the introduction of additional sources of uncertainty. *Rev. Econ. Stud.*, Jan. 1987, 54(1), pp. 73-85. University of Bristol.

**Karni, Edi—**Generalized Expected Utility  
Analysis of Risk Aversion with State-Depen-  
dent Preferences

In this paper the author develops measures of absolute risk aversion for preference relations on risky prospects that are state-dependent and are representable by Frechet differentiable, nonlinear, functionals. A comparative statics analysis of optimal air travel insurance coverage illustrates the usefulness of the proposed measures. It is also demonstrated that the analytical framework described above is consistent with the purchase of air travel insurance even in circumstances where expected utility theory is not. *Int. Econ. Rev.*, Feb. 1987, 28(1), pp. 229-40. Johns Hopkins University.

**LeRoy, Stephen F. and Singell, Larry D.,**  
Jr.—Knight on Risk and Uncertainty

It is argued that the received interpretation of Frank Knight's (1921) classic risk-uncertainty distinction—as concerning whether or not agents have subjective probabilities—constitutes a misreading of Knight. On the contrary, Knight shared the modern view that agents can

be assumed always to act as if they have subjective probabilities. The authors document their contention that by uncertainty Knight instead meant situations in which insurance markets collapse because of moral hazard or adverse selection. Knight's discussion of market failure, although always informal and in places inaccurate, was in many respects a remarkable anticipation of the modern literature. *J. Polit. Econ.*, Apr. 1987, 95(2), pp. 394-406. University of California, Santa Barbara and University of California, Berkeley; University of California, Santa Barbara.

**Lippman, Steven A.; Mamer, John W. and McCardle, Kevin F.**—Comparative Statics in Non-cooperative Games via Transfinitely Iterated Play

A. Tarski's fixed point theorem establishes the existence of a Nash equilibrium when (1) each player's lattice of strategies is complete and (2) the composite best response function is isotone. Supposing the composite best response function is also isotone in one of the underlying parameters, then the transfinite variant of iterated best response play is shown to "converge" and to produce an unambiguous comparative statics analysis. The efficacy of this approach is demonstrated with three examples. *J. Econ. Theory*, Apr. 1987, 41(2), pp. 288-303. University of California, Los Angeles; University of California, Los Angeles; Duke University.

**Loomes, Graham and Sugden, Robert**—Testing for Regret and Disappointment in Choice under Uncertainty

Much of the experimental evidence concerning violations of von Neumann-Morgenstern expected utility theory has been collected from experiments designed with conventional theory in mind and does not provide direct tests of alternative models such as regret theory and disappointment theory. This paper reports and discusses recent evidence produced by an experiment specifically designed to test for the impacts of regret and disappointment, and to indicate their relative importance. *Econ. J.*, Supp. 1987, 97, pp. 118-29. University of York; University of East Anglia.

**Röell, Ailsa A.**—Risk Aversion in Quiggin and Yaari's Rank-Order Model of Choice under Uncertainty

This paper studies the rank-dependent model of choice under uncertainty proposed by J. Quiggin in 1982 and elaborated by M. E. Yaari in 1984. First, a rigorous axiomatic foundation for the model is provided. A very close analogy with expected utility theory is drawn, permitting a considerably simplified treatment. Risk aversion and its measurement are then studied; two characterizations, one weaker and one stronger, are presented in addition to the one considered by Yaari. Lastly, risk aversion and other properties of the model are related to empirically observed departures from expected utility maximizing behavior. *Econ. J.*, Supp. 1987, 97, pp. 143-59. London School of Economics.

**Segal, Uzi**—The Ellsberg Paradox and Risk Aversion: An Anticipated Utility Approach

The paper describes a decision process under which it is rational to prefer a lottery with known probabilities to a similar ambiguous lottery where the decision maker does not know the exact values of the probabilities (the "Ellsberg paradox"). This is done by modeling ambiguous lotteries as two-stage lotteries, by assuming the independence axiom without the reduction of compound lotteries axiom, and by using the anticipated utility functional. This paper also gives conditions under which less ambiguity is preferred and presents some comparative statics analysis as well as some interpersonal comparisons. Finally, it proves that within the anticipated utility framework, risk and ambiguity are almost identical. *Int. Econ. Rev.*, Feb. 1987, 28(1), pp. 175-202. University of Toronto.

**Williams, Steven R.**—Efficient Performance in Two Agent Bargaining

This paper concerns *ex ante* incentive efficient performance in the bargaining of one buyer and one seller over a single item. For any element in a specified class of distributions of the buyer's and the seller's valuations of the item, all of the (interim) individually rational and efficient allocation rules are characterized. It is also shown that the "buyer's bid" and the "seller's price" double auctions are efficient for

all distributions in the specified class. These results are obtained by studying efficiency as a linear programming problem. *J. Econ. Theory*, Feb. 1987, 41(1), pp. 154-72. Northwestern University.

**Yaari, Menahem E.—The Dual Theory of Choice under Risk**

This paper investigates the consequences of the following modification of Expected Utility theory: instead of requiring independence with respect to probability mixtures of risky prospects, require independence with respect to direct mixing of payments of risky prospects. A new theory of choice under risk—a so-called Dual theory—is obtained. Within this new theory, the following questions are considered: (1) numerical representation of preferences; (2) properties of the utility function; (3) the possibility for resolving the "paradoxes" of Expected Utility theory; (4) the characterization of risk aversion; and (5) comparative statics. The paper ends with a discussion of other non-Expected Utility theories proposed recently. *Econometrica*, Jan. 1987, 55(1), pp. 95-115. Institute for Advanced Studies, Hebrew University.

**027 Economics of Centrally Planned Economies**  
**Haruna, Shoji—Random Input Price and the Theory of the Competitive Cooperative Firm**

This paper examines a competitive cooperative firm under input price uncertainty, comparing it with a capitalist firm. The author shows that the firm with input price uncertainty produces output with a smaller capital-labor ratio than that of the certainty equivalent twin. Further, it is shown that the effects of a change in uncertainty on capital, labor, and output are the same as the effects of a change in wage; however, the effects of output price changes are exactly the opposite. In general, results cannot be inferred concerning the behavior of the cooperative firm from the behavior of the capitalist firm. *J. Compar. Econ.*, Mar. 1987, 11(1), pp. 81-95. Ohita University, Japan.

**030 HISTORY OF ECONOMIC THOUGHT;  
METHODOLOGY**

**031 History of Economic Thought**

**Anlt, Richard W. and Ekelfund, Robert B., Jr.—The Problem of Unnecessary Originality in Economics**

The role of the "literature search" in the creative process of theory development is the subject of this paper. Using a case study from the theory of public utilities (peak-load pricing), the paper develops a "positive" economic approach to the subject of originality by identifying some of the costs and benefits of the practice of the methods of the intellectual historian. The paper concludes that use of these methods, together with changes in reviewing procedures, tenure laws, etc., would have a predictable and beneficial impact of eliminating unnecessary originality in the development of economic theory. *Southern Econ. J.*, Jan. 1987, 53(3), pp. 650-61. Auburn University.

**Baron, Samuel H.—Was Križanić a Mercantilist?**

This paper concerns the economic thought of Križanić (1618-1683) with regard to Muscovite Russia, as set forth in his *Politika*. The conclusion: Križanić was a mercantilist, but of a particular kind. Mercantilism varied a good deal according to time, place, and expositor. The mercantilism of Križanić has much in common with that found elsewhere in Europe, but it also has special features, which derive from the facts that: (1) as a priest, he was steeped in Catholic thought; and (2) Muscovite Russia was an exceptionally backward country vis-à-vis most of Europe in the seventeenth century. *Hist. Polit. Econ.*, Spring 1987, 19(1), pp. 67-86. University of North Carolina.

**Bodily, Christopher L.—Henry David Thoreau: The Instrumental Transcendentalist?**

Both New England transcendentalism and institutionalism are unique strands of the American intellectual tradition. This essay attempts to open a dialogue between these traditions and to explore the possibility of including Henry David Thoreau in the rich heritage of institutional thought. The pivotal role of intuition emerges from a discussion of the similarities between the transcendental principles of Thoreau's life and work and the development of the instrumental theory of value within institutionalism. This essay concludes that if there is room for intuition within instrumentalism, then there is room for Thoreau in the history of institutional thought. *J. Econ. Issues*, Mar. 1987,

21(1), pp. 203-18. University of California, Santa Cruz.

**Bostaph, Samuel and Shieh, Yeung-Nan—Jevons's Demand Curve**

Historians of the early development of mathematical economics have questioned W. S. Jevons's claim of priority over Fleeming Jenkin in the use of graphic demand and supply curves. This article argues that Jevons has general priority in that, using applied econometrics, he derived and presented the long-run demand curve for corn in his classes at Owens College before Jenkin published his own graphic and hypothetical short-run supply and demand analysis. The article also provides some insight into Jevons's conception of demand and supply relations and how they differed from those of A. A. Cournot, J. Dupuit, and A. Marshall. *Hist. Polit. Econ.*, Spring 1987, 19(1), pp. 107-26. University of Dallas, Irving; University of Alaska, Fairbanks.

**Cookingham, Mary E.—Social Economists and Reform: Berkeley, 1906-1961**

This article traces the origin, growth and significance of social economy within the Berkeley economics department. At Berkeley this was a subfield within economics for over twenty years. These social economists were extremely active in legislative reform and in the collection of socioeconomic data. They were involved in all aspects of the economics department and interacted with other members of the department in research throughout the department's formative years. While not a comprehensive history of the department, this article highlights much of its history, including its recruitment policies, its relationship with Wisconsin, and the California Oath Controversy of the early 1950s. *Hist. Polit. Econ.*, Spring 1987, 19(1), pp. 47-65. Michigan State University.

**Ekelund, Robert B. Jr. and Shieh, Yeung-Nan—Dupuit, Spatial Economics, and Optimal Resource Allocation: A French Tradition**

This paper uncovers and develops nineteenth-century engineer Jules Dupuit's pivotal role in the independent French tradition in spatial economic analysis. Dupuit's invention of market area studies and (approximately first-de-

gree) spatial price discrimination is illustrated with a simple mathematical model. Next, Dupuit's conception of optimal toll structures and their relation to efficient transport systems, regulation, and economic welfare is analyzed and shown to contain a remarkably modern case for transport deregulation. The paper also assesses Dupuit's role in the development of spatial economics and in the French contribution to the location paradigm in microeconomic analysis. *Economica*, Nov. 1986, 53(212), pp. 483-96. Auburn University.

**Gilbert, Geoffrey N.—W. F. Lloyd and Socialism: A Note**

The question has been raised whether, in the writings of English classical economist W. F. Lloyd (1794-1852), there are "foreshadowings of socialist thought." Textual evidence has been produced on both sides of the issue. This note cites evidence previously overlooked and finds Lloyd highly skeptical toward "systems of equality" on three grounds: lack of work incentives, waste of resources, and tendency toward overpopulation. Lloyd's 1837 critique of the equalitarian principle, though condensed and abstract, is actually more encompassing than that of his better-known predecessor, Malthus. *Australian Econ. Pap.*, June 1986, 25(46), pp. 144-46. Hobart and William Smith Colleges.

**Kleiman, Ephraim—'Just Price' in Talmudic Literature**

The *Ona'a* ("overreaching") rule is the Talmudic forerunner of the *justum pretum* of medieval scholastic thought. To the Rabbinical sages, overreaching consisted of a significant departure from the law of the one price. The rule was motivated by a wish to prevent inequality of information from having distributional effects. But an analysis of the different opinions as to what constitutes an infringement, and of some associated rules, makes it possible to identify the underlying conceptualization of markets and prices. The Talmudic discussion reveals rudimentary protoeconomic theorizing, reflecting the conditions of the predominately agricultural society in which it evolved. *Hist. Polit. Econ.*, Spring 1987, 19(1), pp. 23-45. Hebrew University, Jerusalem.

**Hamada, Koichi**—The Impact of the *General Theory* in Japan

The *General Theory* was introduced to Japan immediately after its publication, and its Japanese translation published in 1941 sold nearly 9,000 copies. The influence of the textbook version of Keynesian economics began after World War I. This paper describes the strong impact of Keynesian economics on Japanese academics where the influence of neoclassical economics had not been so strong until the 1960s. Policy makers also accepted the analytical framework of Keynesian thinking, but actual policy formation may not have been strongly conforming to the Keynesian policy prescriptions, because of various constraints like the balanced budget principle. *Eastern Econ. J.*, Oct.–Dec. 1986, 12(4), pp. 451–66. Yale University.

**Larson, Bruce**—Bickerdike's Life and Work

This paper relates the principle details of the life and work of Charles Frederick Bickerdike (1876–1961). Bickerdike is shown to have made significant contributions to tariff theory, the acceleration principle, the multiplier, growth theory, and the analysis of external effects. These writings were principally influenced by the work of F. Y. Edgeworth and A. C. Pigou. As Bickerdike's work foreshadowed later developments in British economics, it is suggested that further study of Edgeworth and Pigou will yield a more continuous view of the development of British economics. *Hist. Polit. Econ.*, Spring 1987, 19(1), pp. 1–21. University of North Carolina, Asheville.

**Mattson, Vernon and Tilman, Rick**—Thorstein Veblen, Frederick Jackson Turner, and the American Experience

This paper compares the strikingly different views and attitudes toward America of Frederick Jackson Turner (1861–1932) and Thorstein Veblen (1857–1929). Although these scholars were among the most influential American thinkers of their time and in particular were sometimes lumped together as influential progressives in the period 1901–16, heretofore no systematic effort has been made to contrast their respective "progressive" and "radical" views of the American experience. This com-

parative treatment offers instructive perspectives for assessing the contributions and significance of these social theorists. *J. Econ. Issues*, Mar. 1987, 21(1), pp. 219–35. University of Nevada, Las Vegas.

**Mumy, Gene E.**—Silences in Ricardo: Comparative Advantage and the Class Distribution of Free Trade Benefits

David Ricardo's theory of economic growth depends crucially on his theory of the distribution of output among the three major economic classes he designates. Interestingly, however, his analysis of the gains from free trade based on comparative advantage is carried out in the supra-class terms of augmenting a nation's riches. The purpose of this paper is to examine the class distribution of free trade benefits in a manner consistent with Ricardo's growth theory. In this context, it is shown that free trade is not necessarily advantageous for a country's economic growth and the welfare of a considerable part of its population. *Rev. Soc. Econ.*, Dec. 1986, 44(3), pp. 294–305. Ohio state University.

**Perlman, Morris**—Of a Controversial Passage in Hume

David Hume's (1955) analysis of how a change in the quantity of money can have a temporary effect on real income has been variously interpreted and misinterpreted for over two hundred years. A possible reason for some misinterpretation is Hume's archaic use of the term "labor." With the correct interpretation, which is consistent with Hume's other theories and in particular his theory of the interest rate, the reason for the temporary effect on real income is that prices lag behind money wages, and a rise in real wages leads to an increased supply of effort. *J. Polit. Econ.*, Apr. 1987, 95(2), pp. 274–89. London School of Economics.

**Pullen, John M.**—Some New Information on the Rev. T. R. Malthus

Letters, testimonials, and other documents contained in the Winchester diocesan records, but hitherto unpublished, throw light on the circumstances of Malthus's clerical career and on the orthodoxy of his theological opinions. *Hist. Polit. Econ.*, Spring 1987, 19(1), pp. 127–

40. University of New England, Armidale, Australia.

**Rashid, Salim**—Historical Notes on the Origins of Supply-Side Economics and Its Ethical Roots: Say's Law, Smith's Law, or Moral Law?

It is argued in this essay that the primary theoretical assumption supporting supply-side economics is the assumption of full-employment. A variety of historical instances are provided to demonstrate that this assumption has long been recognized as a critical one. The historical dominance of the supply-side view is then traced to its ethical underpinnings. *Quart. Rev. Econ. Bus.*, 26(4), pp. 22-34. University of Illinois.

**Reid, Gavin C.**—Disequilibrium and Increasing Returns in Adam Smith's Analysis of Growth and Accumulation

Smithian growth is seen as having at its core a sectoral model, with many, if not all, sectors subject to increasing returns, and growth taking place at a rate which is variable through time and across sectors, in response to disequilibria. The final outcome of all this is stationarity. The division of labor modifies linearly homogeneous production functions so that they exhibit increasing returns; this effect is modeled explicitly. It is then used to extend the Young-Kaldor analysis of Smithian growth. *Hist. Polit. Econ.*, Spring 1987, 19(1), pp. 87-106. University of Edinburgh.

**Rima, Ingrid H.**—The Pigou-Keynes Controversy about Involuntary Unemployment: A Half-Century Reinterpretation

This paper reexamines the controversy between Keynes and Pigou to reaffirm the basis for the concept of involuntary unemployment. Keynes's argument was that an inflationary policy to cut real wages will affect the labor market perversely because the real wage does not measure the marginal disutility of labor. A real wage cut calls forth an increased labor supply (appropriately represented by a rightward shift of the supply curve) as workers try to preserve conventional living standards at higher prices. Unless the real wage cut increases the aggregate demand for labor sufficiently to provide em-

ployment for the increased supply, there will be unemployment which is involuntary in the Keynesian sense. *Eastern Econ. J.*, Oct.-Dec. 1986, 12(4), pp. 467-77. Temple University.

**Tilman, Rick**—Grace Jaffé and Richard Ely on Thorstein Veblen: An Unknown Chapter in American Economic Thought

One chapter of Richard Ely's unpublished manuscript *The Story of Economics in the United States* was a collaborative effort with Grace Jaffé on the subjective of Thorstein Veblen. While finding much of value in Veblen's writings, they criticized him from the perspective of liberal reformism. His radical critique of neoclassical economics and American capitalism was too extreme, and his empirically valid insights and value-laden doctrines were so interwoven as to seriously compromise the scientific integrity of his theories. His work would have more lasting value had he acted less as a propagandist and more as a scientific economist. *Hist. Polit. Econ.*, Spring 1987, 19(1), pp. 141-62. University of Nevada, Las Vegas.

#### 036 Economic Methodology

**Arouh, Albert**—The Mumpsimus of Economists and the role of Time and Uncertainty in the Progress of Economic Knowledge

Radical change in economic theory has found stubborn resistance (what Joan Robinson has called "mumpsimus") from orthodox economists. Despite Keynes's revolutionary theories concerning time and uncertainty, the neoclassical synthesis regressed to a new classical world of timelessness and near certainty. Such resistance cannot be justified either by appeals to instrumentalism and innocuous falsificationism, or by appeals to criteria of progress implied in I. Lakatos and L. Laudan. If uncertainty (as distinguished from risk) means inherent instability, then it has subversive ideological connotations, which is why its use in economic theory is resisted. *J. Post Keynesian Econ.*, Spring 1987, 9(3), pp. 395-423. American College of Greece, Athens.

#### 040 ECONOMIC HISTORY

##### 041 Economic History: General

**Clark, Gregory**—Why Isn't the Whole World Developed? Lessons from the Cotton Mills

In 1910 one new England cotton textile operative performed as much work as 1.5 British, 2.3 German, and nearly 6 Greek, Japanese, Indian, or Chinese workers. Input substitution and differences in technology, management, and workers' training or inherent abilities do not explain this. Instead, local culture seems to have determined worker performance. Such differences, if widespread, would explain much of the international variation in wages. They also have important consequences for understanding labor migration, the choice of technique, and the sources of economic growth. *J. Econ. Hist.*, Mar. 1987, 47(1), pp. 141-73. Stanford University.

**Meiners, Roger E. and Nardinelli, Clark—**What Has Happened to the New Economic History?

The new economic history, or cliometrics, has transformed the study of economic history in recent decades. The two main branches of cliometrics, economic history and the property rights approach, both emphasize the application of explicit theory to historical events. The result has been substantial and sometimes startling revisions of conventional historical wisdom. Despite its successes, the new economic history has been criticized vigorously and has seen its influence with historians and economists decline. The authors offer an explanation for that decline. *J. Inst. Theoretical Econ.*, Sept. 1986, 142(3), pp. 510-27. Clemson University.

#### 042 Economic History: United States and Canada

**Lewis, Frank and MacKinnon, Mary—**Government Loan Guarantees and the Failure of the Canadian Northern Railway

The failure of the Canadian Northern Railway is analyzed with a model of optimal capital structure drawn from finance theory. *Ex ante* bankruptcy probabilities, which are computed on the basis of different assumptions about investors' expectations, range from 40 to 90 percent; and the authors' best estimate is about 70 percent. These high probabilities were a consequence of loan guarantees provided to the Canadian Northern by the federal and provincial governments. The guarantees induced the railway's promoters to undertake an *ex ante* un-

profitable project and to finance that project almost exclusively with debt. *J. Econ. Hist.* Mar. 1987, 47(1), pp. 175-96. Queen's University.

**Mills, Geoffrey and Rockoff, Hugh—**Compliance with Price Controls in the United States and the United Kingdom during World War II

The authors are concerned here with the evasion of price controls in the United States and the United Kingdom during World War II. The evidence suggests that controls produced less evasive activity in the United Kingdom. After considering several explanations they conclude that the key was the degree of regimentation. The British controlled all stages of production, limited the range of products available at each stage, and allocated relatively more resources to managing and enforcing controls. *J. Econ. Hist.*, Mar. 1987, 47(1), pp. 197-213. University of Northern Iowa, Cedar Falls; Rutgers University.

**Whitley, Warren C.—**Southern Agrarian Labor Contracts as Impediments to Cotton Mechanization

The traditional view of cotton mechanization, first advanced by rural sociologists in the 1920s, is that Southern agrarian institutions impeded progress. Recently their view has been questioned. New studies attribute much of the Southern lag to factors like small-scale production, cheap labor, the cotton crop, and environment. The author contributes to the debate by emphasizing how the structure of the Southern economy encouraged landlords to use annual labor contracts that hindered attempts to mechanize. He presents evidence that supports the traditional view and suggests how the incentive structure of annual labor contracts delayed invention of the mechanical cotton picker. *J. Econ. Hist.*, Mar. 1987, 47(1), pp. 45-70. University of Michigan.

#### 044 Economic History: Europe

**Heim, Carol E. and Mirowski, Philip—**Interest Rates and Crowding-out during Britain's Industrial Revolution

Available evidence on interest rates and government borrowing during Britain's industrial

revolution, while limited, does not support the idea that war spending crowded out private investment. This article demonstrates the importance of using data on net receipts from borrowing, rather than changes in government debt. Weaknesses of the crowding-out model concerning capital markets and investment, openness of the economy, and full employment are identified for the historical case. The case raises broader issues of whether conceptions of saving and investment based on neoclassical supply-constrained models are as appropriate as theories of capital accumulation. *J. Econ. Hist.*, Mar. 1987, 47(1), pp. 117-39. University of Massachusetts; Tufts University, Medford.

ones, S. R. H.—Technology, Transaction Costs, and the Transition to Factory Production in the British Silk Industry, 1700-1870  
Scholars still disagree about why nineteenth-century Britain adopted the factory system. Traditional historians emphasize the scale requirements of new technology; radical economists stress the possibilities that factory production held for worker exploitation; other economists and economic historians argue that the factory system was preferred because of its superior transaction-cost properties. This paper tests these competing hypotheses by examining the technological and organizational developments in the British silk industry. It concludes that in this industry, technological factors were primarily responsible for the adoption of the factory system. *J. Econ. Hist.*, Mar. 1987, 47(1), pp. 71-96. University of Auckland, New Zealand.

teal, Larry—The Integration and Efficiency of the London and Amsterdam Stock Markets in the Eighteenth Century  
This article explores the operation of the international capital market between Amsterdam and London in the early eighteenth century and concludes that both markets were efficient and well integrated from 1723 on. *J. Econ. Hist.*, Mar. 1987, 47(1), pp. 97-115. University of Illinois, Urbana.

ice, Jacob M. and Clemens, Paul G. E.—A Revolution of Scale in Overseas Trade: British Firms in the Chesapeake Trade, 1675-1775

In seventeenth-century England the relatively open trades to America attracted ventures by hundreds of small merchants and shopkeepers. This ease of entry was checked after 1785 by very high customs duties on tobacco and intense regulation. Between 1685 and 1775 the number of firms in that trade was radically reduced and the size of the average firm increased ten to thirtyfold. Comparable if less extreme trends can be detected in the sugar, slave, and Levant trades. Insurance enabled large firms to use shipping more efficiently. The increased availability of credit also benefited larger and more secure firms. *J. Econ. Hist.*, Mar. 1987, 47(1), pp. 1-43. University of Michigan; Rutgers University.

#### 050 ECONOMIC SYSTEMS

##### 053 Comparative Economic Systems

Stollar, Andrew J. and Thompson, G. Rodney—Sectoral Employment Shares: A Comparative Systems Context

This paper presents estimation results for a reduced-form equation that is formulated to explain variation in relative sectoral employment shares of agriculture, industry, and services between market and socialist countries. Covariance analysis is employed to test for parameter constancy between the types of economic systems and over time. The results indicate that while the same variables influence sectoral employment shares in both types of economic systems, the parameter coefficients of the reduced-form equations vary between market and socialist economies, and intertemporally. Additionally, estimates of the gaps between "normal" and actual shares are presented for socialist countries for all three sectors. *J. Compar. Econ.*, Mar. 1987, 11(1), pp. 62-80. Bentley College, Waltham, Massachusetts; Virginia Polytechnic Institute and State University.

#### 100 Economic Growth; Development; Planning; Fluctuations

##### 110 ECONOMIC GROWTH; DEVELOPMENT; AND PLANNING THEORY AND POLICY

##### 111 Economic Growth Theory and Models

Chang, Fwu-Ranq and Malliaris, A. G.—Asymptotic Growth under Uncertainty: Existence and Uniqueness

This paper demonstrates, using the Reflection Principle, the existence and uniqueness of the solution to the classic Solow equation under continuous time uncertainty for the class of strictly concave production functions which are continuously differentiable on the nonnegative real numbers. This class contains all CES functions with elasticity of substitution less than unity. A steady-state distribution also exists for this class of production functions which have a bounded slope at the origin. A condition on the drift-variance ratio of the stochastic differential equation alone is found to be necessary for the existence of a steady state. *Rev. Econ. Stud.*, Jan. 1987, 54(1), pp. 169-74. Indiana University; Loyola University.

**Manning, Richard**—Optimal Human and Physical Capital Accumulation in a Fixed-Coefficients Economy

This paper shows the existence and nature of optimal policies of accumulation of physical and human capital for an economy with everywhere fixed coefficients. The long run is described by a "golden-rule," which generalizes earlier results on education and growth but which, unlike them, does not permit the separation of the education sector from the rest of the economy. The adjustment of prices and quantities of the assets to long-run equilibrium is not monotonic in general. *Australian Econ. Pap.*, Dec. 1985, 24(2), pp. 258-70. University of Canterbury, Christchurch, New Zealand.

**Nishimura, Osamu and Nakao, Takeo**—A Note on the Golden-Rule Condition in the Overlapping Generations Growth Model

This paper examines the existence problem of the stationary state that maximizes per capita utility in Samuelson-Diamond model of overlapping generations combined with the post-Keynesian model of capital growth. Since in a life-cycle consumption model the consumer's decision depends on capital intensity, the relation between consumer's utility and capital intensity is not as simple as in the post-Keynesian model of capital growth. In this paper the authors show that a unique and stable stationary state is a local minimum, if it satisfies the well-known Swan-Phelps golden-rule production relation. *Manchester Sch. Econ. Soc. Stud.*, Dec.

1986, 54(4), pp. 420-24. Doshisha University, Japan.

**Thirlwall, A. P.**—A General Model of Growth and Development on Kaldorian Lines

This paper develops a "longitudinal" model of economic development, which formally models the complementarity between "agricultural" growth and industrial growth in the early stages of development in a closed economy, and stresses the importance of export growth in the later stages in the open economy as the main source of autonomous demand for industrial output. The importance of an equilibrium terms of trade between industry and agriculture in the closed economy model is clearly brought out, as well as the consequences of disequilibrium. *Oxford Econ. Pap.*, July 1986, 38(2), pp. 199-219. University of Kent.

**112 Economic Development Models and Theories**  
**Ghosh, Dipak**—Fix Price-Flex Price in Development Economics

In this paper, an attempt has been made to examine the link between inflation and unemployment in a developing country. An expansion of employment opportunities in these economies results in an increase in the demand for foodgrains. Prices of foodgrains being demand determined (flex price), this can cause the wage cost to increase, via an increase in the cost of living. Prices of most industrial goods being determined by cost of production (fix price), an increase in the wage cost causes prices of industrial goods to increase, thus giving rise to inflationary pressure for the economy as a whole. *Australian Econ. Pap.*, June 1986, 24(46), pp. 122-27. University of Stirling, Scotland.

**Heady, Christopher**—Designing Taxes with Migration

This paper analyzes the design of optimal taxes in less developed countries that suffer from excess rural-urban migration and reports results from a numerical model. These results illustrate the importance of both restrictions on the government's tax powers and the nature of the migration process in determining the optimal pattern of taxation. They also demonstrate that, under a very wide variety of circumstances, the existence of a fixed wage in the

urban area makes wage subsidies desirable even if they have to be financed by taxes on the poorest sections of society. *Econ. J., Supp.* 1987, 97, pp. 87-98. University College, London.

van der Willigen, Tessa A.—Cash Crop Production and the Balance of Trade in a Less Developed Economy: A Model of Temporary Equilibrium with Rationing

This paper investigates a model of temporary equilibrium with rationing for a less developed economy (e.g., Tanzania) suffering balance-of-payments problems as a result of declining cash crop production. The model consists of an agricultural sector producing cash and subsistence crops, an industrial sector, and a foreign trade sector. It shows that declining cash crop production may be due primarily to rationing of industrial goods and that increasing the producer price of the cash crop—whether relative to the subsistence crop or the general price level—may have perverse effects. *Oxford Econ. Pap.*, Nov. 1986, 38(3), pp. 424-42. Wolfson College, Oxford.

### 13 Economic Planning Theory and Policy

Dugger, William M.—Democratic Economic Planning and Worker Ownership

Increased worker participation in decision making, perhaps in the form of worker ownership, would insure that the economic planning urged by institutional economists would remain democratic. And since not even the most beautiful of worker cooperatives will naturally coordinate its activities with the requirements of other cooperatives, even a system based on worker ownership needs national planning. Grassroots worker participation and democratic economic planning make the institutionalism of Thorstein Veblen's modern followers a very different system than the corporatism of the conservative thinkers who follow Oliver E. Williamson. *J. Econ. Issues*, Mar. 1987, 21(1), pp. 87-99. DePaul University.

### 14 Economics of War, Defense, and Disarmament

Dypher, James M.—Military Spending, Technical Change and Economic Growth: A Disguised Form Of Industrial Policy?

The effect of military spending on the macroeconomy is too limited and inconsistent to support the idea that it functions as a sub rosa industrial policy. Military spending does not seem to crowd out civilian research and development, nor is it found to be a source of the productivity crisis. Military spending has been strongly associated with basic innovations in the postwar period. Currently the military is developing its manufacturing technology program designed to create the "factory of the future" and foster numerous innovations. The United States continues to rely upon the military to revitalize the forces of production. *J. Econ. Issues*, Mar. 1987, 21(1), pp. 33-59. California State University, Fresno.

Murdoch, James C. and Sandler, Todd—The Political Economy of Scandinavian Neutrality

The article examines whether three of the neutral nations of Europe (Sweden, Switzerland and Finland) have adhered to their choice of armed neutrality by being self-reliant on their own defenses. Using a joint product model, the authors specify a reduced-form equation for a nation's demand for military expenditures. Empirical estimates of these demands suggest that Sweden free rode on NATO after institution of the doctrine of flexible response; however, the other two neutral nations have been self-reliant throughout the period 1957-82. With pooled data, cross-equation restrictions highlight the essential differences between NATO and nonaligned Scandinavian countries. *Scand. J. Econ.*, 1986, pp. 88(4), 583-603. Auburn University; Iowa State University.

### 120 COUNTRY STUDIES

#### 124 Economic Studies of Centrally Planned Economies

Urata, Shujiro—Sources of Economic Growth and Structural Change in China: 1956-1981

This paper decomposes the growth of output in the People's Republic of China from 1956 to 1981 into changes in consumption and investment demand, intermediate input use, and foreign trade. The distribution between consumption and investment fluctuates in response to economic policies, while foreign trade dependence has grown over the sample period. Intermediate input consumption, calculated by

means of an input-output table, increased after 1965. A comparison with the experience of similar countries is also presented. *J. Compar. Econ.*, Mar. 1987, 11(1), pp. 96-115. Waseda University, Tokyo.

**130 ECONOMIC FLUCTUATIONS; FORECASTING; STABILIZATION; AND INFLATION**

**131 Economic Fluctuations**

Layton, Allan P.—A Causality Analysis of Australia's Growth Cycle and the Composite Index of Leading Indicators

The paper extends recent turning point analyses into the relationship between Australia's leading and coincident indexes of economic indicators. An empirically specified dynamic regression model linking the two measures of activity is used to test for the existence of Granger causality (1969, 1980). The specification procedure followed is that of L. Haugh and G. E. P. Box (1977). The analysis supports the existence of unidirectional causality from the leading to the coincident index. The lag involved was found to be five months. These findings provide further, more exhaustive evidence that the constructed index of leading indicators systematically anticipates future fluctuations in aggregate Australian economic activity. *Australian Econ. Pap.*, June 1986, 25(46), pp. 57-66. Macquarie University, Sydney.

**132 Forecasting: Econometric Models**

Edison, Hali J.—The U.K. Sector of the Federal Reserve's Multicountry Model: The Effects of Monetary and Fiscal Policies

The purpose of this paper is to describe and to analyze in some detail the U.K. sector of the Federal Reserve's Multicountry Model (MCM). The analysis focuses on the effects of shifts in U.K. monetary and fiscal policies at three levels: (1) within the unlinked U.K. sector, (2) within the linked MCM framework, and (3) within the linked MCM under the assumption that U.K. policy shifts are synchronized with those in the MCM other countries. The contrast between linked and unlinked simulation illustrates the importance of international feedback effects. *Manchester Sch. Econ. Soc. Stud.*, Dec. 1986, 54(4), pp. 403-19. Board of Governors of the Federal Reserve System.

Hall, Stephen G.; Henry, S. G. B. and W. Lewis, Simon—Manufacturing Stocks Forward-Looking Expectations in the U

This paper derives a model of the stocks price based on optimal behavior by the firm when facing adjustment costs with forward-looking expectations formation. Estimates of the model are reported for manufacturing, using three alternative expectations mechanisms for determining expected sales: time series; published forecasts (derived from National Institute published forecasts); and rational expectations. The latter uses a submodel dependent on weakly exogenous variables. Single equation and whole model comparisons are made of the stocks equation estimated with forward expectations versus a traditional backward-looking model. These favor the forward-looking model. *Economica*, Nov. 1986, 53(212), pp. 447-65. National Institute of Economic and Social Research, London.

Portes, Richard, et al.—Macroeconomic Planning and Disequilibrium: Estimates for Poland, 1955-1980

The authors specify and estimate a four-equation disequilibrium model of the consumption goods market in a centrally planned economy. This work is based on previous papers of R. Portes and D. Winter (1977) and W. Charemza and R. Quandt (1982). The model contains a household demand equation, a planners' supply equation, a "min" condition and plan adjustment equation through which plan formation becomes endogenous. The paper uses a unique new data set of time series for plans for the major macroeconomic variables in Poland. The overall framework is applicable to any large organization which plans economic variables. Coauthors are Richard E. Quandt, David Winter, and Stephen Yeo. *Econometrica*, Jan. 1987, 55(1), pp. 19-41. Birkbeck College and CEPR, London.

Siebrand, Jan C. and Swank, Job—An Evaluation of the Morkmon Model

MORKMON, De Nederlandsche Bank's new quarterly model of the Dutch economy, fits in the last generation of macroeconomic models. Based on an integrated set of national and financial accounts, it combines demand, supply and financial conditions. Distinct features are

in detailed financial sector, and endogenous exchange-rate determination. The specification reflects the model builders inclination to give a great weight to empirical evidence. The model's forecasting performance is quite satisfactory, but not all simulations yield plausible results. In particular the interaction between the real and the financial sector could benefit from further research, for which MORKMON provides an excellent bridgehead. *De Economist*, 1986, 134(3), pp. 289-300. Erasmus University.

**Wren-Lewis, Simon—Introducing Exchange-Rate Equations into a World Econometric Model**

The National Institute of Economic and Social Research's world economic forecasts are for the first time produced with the aid of a large quarterly econometric model. The model is based on the World Economic Prospects (WEP) model which has been operated and developed by economists in HM Treasury for more than a decade. However, exchange rates in WEP are exogenous, and this article discusses the estimation of an exchange-rate system for the model and its implications in terms of overall model properties. *Nat. Inst. Econ. Rev.*, Feb. 1987, (119), pp. 57-69. National Institute of Economic and Social Research, London.

**33 General Outlook and Stabilization Theories and Policies**

**Britton, Andrew J. C.; Eastwood, Fiona and Major, Robin L.—Macroeconomic Policy in Italy and Britain**

This is the third and last in a series of articles comparing macroeconomic policy in the United Kingdom and in its largest European neighbors. The article begins by outlining in chronological order the successive stages of economic policy in Italy since the postwar period. This is followed by a section on the operation of fiscal and monetary policy. A brief account is then given of the structure of the Italian economy, concentrating on the labor market and trade, and the article ends with a discussion of the lessons one might draw from Italian experience. *Nat. Inst. Econ. Rev.*, Nov. 1986, (118), pp. 38-52. National Institute of Economic and Social Research, London.

**Downe, Edward A.—Minsky's Model of Financial Fragility: A Suggested Addition**

In Hyman Minsky's theoretical framework, capitalist economies exhibit financial instability. Keynesian policies stem a crisis by bolstering demand and improving balance sheets, but the cost is accelerating inflation. An inflation solution lies in restricting business power to mark up prices and/or workers demand for higher wages. Usually a political solution with an anti-labor bias is employed, i.e., disciplining workers through recessions which create job loss. The author's addition combines Minsky's model with Samuel Bowles's Marxist model to suggest a "new Phillips Curve" where "power" plays a key role: namely, inflation is reduced by increasing workers' perceived cost of job loss. *J. Post Keynesian Econ.*, Spring, 1987, 9(3), pp. 440-54. St. John's University.

**Frenkel, Jacob A.—International Interdependence and the Constraints on Macroeconomic Policies**

This paper analyzes the constraints that the openness of the economy imposes on the conduct of macroeconomic policy. The constraints are illustrated in the context of a variety of models highlighting the interactions among international capital mobility, the exchange-rate regime, and the severity of the constraints on the conduct and effectiveness of macroeconomic policy. The paper addresses the question of exchange-market intervention and the implications of the limited effectiveness of sterilized-intervention policies. The concluding section deals with policy implications concerning the roles of monetary and exchange-rate policies, protectionism, and reform of the international monetary system. *Weltwirtschaft. Arch.*, 1986, 122(4), pp. 615-46. University of Chicago.

**Hughes Hallett, A. J.—Autonomy and the Choice of Policy in Asymmetrically Dependent Economies: An Investigation of the Gains from International Policy Co-ordination**

This paper examines whether decentralized control of the world economy effectively limits our ability to steer individual economies. It is well known that noncooperative policies are Pareto inefficient; but there is, as yet, no empir-

ical evidence on the costs of uncoordinated policies or the potential gains and risks in cooperation. In contrast to recent theoretical work in the area, this paper uses an estimated multi-country model in a dynamic game framework to estimate those costs and benefits. Policy design depends crucially on the asymmetries between economies. Successful coordination depends on anticipation and on timing the fiscal and monetary policy impacts correctly. *Oxford Econ. Pap.*, Nov. 1986, 38(3), pp. 516-44. University of Newcastle.

### 134 Inflation and Deflation

**Burmeister, Edwin and Wall, Kent D.**—Unobserved Rational Expectations and the German Hyperinflation with Endogenous Money Supply

A Kalman filtering technique is employed to test the convergent expectation hypothesis in the great German hyperinflation when the money supply is endogenously determined. After converting the model structure to a state space form, the parameters are estimated via minimization of a Gaussian likelihood function. The result is then used in a filter-smoother combination to yield smoothed estimates of the state variable associated with the arbitrary constant of the rational expectations solution. Both parametric and nonparametric tests lead us to reject the null hypothesis of convergent expectations. *Int. Econ. Rev.*, Feb. 1987, 28(1), pp. 15-32. University of Virginia, Charlottesville; Naval Postgraduate School, Monterey, California.

**Christiano, Lawrence J.**—Cagan's Model of Hyperinflation under Rational Expectations

This paper studies P. Cagan's model of the German hyperinflation under the hypothesis that adaptive expectations are rational. It shows that inference about the key money demand elasticity parameter,  $\alpha$ , is very sensitive to the specification of the dynamic interaction of the unobserved money demand shock with prices and money. In particular, if T. J. Sargent's 1977 specification is modified, then his basic conclusions are overturned: identification of  $\alpha$  does not require prior knowledge about the covariance of unobserved shock terms; and data on the German hyperinflation imply a sharp, not

loose estimate of  $\alpha$ , which is of plausible magnitude. Finally, informal tests indicate that modifying Sargent's specification gives rise to improved model fit. *Int. Econ. Rev.*, Feb. 1987, 28(1), pp. 33-49. Federal Reserve Bank of Minneapolis.

**Dunson, Bruce H. and Jackson, Peter**—The Distributional Aspects of Inflation

This article examines the effect of inflation on the distribution of income. Although the results were inconclusive, it was found that inflation appeared to decrease the proportion of white families in the bottom of the income distribution. For blacks, however, there was no relationship between income inequality and price inflation. This article also examines the issue of whether the expenditures of some income groups were taxed more than others by inflation. The findings were that for whites inflation during the 1973-1979 period taxed the expenditures of the lower income groups more; for blacks, however, during this same period, inflation taxed the expenditures of all groups equally. *Quart. Rev. Econ. Bus.*, Winter 1986, 26(4), pp. 62-73. Prairie View A & M University, Texas; Atlanta University.

**Henry, Samuel G. B. and Karakitsos, Elias**—Inflation, Unemployment and Indirect Taxation

A cut in indirect tax reduces market prices, and lowers inflation temporarily while increasing real disposable income and employment. A small analytical macroeconomic model is developed to analyze the transmission of indirect tax changes incorporating two features of the National Institute econometric model: an inflation loss term in holding liquid assets, and real wage rigidity. Associated problems of internal and external financing of tax changes are further analyzed using multi-target and multi-instrument optimal control with the full econometric model. *Bull. Econ. Res.*, Jan. 1987, 39(1), pp. 29-47. National Institute of Economic and Social Research, London; Imperial College, London.

**Stockton, David J. and Glassman, James E.**—An Evaluation of the Forecast Performance of Alternative Models of Inflation

The forecast performances of three groups of models of the inflation process are evaluated in this paper: rational expectations models with instantaneous market clearing, monetarist models, and expectations-augmented Phillips curves. The dynamic simulations performed for the intervals between 1977 and 1984 are somewhat discouraging for all three theories. The variation in forecasting performance within model groups often exceeded the variation in performance across model groups. Nevertheless, the Phillips curve formulation rarely performed worse than the other two models, and in the 1981 to 1984 period it performed substantially better than the alternative models of inflation. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 108-17. Board of Governors of the Federal Reserve System.

## 200 Quantitative Economic Methods and Data

### 210 ECONOMETRIC, STATISTICAL, AND MATHEMATICAL METHODS AND MODELS

#### 211 Econometric and Statistical Methods and Models

Cuddington, John T. and Winters, L. Alan—  
The Beveridge-Nelson Decomposition of Economic Time Series; A Quick Computational Method

This note describes a much simpler computational method for carrying out the Steven Beveridge and Charles Nelson (1981) decomposition of economic time series into permanent and cyclical components. *J. Monet. Econ.*, Jan. 1987, 19(1), pp. 125-27. The World Bank and Georgetown University; University of College of North Wales.

Engle, Robert F. and Granger, Clive W. J.—  
Co-integration and Error Correction: Representation, Estimation and Testing

The relationship between cointegration and error correction models, first suggested by Granger, is here extended and used to develop estimation procedures, tests, and empirical examples. A vector of time series is said to be cointegrated with cointegrating vector  $\alpha$  if each element is stationary only after differencing while linear combinations  $\alpha'x_t$  are themselves stationary. A representation theorem connects

the moving average, autoregressive, and error correction representations for cointegrated systems. A simple but asymptotically efficient two-step estimator is proposed and applied. Tests for cointegration are suggested and examined by Monte Carlo simulation. A series of examples are presented. *Econometrica*, Mar. 1987, 55(2), pp. 251-76. University of California, San Diego.

Gallant, A. Ronald and Nychka, Douglas W.—  
Semi-nonparametric Maximum Likelihood Estimation

Often maximum likelihood is the method of choice for fitting an econometric model to data but cannot be used because the correct specification of (multivariate) density that defines the likelihood is unknown. In this situation, simply put the density equal to a Hermite series and apply standard finite dimensional maximum likelihood methods. Model parameters and nearly all aspects of the unknown density itself will be estimated consistently provided that the length of the series increases with sample size. The rule for increasing series length can be data dependent. The method is applied to nonlinear regression with sample selection. *Econometrica*, Mar. 1987, 55(2), pp. 363-90. Institute of Statistics, North Carolina State University.

Godfrey, Leslie G.—Discriminating between Autocorrelation and Misspecification in Regression Analysis: An Alternative Test Strategy

A strategy for discriminating between autocorrelation and misspecification is proposed as an alternative to Jerry G. Thursby's (1981) procedure. An ordered sequence of hypotheses is formulated and tested using an autocorrelation robust check for misspecification and asymptotic tests of the form of the error autocorrelation model. A discussion of responses to the various outcomes of the tests is provided, along with comments on the implementation of the procedures. The strategy is only appropriate for regression equations with exogenous regressors, but suggestions are made for analyzing models with lagged dependent variables. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 128-34. University of York.

**Manski, Charles F.**—Semiparametric Analysis of Random Effects Linear Models from Binary Panel Data

Andersen (1970) considered the problem of inference on random effects linear models from binary response panel data, and showed that inference is possible if the disturbances for each panel member are known to be white noise with the logistic distribution. The present paper shows that inference remains possible if the disturbances are known only to be time-stationary. A conditional version of the maximum score estimator consistently estimates the parameters up to scale. *Econometrica*, Mar. 1987, 55(2), pp. 357–62. University of Wisconsin.

**McCarthy, Michael D.**—Exact Finite Sample Test Statistics for Restricted Reduced Forms: A Generalization of "Student's" Result

Test statistics and estimators for reduced-form coefficients involved in overidentifying exclusion restrictions are proposed. The test statistics, under the null hypothesis, do not depend on unknown parameters. One of the test statistics is exactly a Student "t" under the null hypothesis. A two equation (supply/demand) framework is used, but generalizations are suggested. *Intnl. Econ. Rev.*, Feb. 1987, 28(1), pp. 259–69. University of Pennsylvania and Temple University.

**Phillips, P. C. B.**—Time Series Regression with a Unit Root

This paper studies the random walk in a general time series setting that allows for weakly dependent and heterogeneously distributed innovations. It is shown that simple least squares regression consistently estimates a unit root under very general conditions in spite of the presence of autocorrelated errors. The limiting distribution of the standardized estimator and the associated regression *t* statistic are found using functional central limit theory. New tests of the random walk hypothesis are developed which permit a wide class of dependent and heterogeneous innovation sequences. A new limiting distribution theory is constructed based on the concept of continuous data recording. This theory, together with an asymptotic expansion that is developed in the paper for the unit root case,

explain many of the interesting experimental results recently reported in Evans and Savin (1981, 1984). *Econometrica*, Mar 1987, 55(2), pp. 277–301. Cowles Foundation for Research in Economics, Yale University.

**Small, Kenneth A.**—A Discrete Choice Model for Ordered Alternatives

A generalization of the multinomial logit (MNL) model is developed for cases where discrete alternatives are ordered, by allowing stochastic correlation among alternatives in close proximity. The model belongs to the Generalized Extreme Value class and is therefore consistent with random utility maximization. An extension can handle cases where observations have been selected from a truncated choice set. A two-stage procedure using MNL computer software provides a specification test for MNL against the proposed model. Two empirical applications are briefly described. *Econometrica*, Mar. 1987, 55(2), pp. 409–24. University of California, Irvine.

**Thurman, Walter N.**—Endogeneity Testing in a Supply and Demand Framework

The powers of Wu–Hausman endogeneity tests are related to the normalization decision in estimating demand equations. Power is not invariant to the choice between quantity and price as the dependent variable. A theoretical result due to Nakamura and Nakamura (1984) is used to explore the dependence of power on parameters of the supply and demand system. The theoretical result is corroborated with a Monte Carlo experiment. The power results are used to analyze the U.S. demand for poultry meat wherein price, but not quantity, is found to be predetermined. *Rev. Econ. Statist.*, Nov. 1986, 68(4), pp. 638–46. North Carolina State University.

## 212 Construction, Analysis, and Use of Econometric Models

**Anderson, Richard G. and Thursby, Jerry G.**—Confidence Intervals for Elasticity Estimators in Translog Models

This paper examines the distribution functions of elasticity estimators in translog demand models. The authors consider the normal and ratio-of-normals distributions and present confi-

dence intervals for the elasticity estimators. The results suggest that only elasticity estimators based on the means of the actual cost shares are likely to follow either the normal or ratio-of-normals distribution function. Examination of three published empirical studies demonstrates that inferences regarding the values of elasticities cannot be made from point estimates alone and suggests a trade-off between the level of aggregation and the width of confidence intervals for the elasticity estimators. *Rev. Econ. Statist.*, Nov. 1986, 68(4), pp. 647-56. The Ohio State University.

**Björklund, Anders and Moffitt, Robert**—The Estimation of Wage Gains and Welfare Gains in Self-Selection Models

The authors modify the basic self-selection model for the effects of education, training, unions, and other activities on wages, by including "heterogeneity of rewards" to the activity—i.e., differences across individuals in the rate of return to the activity. The authors show that such heterogeneity creates a new form of selection bias. They provide tests for its presence and draw out its implications for the wage and welfare gains to the activity. An empirical application provides strong support for such heterogeneity in one particular training program. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 42-49. Industrial Institute for Economic Social Research and the Institute for Social Research, Stockholm; Brown University.

**Diewert, Walter E. and Wales, Terence J.**—Flexible Functional Forms and Global Curvature Conditions

Two methods are developed for imposing curvature conditions globally in the estimation of cost functions. The first adopts a procedure due to Lau, for imposing the conditions locally, to a generalization of a functional form proposed by McFadden. With this functional form, imposing the appropriate conditions at one data point imposes the conditions globally. The second method adopts a technique used by Diewert, McFadden, and Barnett, which is based on the fact that a nonnegative sum of concave functions is concave. The suggested techniques are illustrated using the U.S. Manufacturing data utilized by E. R. Berndt and M. S. Khaled

(1979). *Econometrica*, Jan. 1987, 55(1), pp. 43-68. University of British Columbia.

**Hensher, David A.**—Sequential and Full Information Maximum Likelihood Estimation of a Nested Logit Model

Sequential estimation of a nested logit model is in general not an empirically desirable procedure, either as an alternative to full information maximum likelihood (FIML) estimation or as a source of parameter starting values for FIML estimation. Empirical studies which use varying choice sets across the sampled population create ambiguity in the link between sequential and simultaneously estimated nested logit models. FIML estimation is now a computationally feasible strategy as illustrated herein. *Rev. Econ. Statist.*, Nov. 1986, 68(4), pp. 657-67. Macquarie University.

**Hughes Hallett, Andrew J.**—Forecasting and Policy Evaluation in Economies with Rational Expectations: The Discrete Time Case

Several techniques have been proposed for solving dynamic rational expectations models. This paper examines a simple method for discrete time applications. That solution is then used to derive and compute optimal policy selections (incorporating "noncausal" effects) which are also time consistent when sequentially reoptimized. Those decisions are shown to contain an optimal open loop component plus an innovations dependent correction mechanism. A numerical example is used to verify those properties. *Bull. Econ. Res.*, Jan. 1987, 39(1), pp. 49-70. University of Newcastle.

**de Koning, Jaap**—The Expected Industrial Production Volume Estimated with the Help of Data from the Business-Cycle Test

Expectations play a crucial role in economics. The testing of hypotheses about the formation of expectations is hampered by the lack of data. In this article the author measures expectations in an independent way, using data from the Business Cycle Test. The data refer to the output of the Dutch manufacturing industry. The results indicate that both error-correcting and extrapolative mechanisms are relevant in the process of expectation formation. *De Economist*, 1986, 134(4), pp. 479-91. Netherlands Economic Institute, Rotterdam.

**Marsden, James R. and Pingry, David E.**—Engineering Production Functions and the Testing of Quantitative Economic Hypotheses

This note addresses two issues concerning the empirical role of engineering production functions: (1) the possibility of deriving typical economic production function forms from underlying engineering relationships, and (2) the appropriate role of engineering production formulations for testing quantitative economic hypotheses. It is argued that much of the importance of engineering production analysis lies in its ability to serve as a basis for nonempirical tests of quantitative economic hypotheses concerning measures such as marginal products and elasticities. *Economica*, Nov. 1986, 53(212), pp. 533–34. University of Arizona and University of Kentucky; University of Arizona.

**Orazem, Peter and Miranowski, John**—An Indirect Test for the Specification of Expectation Regimes

This paper develops an empirical strategy for testing competing hypotheses of expectation regimes when direct measures of expectations are unavailable. The procedure takes as given an assumed structural relationship between expected values of exogenous variables and a given decision variable. By imposing different expectation regimes on this model, the authors obtain an artificial nesting of the hypothesized regimes which allows us to test whether any specification dominates. This methodology is extended to multiple equation applications with any number of hypothesized expectation regimes. The tests are illustrated using a model of the response of county-level farm acreage allocation to expected commodity prices. *Rev. Econ. Statist.*, Nov. 1986, 68(4), pp. 603–09. Iowa State University; U.S. Department of Agriculture.

**Pollak, Robert A. and Wales, Terence J.**—Specification and Estimation of Nonseparable Two-Stage Technologies: The Leontief CES and the Cobb–Douglas CES

A two-stage technology is a sequential production process that first uses primary inputs

to produce intermediate inputs and then uses the intermediate inputs to produce final output. In this paper the authors show that two-stage technologies provide a general procedure for combining production functions or cost functions to obtain new specifications suitable for empirical production analysis. They investigate two new cost functions for which the input demand systems satisfy global regularity conditions in a wide range of nondegenerate cases. Using six data sets, the authors estimate these two input demand systems, both with and without imposing global regularity conditions, and find that one of them performs well. *J. Polit. Econ.*, Apr. 1987, 95(2), pp. 311–33. University of Pennsylvania and University of Washington; University of British Columbia.

**Smith, V. Kerry**—Another View of the State of Engineering Production Functions

This paper suggests that recent econometric analyses of pseudo data should be viewed as extending H. Chenery's framework for engineering production functions. *Economica*, Nov. 1986, 53(212), pp. 529–32. Vanderbilt University.

**Veall, Michael R.**—Bootstrapping the Probability Distribution of Peak Electricity Demand

For effective capacity planning, an electric utility requires an estimate of the probability distribution of future maximum demand, rather than simply a point prediction of expected peak. This paper proposes a method of obtaining this using the bootstrapping technique of B. Efron (1979) and this is applied to the peak demand of an actual utility, Ontario Hydro. While the technique is constructed from the standard procedure of forecasting a future variable using regression coefficients and known values for the right-hand side variables, it is modified to allow for uncertainty in these independent variable forecasts as well. *Int. Econ. Rev.*, Feb. 1987, 28(1), pp. 203–12. McMaster University.

## 215 Experimental Economic Methods

**Alger, Dan**—Laboratory Tests of Equilibrium Predictions with Disequilibrium Data

The author examines a common practice used within previous studies of laboratory markets,

testing equilibrium models using some data from markets that have not reached an equilibrium. The author examines the effect of this practice when it is applied to some laboratory markets where an appreciable number of them eventually satisfied an operational definition of an equilibrium. Data suggest that significantly different equilibrium test results would be obtained when using all data available in market periods analyzed in previous studies rather than using only equilibrium data. *Rev. Econ. Stud.*, Jan. 1987, 54(1), pp. 105-45. Federal Trade Commission.

**Williams, Arlington W.—The Formation of Price Forecasts in Experimental Markets**

This study utilizes laboratory experimental methods to evaluate the empirical validity of: (1) "Muthian" rational expectations assumptions, (2) an adaptive expectations model, and (3) an extrapolative expectations model. Over 500 price forecasts from 146 participants in twelve experimental double-auction markets with a cash reward structure are analyzed. The forecasting objective is the mean price over a sequence of trading periods governed by stationary market parameters. The price forecasts are found to be inconsistent with strict Muthian rational expectations and the extrapolative model is not supported by the data. However, the forecasts generally support the adaptive expectations model. *J. Money, Credit, Banking*, Feb. 1987, 19(1), pp. 1-18. Indiana University.

**220 ECONOMIC AND SOCIAL STATISTICAL DATA AND ANALYSIS**

**221 National Income Accounting**

**Aszear, Edward P. and Michael, Robert T.—**Estimating the Personal Distribution of Income with Adjustment for Within-Family Variation

The 1970 and 1979 Current Population Surveys are used to compute the personal distribution of income. The major innovation in this paper is that all individuals in the household are not treated identically. In particular, children receive a different proportion of income than do adults. That proportion is estimated. Its variations with respect to household characteristics are discussed, and a final distribution of personal income is computed. That distribu-

tion has considerably fatter tails than does the one normally used. *J. Lab. Econ.*, Pt. 2, July 1986, 4(3), pp. S216-39. University of Chicago and National Opinion Research Centre.

**Nolan, Brian—Unemployment and the Size Distribution of Income**

The impact of changes in the level of unemployment on the U.K. size distribution of annual income is examined using cross-section data. Increased unemployment is shown to have a discernible regressive effect. However, reductions in shares were not highly concentrated at the very bottom of the distribution. Many individuals affected by unemployment during the year are in households/families, not at the bottom of the distribution, particularly because of the presence of other working members. *Economica*, Nov. 1986, 53(212), pp. 421-45. Central Bank of Ireland.

**Schneider, Friedrich—Estimating the Size of the Danish Shadow Economy Using the Currency Demand Approach: An Attempt**

The currency demand approach provides some insight into the size and development of the shadow economy in Denmark. Currency demand is statistically affected by tax rates. The difference in currency demand is calculated by comparing the actual tax burden over time to the lowest tax burden in the period 1952-82. The shadow economy grew steadily to 10 percent (of GNP) in 1977 and then fluctuated between 7 and 10 percent (of GNP) for the period 1978-82. The calculated size fits nicely with the results obtained using the same method for Norway, Sweden, and West Germany. *Scand. J. Econ.*, 1986, 88(4), pp. 643-68. University of Linz, Austria.

**Shackett, Joyce R. and Slottje, D. J.—Labor Supply Decisions, Human Capital Attributes, and Inequality in the Size Distribution of Earnings in the U.S., 1952-81**

This paper analyzes the impact of human capital, labor force variables, and macroeconomic growth measures on inequality in U.S. size distribution of earnings. Its technique utilizes a beta distribution of the second kind to approximate the distribution of earnings. It derives a measure of inequality that depends solely on

the parameters of the beta distribution and that links human capital, labor force, and macroeconomic variables to changes in the parameters of the beta distribution. The authors then relate the changing parameters of the beta distribution of changes in the degree of inequality in the marginal distribution of earnings. *J. Human Res.*, Winter 1987, 22(1), pp. 82-100. University of Texas, Arlington; Southern Methodist University.

**Tice, Helen Stone and Moczar, Louis J.**—Foreign Transactions in the National Income and Product Accounts: An Overview

This article presents the conceptual basis and framework of foreign transactions in the U.S. national income and product accounts (NIPA's), describes the presentation of the estimates, and summarizes the sources and methods used to prepare them (including the price indexes used to deflate exports and imports). This article includes a description of the conceptual and statistical relationship between the foreign transactions in the NIPA's and the balance of payment accounts. *Surv. Curr. Bus.*, Nov. 1986, 66(11), pp. 23-36. U.S. Department of Commerce, Bureau of Economic Analysis.

## 223 Financial Accounts

**Barbera, Anthony J.**—Inflation, Tax Rules and Investment: Some Additional Evidence

Martin Feldstein has provided evidence that the cost of capital and the rate of return on capital have a statistically significant effect on nonresidential fixed investment. Feldstein also showed that inflation was the primary cause for the decline in aggregate investment during the 1970s because of its effect on these price variables. In this paper, the author reexamines Feldstein's empirical evidence with his data by using a pair of specification tests to compare his equations with alternatives that do not contain any price variables. Both tests reject Feldstein's equations and fail to reject the alternatives. *J. Post Keynesian Econ.*, Spring 1987, 9(3), pp. 315-26. Data Resources, Washington, D.C.

## 224 National Wealth and Balance Sheets

**Kokoski, Mary F.**—Indices of Household Welfare and the Value of Leisure Time

Leisure-inclusive welfare indices, such as the real wage index, have been previously investigated only with aggregate data. Using micro data, however, these indices show the effects of increasing labor market employment of household members. Real wage, expenditure, and nonlabor income indices are compared across six types of husband/wife households. These indices are also compared to ad hoc real wage and leisure-exclusive index measures. Doubt is cast on past results based upon aggregate data. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 83-89. U.S. Bureau of Labor Statistics.

**226 Productivity and Growth: Theory and Data**  
**Baumol, William J.**—Productivity Growth, Convergence, and Welfare: What the Long-run Data Show

Maddison's 1870-1979 data are analyzed, showing the historically unprecedented growth in productivity, GDP per capita and exports and the remarkable convergence of productivities of industrialized market economies, with convergence apparently shared by planned economies but not less developed countries. Productivity lag's relation to "deindustrialization," unemployment and balance of payments is examined. The data confirm that U.S. productivity growth fell behind its extraordinary postwar peak but probably not below its long term level. It is also shown that more rapid productivity growth of other countries may only be a normal concomitant of convergence. *Amer. Econ. Rev.*, Dec. 1986, 76(5), pp. 1072-85. Princeton University and New York University.

## 300 Domestic Monetary and Fiscal Theory and Institutions

**310 DOMESTIC MONETARY AND FINANCIAL THEORY AND INSTITUTIONS**

**311 Domestic Monetary and Financial Theory and Policy**

**Andersen, T. M.**—Pre-set Prices, Differential Information and Monetary Policy

This paper proves the case for an active stabilization policy by analyzing an economy exposed to nominal shocks, where prices are pre-set by firms possessing differential information. Price decisions are uncoordinated in that when each firm sets its price it is imperfectly informed

about prices set by other firms. The role of a systematic monetary policy, as a means to overcome the implications of differential information for the allocation of economic resources, is analyzed. Alternatively, a private indexation scheme is also analyzed and compared to monetary policy, which can eliminate completely the implications of differential information, whereas an indexation scheme can do so only partially. *Oxford Econ. Pap.*, Nov. 1986, 38(3), pp. 456-80. Aarhus University.

**Barsky, Robert B.**—The Fisher Hypothesis and the Forecastability and Persistence of Inflation

For the period 1860 to 1939, the simple correlation of the U.S. commercial paper rate with the contemporaneous inflation rate is  $-0.17$ . The corresponding correlation for the period 1950 to 1979 is  $0.71$ . This paper attributes this apparent change in the Fisher relation to differences in the stochastic process of inflation, rather than a change in any structural relationship between interest rates and expected inflation. Contrary to recent claims in the literature, there is little evidence of inflation nonneutrality in data from the pre-World War I period. *J. Monet. Econ.*, Jan. 1987, 19(1), pp. 3-24. University of Michigan and National Bureau of Economic Research.

**Bohara, Alok K.; Bradley, Michael G. and McNown, Robert F.**—New Evidence on Targets for Monetary Policy

A multiple autoregressive moving average model is developed and employed in the analysis of the interrelations between policy, target, and goal variables. A time-series model that simultaneously examines the control problem and the target-goal relationship yields results different from those reported by researchers who examine these issues separately. The forecast error variances are decomposed to yield additional insights into the relationships among the variables. *Southern Econ. J.*, Jan. 1987, 53(3), pp. 591-604. University of Colorado.

**Campbell, John Y.**—Money Announcements, the Demand for Bank Reserves, and the Behavior of the Federal Funds Rate within the Statement Week

The effect of money stock announcements on the federal funds rate has been attributed informally to the information conveyed by the announcements about aggregate reserve demand. This "Aggregate Information Hypothesis" explains the effect without reference to Federal Reserve intervention in the funds market. In this paper, the author provides a formal model of the Aggregate Information Hypothesis under lagged reserve accounting. The model relies on imperfect information in the funds market and on imperfect bank arbitrage of reserve demand between days of the week. Some stylized facts are presented about funds rate behavior in the period 1960-83. *J. Money, Credit, Banking*, Feb. 1987, 19(1), pp. 56-67. Princeton University.

**Canto, Victor A.; Nickelsburg, Gerald and Rizos, Paul**—The Effect of Fiscal Policy on the Short-run Relation between Nominal Interest Rates and Inflation

This paper presents a simple empirical model of the relation between the inflation rate and the nominal interest rate. The authors show that previous results found in the literature may be attributed to specification error and that there are natural explanations for the observed signs of previous Fisher equation estimates. Fiscal policy shocks may generate short-run negative correlations between changes in inflation and changes in the nominal interest rates. These results illustrate the difficulty in discussing the relation between inflation and nominal interest rates without conditioning the analysis with specific assumptions on the course of the economy. *Econ. Inquiry*, Jan. 1987, 25(1), pp. 27-42. A. B. Laffer and Associates, Lomita, California; University of Southern California, Los Angeles; University of Southern California, Los Angeles.

**Cothren, Richard**—Asymmetric Information and Optimal Bank Reserves

One traditional argument in favor of bank reserve requirements holds that since a bank and its depositors are asymmetrically informed as to the bank's reserve position and its portfolio, the bank will hold too few reserves and too risky a portfolio. This being the case, presumably a central banking authority is equipped

to impose and to monitor a minimal reserve requirement yielding a Pareto superior outcome. This paper analyzes this position in the context of a formal model and shows that at least for some parameters of the model there is such a case for a minimal reserve requirement. *J. Money, Credit, Banking*, Feb. 1987, 19(1), pp. 68-77. Virginia Polytechnic Institute and State University.

**Cover, James Peery and Keeler, James P.**—Estimating Money Demand in Log-First-Difference Form

This paper demonstrates that the *M1* and real GNP time series for the United States follow nonstationary stochastic processes. Stationarity is achieved by first-differencing natural logs. As a result estimating money demand in log-first-difference form is theoretically preferable to log-level form. Comparisons of log-first-difference estimates with log-level estimates support this conclusion. Log-first-difference estimates yield a faster speed of adjustment and support the nominal form of the partial-adjustment mechanism and real GNP, rather than real consumption, as a scale variable. *Southern Econ. J.*, Jan. 1987, 53(3), pp. 751-67. University of Alabama; Kenyon College.

**Cuthbertson, Keith and Taylor, Mark P.**—The Demand for Money: A Dynamic Rational Expectations Model

This paper presents and estimates a model of the demand for money which explicitly incorporates forward-looking behavior. A multiperiod, rational expectations, quadratic costs of adjustment problem is solved using the discrete time calculus of variations to yield a money demand equation which is both forward-looking and contains a lagged dependent variable, and nests partial adjustment and error correction alternatives. The equation is estimated jointly with a vector autoregression for the forcing variables, subject to cross-equation restrictions in an attempt to circumvent the R. E. Lucas (1976) critique, on U.K. data for narrow money, *M1*. The results are encouraging. *Econ. J.*, Supp. 1987, 97, pp. 65-76. University of Newcastle; Bank of England and University of Newcastle.

**Fethke, Gary and Policano, Andrew**—Monetary Policy and the Timing of Wage Negotiations

In a model of long-term labor contracts, the simultaneous determination of the pattern of contract negotiation and the pattern of monetary-policy intervention yields a Nash equilibrium in which agents allow a discretionary role for policy. The resulting pattern of negotiation depends on the stochastic nature of the system. When all disturbances are aggregate in nature, a synchronized pattern of negotiation is optimal regardless of the frequency of monetary-policy intervention. When both aggregate and relative disturbances affect the system, a pattern of bunched negotiations can result with the authority intervening at dates away from the negotiation dates. *J. Monet. Econ.*, Jan. 1987, 19(1), pp. 89-105. University of Iowa.

**Freeman, Scott**—Reserve Requirements and Optimal Seigniorage

This note presents a model of optimizing agents who chose to hold deposits at financial intermediaries, which are required to hold fractional reserves of fiat money. When the stock of fiat money is expanded, the reserve requirement functions as a tax on deposits. The combination of reserve requirements and inflation results in a lower steady-state utility than a direct tax on deposits. The optimal monetary policy when reserves are required is to minimize reserve requirements and inflate without limit the stock of fiat money. *J. Monet. Econ.*, Mar. 1987, 19(2), pp. 307-14. Boston College.

**Hamilton, James D.**—Monetary Factors in the Great Depression

This paper examines the role of monetary policy in the early stages of the Great Depression and considers the mechanism whereby this policy may have affected real activity. The author concludes that the depression was preceded by a dramatic shift towards a highly contractionary monetary policy. The economic impact of this policy seems unlikely to have come through the conventional Keynesian channels of a shortage of liquidity and high *ex ante* real interest rates, but instead may have operated through unanticipated deflation and, after 1930, through the disruption of financial

intermediation as a consequence of the banking panics. *J. Monet. Econ.*, Mar. 1987, 19(2), pp. 145-69. University of Virginia.

**Hein, Scott E.**—Monetary Announcements and Interest Rate Responses

This paper offers reasons why, under lagged reserve accounting system, unexpected monetary base announcements may have weak, insignificant effects on interest rates, while at the same time, unexpected money supply announcements have significant interest rate effects. The paper also argues that under a non-borrowed reserve targeting system (October 1979 to roughly October 1982), unexpected announcements in Federal Reserve discount window borrowing were likely viewed as containing important information to financial community. Surprise discount window borrowing announcements had significant effect on interest rates, prior to abandonment of non-borrowed reserve targeting procedure in late 1982. Since then, neither borrowing nor money supply surprises significantly effect interest rates. *Southern Econ. J.*, Jan. 1987, 53(3), pp. 615-26. Texas Tech University.

**Koenig, Evan F.**—The Short-run "Tobin Effect" in a Monetary Optimizing Model

In an economy in which households face a cash-in-advance constraint, the nominal interest rate acts like a tax on consumption. To the extent that investment is financed from current earnings and so escapes the interest rate tax, households will defer their consumption when the nominal interest rate is high. A short-run Tobin effect results: capital accumulates most rapidly when the interest rate is thought to be high relative to its past and future values. *Econ. Inquiry*, Jan. 1987, 25(1), pp. 43-53. University of Washington.

**Koskela, Erkki and Virén, Matti**—Endogenous Policy, Structural Shift, and Demand for Money

The paper revisits the demand for money equation, originally suggested by Goldfeld, by using the U.S. quarterly data over the period 1955I-1978IV. Results from different estimation methods and specification tests indicate

that the Goldfeld equation suffers from misspecification. Some contrary claims notwithstanding, this seems to result neither from inappropriate dynamic specification nor from conventional estimation in terms of autocorrelation adjustment. Instead, the assumptions of exogenous interest rates and structural stability have to be rejected. Specifying an interest rate reaction function helps to improve the performance of the Goldfeld demand for money function. *Weltwirtsch. Arch.*, 1986, 122(4), pp. 647-56. University of Helsinki; Bank of Finland, Helsinki.

**Milbourne, Ross D.**—Re-examining the Buffer-Stock Model of Money

This paper critically examines recent papers in the buffer stock or supply side disequilibrium models of money. The paper first investigates the assumptions at the microeconomic level and concludes that even with these assumptions, aggregate behavior does not necessarily follow buffer-stock models in which excess cash balances are held involuntarily. In a simple model with uncertain cash flows, it is shown that in the aggregate short-run involuntary cash holdings are negligible. If the buffer-stock story is applicable, it is to a broader definition of money than used in most empirical work. The second part of the paper examines empirical work and argues that the buffer-stock idea cannot be implemented using single equation techniques, and that when viewed appropriately, current empirical results refute the buffer-stock idea as it is currently modeled. *Econ. J.*, Supp. 1987, 97, pp. 130-42. Queen's University.

**Reichenstein, William**—The Impact of Money on Short-term Interest Rates

This study reviews empirical evidence from four research methods related to the impact of money on short-term nominal rates. The studies consistently fail to find evidence supporting the much hypothesized short-term, negative relationship between money and nominal rates since at least April 1975. Reasons for the absence of a negative relationship include the tendency of financial markets to anticipate corrective action by the Fed whenever M1 deviates from targeted growth ranges and a rapid adjustment of inflationary expectations to

changes in money growth. *Econ. Inquiry*, Jan. 1987, 25(1), pp. 67-82. North Texas State University.

**Sims, Grant E.; Takayama, Akira and Chao, Chi-chur**—A Dual Approach to Measuring the Nearness of Near-Monies

The authors address the problem of measuring the degree of substitution of near-monies, the problem provoked by V. Karuppan Chetty (1969) from which followed many studies. Applying the dual approach developed in production economics to this problem, the authors are able to estimate the degree of substitution among near-monies simultaneously for the  $n$ -dimensional world allowing possible complementarities, in which they also test the homotheticity assumption and the existence of "non-neutral" institutional changes. The approach, being a fresh one on this topic, enables the authors to obtain many new results and gives further insight into this much-debated problem. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 118-27. Transco Energy Co., Houston; Southern Illinois University, Carbondale; Southern Illinois University, Carbondale.

**Spindt, Paul A. and Tarhan, Vefa**—The Federal Reserve's New Operating Procedures: A Post Mortem

Although money stock targeting has been the strategic focus of Federal Reserve policy since the mid 1970s, operating policy—the tactics whereby the longer-run strategy is implemented over short-term intervals—has been changed by the Federal Reserve at least twice over this period. A particularly dramatic change in operating policy was announced by the Federal Reserve in October 1979. This paper provides empirical evidence that settles questions about the nature of this change and suggests that the new operating procedures may have contributed to the heightened interest rate volatility experienced over the 1979 to 1982 period. *J. Monet. Econ.*, Jan. 1987, 19(1), pp. 107-23. Board of Governors of the Federal Reserve System, Washington, D.C.; Loyola University.

**Townsend, Robert M.**—Asset-Return Anomalies in a Monetary Economy

This paper provides a general equilibrium, choice theoretic, spatial model, which explains the preference for holding barren money rather than interest-bearing securities or capital goods. Put somewhat differently, it examines standard asset pricing relationships in the context of a fully articulated monetary economy and delivers various asset return anomalies. In seeking to integrate the theory of value with the theory of money, a fairly general proof of the existence of a monetary equilibrium is provided. *J. Econ. Theory*, Apr. 1987, 41(2), pp. 219-47. University of Chicago.

**Vickers, John**—Signalling in a Model of Monetary Policy with Incomplete Information

The expectations of the public about future macroeconomic policy depend in part upon the preferences that they believe the policymaker to have. For example, when the policymaker is "dry"—i.e., more concerned about low inflation than low unemployment—lower inflation might be expected than when he is "wet." Thus, there is an incentive for the policymaker to influence expectations about his preferences by means of his current policy decisions. This paper uses R. Barro and D. Gordon's natural rate model and draws on recent work in oligopoly to investigate the use of monetary policy as a signal of the policymaker's preference. *Oxford Econ. Pap.*, Nov. 1986, 38(3), pp. 443-55. Nuffield College, Oxford.

### 312 Commercial Banking

**Aliber, Robert Z.**—Financial Innovation and the Boundries of Banking

This paper analyzes the interaction of the process of international innovation and the structure of the international banking sector. The advent of new instruments of financing resulted in the growth of disintermediation. This created pressure for the liberalization of banking with the resulting international competition. The banking sector in the United States is fragmented and offers a widely differing range of services. Innovation has resulted in a change in structure, a reshuffling of participants and a consolidation of financial centers. *Managerial Dec. Econ.*, Mar. 1987, 8(1), pp. 67-73. University of Chicago.

**Broll, Udo and Gilroy, Michael B.—Collateral in Banking Policy and Adverse Selection**

This paper analyzes collateral in banking policy and adverse selection effects given information asymmetry. It is shown that with asymmetric information, given the interest rate, one cannot expect collateral to equilibrate the market for loans. The reason is that the average riskiness of a loan will be positively related to the collateral agreement. Hence the gain for the bank from higher collateral will be compared with the adverse selection loss leading to an optimum collateral, which need not be market clearing. *Manchester Sch. Econ. Soc. Stud.*, Dec. 1986, 54(4), pp. 357-66. University of Constanstanz, West Germany.

**Hannan, Timothy H. and Rhoades, Stephen A.—Acquisition Targets and Motives: The Case of the Banking Industry**

Findings do not indicate poorly-managed firms are more likely to be acquired than well-managed firms. The analysis uses a sample of 1,046 Texas banks that existed in 1970, out of which 201 were acquired during the period 1970-82. A multinomial logit procedure is used to estimate the relationship between the likelihood of acquisition and the characteristics of the target firm and its market. Additional results suggest that firms with large market shares, low capital/asset ratios, and operations in urban areas are relatively likely to be acquired but not firms with low profits or low growth. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 67-74. Federal Reserve Board.

**Rose, Peter S.—The Impact of Financial Services Deregulation: The Hypotheses and the Evidence from 240 U.S. Metropolitan Markets**

This study examines several deregulation hypotheses regarding changes in commercial bank profitability, risk, operating efficiency, portfolio mix, and market structure using individual bank and marketwide data from 240 U.S. metropolitan areas. The timing of deregulation laws are found to have a significant influence on bank and bank market performance indicators and economic, demographic, and market structure factors. Deregulation's impact, however, is found to be selective according to bank size

and market location. *Quart. J. Bus. Econ.*, Spring 1987, 26(2), pp. 55-88. Texas A&M University.

**313 Capital Markets**

**Atchison, Michael D.; Butler, Kirt C. and Simmonds, Richard R.—Nonsynchronous Security Trading and Market Index Autocorrelation**

This paper investigates the extent to which nonsynchronous security trading explains observed autocorrelations in daily returns on stock market indices. The theoretical portfolio autocorrelation due solely to nonsynchronous trading is estimated from a derived model. This estimated level is found to be substantially less than that observed empirically. The theoretical and empirical relationship between portfolio size and autocorrelation is also investigated. The results of this study suggest that other price-adjustment delay factors, in addition to nonsynchronous trading, cause the high autocorrelations present in daily returns on stock index portfolios. *J. Finance*, Mar. 1987, 42(1), pp. 111-18. University of Virginia; Michigan State University; Michigan State University.

**Bruner, Robert F. and Simms, John M., Jr.—The International Debt Crisis and Bank Security Returns in 1982**

This research investigates the reaction of bank security returns to the 20 August 1982 Mexican request for the rescheduling of its external debt. Empirical results show that the reaction of bank stocks was rapid and significantly negative. Within six days of the published announcement, prices had adjusted to reflect levels of individual bank exposure, which refutes the much longer time implied in other studies of this event. The authors conclude that the market reaction was essentially efficient, rational, and orderly. *J. Money, Credit, Banking*, Feb. 1987, 19(1), pp. 46-55. University of Virginia; The First Boston Corporation, New York.

**Campbell, John Y. and Clarida, Richard H.—The Term Structure of Euromarket Interest Rates: An Empirical Investigation**

This paper is an empirical investigation of the predictability and comovement of risk pre-

mia in the term structure of Euromarket interest rates. The authors present regression results which suggest that risk premia in three Euromarket term structures and on uncovered foreign asset positions move together. The authors test formally the hypothesis that these risk premia move in proportion to a single latent variable and are unable to reject this hypothesis. The single latent variable model can be interpreted as in L. Hansen and R. Hodrick (1983) and R. Hodrick and S. Srivastava (1984) as a specialization of the intertemporal capital asset pricing model in which assets have constant betas on a single, unobservable benchmark portfolio. *J. Monet. Econ.*, Jan. 1987, 19(1), pp. 25-44. Princeton University; Yale University.

**Corhay, Albert; Hawawini, Gabriel and Michel, Pierre**—Seasonality in the Risk-Return Relationship: Some International Evidence

The authors report evidence of monthly seasonality in the estimate of the CAPM-based equity risk premium on the NYSE and the London, Paris, and Brussels exchanges. In Belgium and France, the risk premium is positive in January and negative the rest of the year. In the United Kingdom, it is positive in April and negative the rest of the year. In the United States, the pattern of risk-premium seasonality coincides with the pattern of stock-return seasonality. Both are positive and significant only in January. This is not the case in the European markets. An interpretation of this phenomenon is suggested. *J. Finance*, Mar. 1987, 42(1), pp. 49-68. University of Liège, Belgium; INSEAD, Fontainebleau, France; University of Liège, Belgium.

**Da Silva, Roberto and Dellva, Wilfred L.**—Evidence of the Size Effect on Stock Returns in the Chemical Industry

This study examines the evidence of the size effect on stock returns in the chemical industry using both the CAPM and the market model. While the results are generally consistent with earlier random sample studies, the industry specific study provides some interesting twists. CAPM results indicate significant abnormal returns, while market model results are not statistically significant. *Quart. J. Bus. Econ.*, Spring

1987, 26(2), pp. 22-40. Monsanto Corporation, Sao Paulo, Brazil; St. Joseph's University.

**Downen, Richard J. and Bauman, W. Scott**—Residual Returns and Extramarket Risk

Several studies have found that stock with low price-earnings ratios with small capitalizations and neglected stocks have higher returns than can be justified by their beta or market risk. This study seeks to determine whether there is extramarket risk associated with such portfolios. Extramarket risk may account for excess returns. The results suggest that extramarket risk is not present. *Quart. J. Bus. Econ.*, Spring 1987, 26(2), pp. 41-54. Northern Illinois University.

**Dukes, William P.; Bowlin, Oswald D. and MacDonald, S. Scott**—The Performance of Beta in Forecasting Portfolio Returns in Bull and Bear Markets Using Alternate Market Proxies

This paper shows the risk-return relationships for stock portfolios during bull and bear markets using alternative market proxies. The findings support the concept of beta stationarity and suggest strongly that systematic risk is useful in predicting portfolio returns in bull and bear markets, especially when the Value Line composite is used as a market proxy. *Quart. J. Bus. Econ.*, Spring 1987, 26(2), pp. 89-103. Texas Tech University.

**Engle, Robert F.; Lilien, David M. and Robins, Russell P.**—Estimating Time Varying Risk Premia in the Term Structure: The ARCH-M Model

The expectation of the excess holding yield on a long bond is postulated to depend upon its conditional variance. Engle's ARCH model is extended to allow the conditional variance to be a determinant of the mean and is called ARCH-M. Estimation and inference procedures are proposed, and the model is applied to three interest rate data sets. In most cases the ARCH process and the time varying risk premium are highly significant. A collection of LM diagnostic tests reveals the robustness of the model to various specification changes such as alternative volatility or ARCH measures, regime changes, and interest rate formulations.

The model explains and interprets the recent econometric failures of the expectations hypothesis of the term structure. *Econometrica*, Mar. 1987, 55(2), pp. 391-407. University of California, San Diego; University of California, Irvine; TransWorld Oil, Ltd., Hamilton, Bermuda.

**Fama, Eugene F. and French, Kenneth R.**—Commodity Futures Prices: Some Evidence on Forecast Power, Premiums, and the Theory of Storage

The authors examine two models of commodity futures prices. The theory of storage explains the difference between contemporaneous futures and spot prices (the basis) in terms of interest changes, warehousing costs, and convenience yields. The authors find evidence of variation in the basis in response to both interest rates and seasonals in convenience yields. The second model splits a futures price into an expected premium and a forecast of the maturity spot price. The authors find evidence of forecast power for 10 of 21 commodities and time-varying expected premiums for five commodities. *J. Bus.*, Jan. 1987, 60(1), pp. 55-73. University of Chicago.

**Garber, Peter M.**—Nominal Contracts in a Bimetallic Standard

As its central feature, a bimetallic standard grants nominal debtors an option to deliver either of two metals. With results from the option pricing literature, construction of a formula to evaluate the bimetallic option in debt instruments is straightforward. With this formula, one can compute the option value in a wide range of nineteenth-century U.S. Treasury securities. Possession of the option values permits an adjustment of the yields on U.S. securities to make them comparable to yields on nonmetallic European securities. Evaluating the option allows the estimation of transfers from debtors to creditors. *Amer. Econ. Rev.*, Dec. 1986, 76(5), pp. 1012-30. Brown University.

**Grinblatt, Mark and Titman, Sheridan**—The Relation between Mean-Variance Efficiency and Arbitrage Pricing

This paper generalizes the relation between the mean-variance efficiency of a reference portfolio and exact linear pricing to a multibeta

setting. The concept of local mean-variance efficiency is introduced, and a group of reference portfolios is shown to price all assets if, and only if, they are locally efficient. Within this alternative framework, the paper examines the testability of the Arbitrage Pricing Theory. Whereas the Capital Asset Pricing Model implies that only the market portfolio is efficient and generally says nothing about which observable portfolios are efficient when examining subsets of the economy, the Arbitrage Pricing Theory pricing equation implies that the factor analysis portfolios are locally efficient. For this and several other reasons, the Arbitrage Pricing Theory is inherently more testable. *J. Bus.*, Jan. 1987, 60(1), pp. 97-112. University of California, Los Angeles.

**Hartley, Peter**—Portfolio Theory and Foreign Investment—The Role of Non-marketed Assets

Far from thinking the extent of foreign investment in Australia is large, economists ought perhaps be surprised that the extent is not greater. Portfolio diversification theory would seem to predict Australians would own a small share of their marketable wealth in Australian marketed assets. When domestic residents in a small open economy possess nonmarketable wealth (so that securities markets are not complete), domestic marketed assets may be disproportionately demanded by residents to hedge their nonmarketed risks. *Econ. Rec.*, Sept. 1986, 62(178), pp. 286-95. Monash University and Princeton University.

**Hirst, Ian**—Restrictions on Outward Portfolio Investment and Domestic Equity Markets

Governments sometimes impose restrictions on local investors which effectively prevent them from purchasing overseas equities. Reasons for doing this, from the government's point of view, would include increasing the availability and lowering the cost of risk capital for local companies. This paper analyzes this argument in terms of modern portfolio theory. It is shown that, under certain circumstances, domestic equities and overseas equities may be complements rather than substitutes. In this case, the effect of the restrictions would be to lower prices on the domestic stock exchange and to

raise the cost of risk capital to local companies. *Managerial Dec. Econ.*, Mar. 1987, 8(1), pp. 75-80. University of Edinburgh.

**Hochman, Shalom and Palmon, Oded**—Expected Inflation and the Real Rates of Interest on Taxable and Tax-Exempt Bonds

This paper analyzes the impact of inflation on rates of return on taxable corporate bonds and tax-exempt municipal bonds. The paper considers a differential tax system, where the tax rate depends on both the identity of the investor and the source of income. It also considers the possibility that inflation may induce investors to switch from holding one asset to holding another. It is demonstrated that while inflation should increase the (pre-personal tax) real rate of interest on taxable bonds, it should reduce the real rate of interest on tax-exempt bonds. *J. Money, Credit, Banking*, Feb. 1987, 19(1), pp. 90-103. University of Houston.

**Huberman, Gur; Kandel, Shmuel and Stambaugh, Robert F.**—Mimicking Portfolios and Exact Arbitrage Pricing

The authors characterize the sets of mimicking positions whose returns can serve in place of factors in an exact  $K$ -factor arbitrage pricing relation for a set of  $N$  assets. All of the sets are  $K$ -dimensional nonsingular linear transformations of each other. The authors interpret three examples of such transformations and discuss empirical considerations. They also provide conditions under which the mimicking positions can be expressed as portfolios and characterize the relation between mimicking portfolios and the minimum-variance frontier. *J. Finance*, Mar. 1987, 42(1), pp. 1-9. University of Chicago.

**James, Christopher M. and Wier, Peggy**—Returns to Acquirers and Competition in the Acquisition Market: The Case of Banking

In this paper the authors examine the effect of competition in the market for bank acquisitions on the acquirers' stock returns. Bank acquisitions are examined because federal and state regulations greatly facilitate the identification of potential bidders and alternative targets in an acquisition. They find that the gain to an acquisition is positively related to the number

of alternative target firms available and negatively related to the number of other potential bidders. These results provide some insights into the sources of gains from bank acquisitions. *J. Polit. Econ.*, Apr. 1987, 95(2), pp. 355-70. University of Oregon.

**Jüttner, D. Johannes; Tuckwell, Roger H. and Luedecke, Bernd P.**—Are Expectations of Short-term Interest Rates Rational?

The paper investigates whether expectations of short-term interest rates, as measured by either the futures rate for bank bills or the implied forward rate in the spot market for such bills, are formed rationally in the Muthian sense. A feature of the approach is the explicit integration of overseas interest rate expectations. The results indicate that market participants draw on a more comprehensive information set when setting implied forward rates than when pricing futures contracts and that, as a result, there does appear to be scope for profitable arbitrage between the two markets. *Australian Econ. Pap.*, Dec. 1985, 24(45), pp. 356-69. Macquarie University; Macquarie University; University of New South Wales.

**Kidwell, David S. and Marr, M. Wayne**—Preferred Stock: The Impact of Credit Market Conditions on Competitive versus Negotiated Sale

The study examines the issue-cost relationship between competitive and negotiated sales for a sample of public utility preferred stock sold between 1974 and 1980. The study's major findings are that during stable credit markets, most preferred stock issuers will achieve the lowest issue cost using competitive sales. During unstable market periods, the results are quite different. Negotiated sales will provide the lowest issue cost if two or fewer competitive bids are expected; if three or more bids are expected, no cost difference exists between the two methods of sale. Thus, under unstable market conditions negotiated sales may be preferable. *Quart. Rev. Econ. Bus.*, Winter 1986, 26(4), pp. 35-50. Tulane University.

**McConnell, John J. and Sanger, Gary C.**—The Puzzle in Post-listing Common Stock Returns

Prior studies indicate that common stocks tend to earn negative returns immediately following listing on the NYSE. The authors document the phenomenon in detail and investigate a number of possible explanations. No full explanation is discovered although several are ruled out. *J. Finance*, Mar. 1987, 42(1), pp. 119-40. Purdue University; Louisiana State University.

**Ogden, Joseph P.—An Analysis Of Yield Curve Notes**

This paper analyzes a new security, the yield curve note, which pays interest at a rate that varies inversely with short-term interest rates. A valuation model is presented, the parameters of the model are estimated empirically, and the estimated model is used to explore the price behavior and risk characteristics of yield curve notes in comparison with fixed rate notes. The risk of a yield curve note is approximately twice as great as a fixed rate note with the same maturity. The unique risk characteristics of yield curve notes make them useful in immunization strategies for financial institutions. *J. Finance*, Mar. 1987, 42(1), pp. 99-110. University of Tennessee.

**Oldfield, George S. and Rogalski, Richard J.—The Stochastic Properties of Term Structure Movements**

The aim of this paper is to identify a stationary statistical model for Treasury bill discount changes. The authors find that the sample variance of discount changes are nonstationary over short differencing intervals but stabilize as the intervals increase to quarterly or semiannual periods. This result has important implications for pricing options and for analyzing the predictive properties of forward rates. The authors show that the stochastic process structure leads to a downward revision in estimates of forward rate predictive power. *J. Monet. Econ.*, Mar. 1987, 19(2), pp. 229-54. Cornell University; Dartmouth College.

**330 FISCAL THEORY AND POLICY; PUBLIC FINANCE**

**331 Fiscal Theory and Policy**

**Browning, Edgar K.—On the Marginal Welfare Cost of Taxation**

This paper develops a rigorous partial equilibrium analysis of the determinants of marginal welfare cost (MWC) of taxes on labor earnings. It shows that four key parameters interact to determine the magnitude of MWC. Using aggregate data and plausible ranges of values for the parameters, MWC can vary from under 10 percent to more than 300 percent of marginal tax revenue. Intermediate parameter values suggest MWC is in the 25-50 percent range. However, the more extreme estimates cannot be ruled out on the basis of available evidence, suggesting that MWC cannot yet be estimated with much precision. *Amer. Econ. Rev.*, Mar. 1987, 77(1), pp. 11-23. Texas A&M University.

**Cauley, Jon; Sandler, Todd and Cornes, Richard—Nonmarket Institutional Structures: Conjectures, Distribution, and Allocative Efficiency**

This paper analyzes nonmarket institutional structure in which policy makers from two or more governments negotiate to commonly provide a pure public good or to internalize an externality. Various equilibrium notions for the linkage are examined, including Nash, non-Nash, and Pareto. The theoretical analysis indicates when distributional aspects can be separated from efficiency considerations for a non-market linkage. In addition, the authors demonstrate that the likelihood of initial formation of such a linkage is related to the number of participants, the type of conjecture formed, and the mix between fixed and variable negotiation costs. *Public Finance*, 1986, 41(2), pp. 153-72. University of Hawaii, Hilo; Iowa State University; Australian National University.

**Chamley, Christophe and Wright, Brian D.—Fiscal Incidence in an Overlapping Generations Model with a Fixed Asset**

In a model of overlapping generations with a fixed factor ("land"), malleable capital, and labor, the authors analyze the dynamic effects of various fiscal policies on capital accumulation, land prices, and intergenerational welfare. Minimal assumptions (stability and uniqueness of the dynamic path) imply that a land tax may initially raise land values, but the upper bound is less than one-half of the tax revenues. Assuming homothetic utility, the ratio between the

long-run capital responses to a land tax and to a lump-sum transfer of equivalent revenue from the young to the old depends solely on the labor share. *J. Public Econ.*, Feb. 1987, 32(1), pp. 3-24. Hoover Institution, Stanford University; University of California, Berkeley.

**Ekelund, Robert B., Jr. and Thornton, Mark**—Schumpeterian Analysis, Supply-Side Economics, and Macroeconomic Policy in the 1920s

Supply-side policies, and specifically tax cuts, were a major causal factor in the prosperity of the 1920s. Simple empirical tests are used to support this position. An opposing view—that prosperity and tax cuts resulted from general Schumpeterian expansion—is refuted with Schumpeter's own view that tax policy is a major determinant of economic activity and growth in economic aggregates. Further, the authors analyze the contemporary interest in supply-side economics and discuss the important insights that supply-side concepts have for economic stability and growth. *Rev. Soc. Econ.*, Dec. 1986, 44(3), pp. 221-37. Auburn University.

**Gordon, Roger, H.**—Taxation of Investment and Savings in a World Economy

The equilibrium of capital and equilibrium market prices are derived for a world economy with a unified securities market, mobile capital, no uncertainty, and varying tax rates on different sources of income in each country. The paper then characterizes optimal tax rates for a small country in this setting, focusing on the peculiar incentives created when the before-tax rate of return differs among securities due to differences in their typical tax treatment. *Amer. Econ. Rev.*, Dec. 1986, 76(5), pp. 1086-102. University of Michigan.

**Koford, Kenneth**—Innovation and Adaptation under Incentive Anti-inflation Plans

This paper examines the effects of incentive anti-inflation plans upon a firm's incentives to innovate and to adapt to shocks. Such plans create a uniform tax upon price increases and subsidy for price decreases. The incentive to innovate depend upon the

ally reduces firms' incentives to develop demand-increasing innovations and speed of adjustment to demand and input price shocks. Another rule reduces the profits from highly successful innovations, but increases the profits from less successful innovations, with uncertain overall effect on the incentive to innovate. *Public Finance*, 1986, 41(2), pp. 218-31. University of Delaware.

**Kofuji, Yasuo**—Wealth Effects and Fiscal Policy in the Context of a Flexible Price Level

In reexamining an earlier model by Fiorella Padoa Schippa, it is found that under a flexible price level and with wealth effects, (1) bond financing of public expenditure leads to instability, whereas money finance is always stable; (2) crowding-out of private by public expenditure is logically compatible with stability under bond but not under money finance; (3) if the system is stable, bond financing may create a larger or smaller real income compared with money finance, however, the wealth effects stemming from price level changes play an important role in the determination of these effects. *Public Finance*, 1986, 41(2), pp. 232-43. Senshu University, Japan.

**Latham, Roger W. and Naisbitt, Barry**—Balanced Budget Tax Incidence

This paper extends the analysis of the Harberger two-sector tax incidence model to examine different assumptions about government and individual demand behavior. In particular, differences in preferences among individuals and the concepts of the distributions of personal income and the ownership of capital are introduced into the model. Incidence propositions are derived assuming firstly, following Harberger, that the government spends tax revenues as a typical individual would spend income and secondly that tax revenue is used to finance lump-sum transfers to individuals. The propositions are shown to accord with those existing in the literature. *Public Finance*, 1986, 41(2), pp. 244-59. York University; University of Liverpool.

**Lee, Kye Sik**—Pareto Optimal Redistribution: A Public Good Approach

A general equilibrium model with the Lin-

ome scheme which highlights the public nature of income distribution is presented. The introduction of the CES utility function, the Atkinson index of equality, and condensed S. income data. The Pareto optimal tax structure is shown to be more progressive all in all, the stronger the degree of inequality aversion and the weaker the degree of substitutability between public and private goods. Most markedly, the optimal tax structure is identified as lump-sum/regressive with increasing progressivity/proportionality/degressivity, depending on alternative degrees of substitutability. *Public Finance*, 1986, 41(2), pp. 200-17. Korea Development Institute, Seoul.

**Mankiw, N. Gregory**—Government Purchases and Real Interest Rates

This paper examines the dynamic impact of government purchases in a simple general equilibrium model with both durable and nondurable consumer goods as well as productive capital. The model generates perhaps surprising results. In particular, increases in government purchases are shown to cause reductions in real interest rates. The model thus provides a possible explanation for the observed behavior of real interest rates around wars. *J. Polit. Econ.*, Apr. 1987, 95(2), pp. 407-19. Harvard University.

**McCain, Roger A.**—Costs of Transaction and a Theory of Public Policy

The paper begins by reconciling two views of public policy in the light of transaction costs, which draw opposite conclusions. The contrary views are those of the Coasian school and of Burnham Beckwith. On the basis of the synthesis which results, the paper proposes a maxim for efficient government policy, and shows how such classical cases as public goods, Keynesian economic stabilization, and redistribution of income come within the scope of the maxim. *Rev. Soc. Econ.*, Dec. 1986, 44(3), pp. 238-50. Fordham University and Brooklyn College.

**Okuno, Nobuhiro**—Public Investment and Unequalitarian Equilibrium

Effects of public investment on income-wealth distribution is analyzed using a neoclassical growth model with income-wealth in-

equalities. The author considers income groups which differ in their wealth holdings but have the same strictly convex savings function. A neoclassical growth model with these features has a locally stable unequalitarian equilibrium. The author makes some comparative analyses of unequalitarian steady paths with respect to public investment. It is shown that public investment is likely to expand income-wealth inequality even though it raises per capital national income. *Public Finance*, 1986, 41(2), pp. 260-66. Nagoya University, Japan.

**van der Ploeg, F.**—The Effects of a Tax and Incomes Policy on Government Finance, Employment and Capital Formation

A tax and incomes policy is proposed to alleviate the problem of unemployment. Income taxes and wages are simultaneously reduced to leave the post-tax real wage unaffected. This will stimulate employment, but may lead to a never-ending expansion of government debt unless there is a shift from bond-finance to money-finance. The main disadvantage of this scheme is that money-finance is more inflationary, but this may not matter as the net real wage is unchanged. However, when allowance is made for the role of capital formation, the inflationary consequences of money-finance will stimulate investment and contribute to a further expansion of activity and employment. The effects of two other reflationary packages are also investigated. *De Economist*, 1986, 134(3), pp. 269-88. London School of Economics and Tilburg University.

**Rankin, Neal**—Debt Policy under Fixed and Flexible Prices

The effects of an increase in the stock of government bonds are considered in an economy with overlapping generations and perfect foresight, and in the absence of intergenerational bequests. The cases where prices adjust instantaneously to clear markets and where prices are exogenously fixed, are contrasted (1) in a model with capital accumulation but an exogenous labor supply and (2) in a model with exogenous capital but endogenous labor supply. James Tobin's intuitive argument that, in the absence of bequests, higher debt reduces long-run welfare if prices are flexible, but increases

long-run capital responses to a land tax and to a lump-sum transfer of equivalent revenue from the young to the old depends solely on the labor share. *J. Public Econ.*, Feb. 1987, 32(1), pp. 3-24. Hoover Institution, Stanford University; University of California, Berkeley.

**Rankin, Neal**—Debt Policy under Fixed and Flexible Prices

The effects of an increase in the stock of government bonds are considered in an economy with overlapping generations and perfect foresight, and in the absence of intergenerational bequests. The cases where prices adjust instantaneously to clear markets and where prices are exogenously fixed, are contrasted (1) in a model with capital accumulation but an exogenous labor supply and (2) in a model with exogenous capital but endogenous labor supply. James Tobin's intuitive argument that, in the absence of bequests, higher debt reduces long-run welfare if prices are flexible, but increases

it if fixed, so producing Keynesian unemployment, is correct for (1) but incorrect for (2) at high levels of employment. *Oxford Econ. Pap.*, Nov. 1986, 38(3), pp. 481-500. Queen Mary College and University of London.

**Rankin, Neal**—Disequilibrium and the Welfare-Maximising Levels of Government Spending, Taxation and Debt

A "disequilibrium" framework, which extends that of R. J. Barro and H. I. Grossman (1971) and E. Malinvaud (1977) to include overlapping generations and dynamics due to perfect foresight and the accumulation of bonds and capital, is used to determine when a welfare-maximizing fiscal policy requires a higher level of government spending than in Walrasian equilibrium. When deficits are permitted, optimum spending either equals the Walrasian optimum, or differs in a way depending arbitrarily on preferences. When a balanced budget is imposed, two situations which may justify spending clearly above the Walrasian optimum are: (1) when capital accumulation is included; (2) when spending provides utility to consumers. *Econ. J.*, Mar. 1987, 97(385), pp. 65-85. Queen Mary College, University of London.

**Rapanos, Vassilis**—Variable Returns to Scale and Tax Incidence: An Extension of Harberger's Model

This paper investigates the incidence of the corporation income tax under variable returns to scale. The approach followed is the one suggested by A. Harberger (1962). If the elasticity of substitution between commodities in consumption is different from one, then the influence of variable returns to scale on tax incidence is very important. Although, as in Harberger, tax incidence depends crucially on factor intensities, the quantitative aspects are quite different and this is due to the presence of variable returns to scale. There are also certain conditions under which the presence of variable returns to scale does not affect Harberger's results. *J. Econ. (Z. Nationalök.)*, 1986, 46(4), pp. 397-406. Permanent Greek Delegation to OECD, Paris.

**Revesz, John T.**—On some Advantages of Progressive Indirect Taxation

The main purpose of this paper is to disprove a proposition currently prevailing in the literature, that given weakly separable utility between commodities and leisure, there is no need to impose taxes on commodities, provided the income tax function is optimal. Following presentation of a counterexample, the author examines some benefits involved in including indirect taxation in relation to work incentives and the higher degree of progression attainable with an optimal mixed regime. *Public Finance*, 1986, 41(2), pp. 182-99. Department of Industry, Technology, and Commerce, Canberra, Australia.

**Roberts, Russell D.**—Financing Public Goods

Public goods can be financed by direct taxation or a subsidy to private spending. This paper examines the relative efficiency and distributional consequences of the two methods. Efficiency is shown to depend on the price elasticity of private spending and the trade-off between public and private spending. When this trade-off is dollar for dollar, however, a subsidy is always more efficient than direct taxation. The gains from a subsidy are larger for a mixed good than for a pure public good. Looking at distributional effects, the author shows when richer taxpayers may prefer a tax credit to deductibility, even though they face lower prices with deductibility, and also shows when richer taxpayers prefer direct taxation to either type of subsidy. *J. Polit. Econ.*, Apr. 1987, 95(2), pp. 420-37. University of Rochester and Hoover Institution.

**Ross, Stephen A.**—Arbitrage and Martingales with Taxation

This paper extends the martingale analysis of no arbitrage pricing to worlds with taxation. The absence of arbitrage is shown to imply the existence of different shadow prices for income streams that are subject to differing tax treatments. For example, no arbitrage implies the existence of different martingale measures for capital gains and for ordinary income when they are differentially taxed, and for items such as depreciation expenses that influence only after-tax cash flows. The analysis is applied to several topics in finance including the debt/equity decision, tax options, and the taxation of dividends

and pensions. *J. Polit. Econ.*, Apr. 1987, 95(2), pp. 371-83. Yale University.

**Svensson, Lars-Gunnar—National Income and Marginal Taxes**

A simple model of linear taxation is used to single out different types of tax equilibria. Sufficient conditions for national income to be a decreasing function of the marginal tax rate are given for each case. Equilibria are classified according to whether (1) aggregate labor supply is forward bending, (2) aggregate labor supply is backward bending, (3) the equilibrium is a welfare maximum, and (4) the equilibrium is a "political equilibrium." *Scand. J. Econ.*, 1986, 88(4), pp. 565-81. University of Lund.

**Wibaut, Serge R.—A Model of Tax Reform for Belgium**

This paper proposes a solution to the problems of second-best and tax reform for economies characterized by so-called Keynesian unemployment, i.e., excess supply of both labor and goods. Results of an econometric model suggest that welfare improving tax directions may have been found in Belgium in 1982. *J. Public Econ.*, Feb. 1987, 32(1), pp. 53-77. CORE, Catholic University of Louvain, Belgium.

**322 National Government Expenditures and Budgeting**

**Eisner, Robert—The Real Federal Deficit: What It Is, How It Matters, and What It Should Be**

Budget deficits do matter, but to know how, we must measure them right. Real high-employment budget deficits, adjusted for inflation effects on outstanding debt, are positively associated with subsequent increases in real GNP and reductions in unemployment. Apparent deficits in the 1970s were really surpluses. Tight fiscal as well as tight monetary policy thus contributed to the deep recession of 1981-1982. The huge swing to real deficit in 1982 was a major factor in the recovery. Balanced official budgets, as demanded by Gramm-Rudman, would entail real surpluses likely to stifle economic growth and increase unemployment. *Quart. Rev. Econ. Bus.*, Winter 1986, 26(4), pp. 6-21. Northwestern University.

**323 National Taxation, Revenue, and Subsidies**

**Fullerton, Don—The Indexation of Interest, Depreciation, and Capital Gains and Tax Reform in the United States**

The Treasury's 1984 plan is a more comprehensive income tax, including the indexation of interest, depreciation, and capital gains. The 1985 President's proposal retains some of this indexation. The author measures the incentives under each regime to make marginal investments in the corporate, noncorporate and housing sectors. Inflation causes current effective tax rates to rise for some assets and fall for others. Overall rates fall with inflation, and the corporate tax is completely offset by credits, allowances, and deductions. Under the proposals, the corporate tax reemerges, effective tax rates are much more uniform, and the interference of inflation is virtually eliminated. *J. Public Econ.*, Feb. 1987, 32(1), pp. 25-51. University of Virginia.

**Meagher, G. A.—An Empirical Analysis of the Effects of a Change in the Mix of Direct and Indirect Taxation**

This paper analyzes macroeconomic and structural effects of a change in the tax mix. Consumption taxes are increased and PAYE income taxes reduced so as to maintain the real value of total disposable income. The analysis is conducted using an extended version of the ORANI multisectoral model of the Australian economy. The results indicate that, in the absence of a fall in post-tax real wages, the change in the tax mix will increase inflation, reduce employment, and push the balance of trade towards deficit. The changes will be greater the more the direct tax cuts are appropriated as increases in post-tax wages. *Australian Econ. Pap.*, June 1986, 25(46), pp. 47-56. University of Melbourne.

**Paqué, Karl-Heinz—The Efficiency of Tax Incentives to Private Charitable Giving—Some Econometric Evidence for the Federal Republic of Germany**

This paper presents some econometric estimates of income and price elasticities of charitable contributions for the Federal Republic of Germany. In the major specifications, both elasticities turn out to be well above one in

absolute terms. Tax policy simulations on basis of these estimates indicate that a more generous tax treatment than the current income tax deduction of charitable giving may be warranted on economic efficiency grounds. In addition, some estimates of the crowding-out effect of public spending on private charitable contributions are presented and discussed. *Weltwirtsch. Arch.*, 1986, 122(4), pp. 690-712. Institut für Weltwirtschaft, Kiel.

**Pauwels, Wilfried**—Correct and Incorrect Measures of the Deadweight Loss of Taxation

Deadweight loss of taxation can be measured in two ways: either as the gain that could have been realized if all taxes had been lump sum or as the loss that would remain if all tax receipts would be returned, in a lump sum way, to the consumer. These two approaches yield different loss measures. Moreover, within each of the two approaches, two loss measures can be defined, one based on the equivalent variation and the other based on the compensating variation. It will be shown that all of the measures based on the compensating variation are unreliable. *Public Finance*, 1986, 41(2), pp. 267-76. University of Antwerp.

**Ray, Ranjan**—Redistribution through Commodity Taxes: The Nonlinear Engel Curve Case

This paper attempts to measure the redistributive effects of commodity taxation within a nonlinear Engel curve framework. A recent nonlinear demand system (RNLPS) is estimated on Indian budget data and the parameter estimates are used in conjunction with actual tax rates to quantify possible redistribution. The results point to the very limited redistribution that can be achieved by relying on commodity taxation alone. *Public Finance*, 1986, 41(2), pp. 277-84. Delhi School of Economics.

**324 State and Local Government Finance**

**Behrman, Jere R. and Craig, Steven G.**—The Distribution of Public Services: An Exploration of Local Governmental Preferences

A local governmental welfare function is specified to explore two of its central characteristics: the equity-productivity trade-off and differential weights across neighborhoods. The con-

strained maximization model is estimated using service outcomes (safety) in the welfare function, as opposed to publicly provided inputs (police), over neighborhoods. The equity-productivity trade-off is found to be considerable, and not all neighborhoods are weighted equally. The results show that inequality aversion and unequal concern by local government over service outcomes must be addressed explicitly to understand the observed distribution of publicly provided inputs, with important implications for standard analysis of local governmental behavior. *Amer. Econ. Rev.*, Mar. 1987, 77(1), pp. 37-49. University of Pennsylvania; University of Houston.

**Deno, Kevin T. and Mehay, Stephen L.**—Municipal Management Structure and Fiscal Performance: Do City Managers Make a Difference?

Previous research argued that the city manager is more efficient than the mayor-council form of municipal government. However, this paper presents evidence that municipal management structure has no significant impact on municipal expenditures. If political competition is vigorous, elected council members will adopt budgets consonant with the median voter's preferences. This result should hold regardless of the form of city management structure. The authors tested a simple median voter model of local public spending with alternate samples of U.S. cities and were unable to detect a significant difference in expenditures between the two management structures. *Southern Econ. J.*, Jan. 1987, 53(3), pp. 627-42. University of Connecticut; U.S. Naval Postgraduate School, Monterey, California.

**Merriman, David**—The Distributional Effects of New Jersey's Tax and Expenditure Limitation

A uniform state limit on per capita local government spending will affect high tax capacity communities more than those with low tax capacity (all else equal). However, if other determinants of spending vary and/or allowed spending depends upon characteristics of the community other than tax capacity, a constraint may affect poor communities more than wealthy ones. Empirical analysis of New Jersey data

demonstrates that tax capacity is one of the most important determinants of spending. New Jersey's constraint on spending growth is shown to have affected high tax capacity and low density communities most. *Land Econ.*, Nov. 1986, 62(4), pp. 353-61. University of Texas, Dallas.

### 325 Intergovernmental Financial Relationships

**Dafflon, Bernard and Solari, Paolo**—Les part des canton aux recettes fédérales: évolution et incidences en 1983 (The System of Revenue-Sharing between the Federal Government and the Cantons of Switzerland: Evolution and Incidence in 1983)

This paper presents the system of revenue sharing between the federal government and the cantons in Switzerland, and proposes an estimation of incidences. The study of revenue-sharing formulas for the federal direct tax and the withholding tax indicates which sorts of equalization policies are pursued. Estimations of incidence per capita and administrative inefficiency are given. Regression analysis is used to estimate two coefficients of correlation between revenue-sharing per capita in the cantons, on one side, and index numbers of cantonal financial capacities and GNP per canton, on the other side. The results indicate the efficiency of equalization policies. *Schweiz. Z. Volkswirtsch. Statist.*, Mar. 1987, 123(1), pp. 71-86 (French). Universität Freiburg, Switzerland.

**Steinberg, Richard S.**—Voluntary Donations and Public Expenditures in a Federalist System

Proponents of the new federalism argue that nonprofit organizations and local governments will fully offset federal social service expenditure cutbacks. The author analyzes this proposition as a competitive game in which donations are motivated by private and public good considerations. The author characterizes the response of political-economic equilibrium to exogenous changes in federal expenditures when local voters are cognizant of donor reactions. Partial replacement is the most likely outcome, though others are possible. *Amer. Econ. Rev.*, Mar. 1987, 77(1), pp. 24-36. Virginia Polytechnic Institute and State University.

## 400 International Economics

### 410 INTERNATIONAL TRADE THEORY

#### 411 International Trade Theory

**Beladi, Hamid and Naqvi, Nadeem**—An Analysis of Wage Differentials for a Small Open Economy

In this paper the authors use the specific factor model, cast it in an intertemporal decision making framework, introduce international capital mobility, and obtain a trade model in which the endogenous saving and investment are incorporated. Since there is no insistence on the equality between saving and investment in each time period, a trade imbalance immediately arises. The authors obtain some new results regarding the implications of interindustry wage differential for the pattern and level of investment and for the balance of trade, besides demonstrating that some of the earlier results cease to be valid in the model. *Southern Econ. J.*, Jan. 1987, 53(3), pp. 605-14. Central Michigan University.

**Bhagwati, Jagdish N.; Brecher, Richard A. and Hatta, Tatsuo**—The Global Correspondence Principle: A Generalization

This paper generalizes the Global Correspondence Principle by extending, in two major ways, Samuelson's (1971) analysis of the exchange-rate response to an international purchasing-power transfer. First, the authors analyze the price effect of a shift in any parameter, not necessarily a transfer. Second, the authors explore the resulting adjustments in any non-price variable such as welfare. As the analysis shows, the direction of these adjustments depends neither on whether they are small or large nor on whether equilibrium is locally stable or unstable. Thus, the authors generalize the conventional algebra of comparative statics, which typically assumes small shifts from a stable equilibrium. *Amer. Econ. Rev.*, Mar. 1987, 77(1), pp. 124-32. Columbia University; Carleton University; Osaka University, Osaka, Japan.

**Burgstaller, André**—Unifying Ricardo's Theory of Growth and Comparative Advantage

The paper formally integrates Ricardo's two-sector growth model with his theory of compar-

ative advantage. Differences with conventional representations of Ricardian trade theory, as well as with Heckscher–Ohlin–Samuelson theory, are noted. It is shown that the Ricardian equilibrium terms of trade are fully determinate, as against the standard Millian view. Also, trade may, depending on direction of specialization, inhibit rather than promote growth and lead to a net contraction of the world economy. *Economica*, Nov. 1986, 53(212), pp. 467–81. Columbia University.

Cassing, J. H.; Hillman, A. L. and Long, N. V.—Risk Aversion, Terms of Trade, Uncertainty and Social-Consensus Trade Policy

In the Ricardo–Viner model under certainty, some specific factors are harmed by any trade tax, and mobile factors favor taxes on some—but not all—goods. This paper demonstrates in the context of the Ricardo–Viner trade model with terms-of-trade uncertainty, that in the presence of incomplete insurance markets a terms-of-trade contingent trade tax commitment can improve welfare (without any explicit income redistribution) for every factor owner. Furthermore, this result holds in both the short run, with factor specificity, and the long run before any investment decision in specificity or mobility has been implemented. *Oxford Econ. Pap.*, July 1986, 38(2), pp. 234–42. University of Pittsburgh; Bar-Ilan University and University of California, Los Angeles; Australian National University.

Dixit, Avinash—On Pareto-Improving Redistributions of Aggregate Economic Gains

This paper considers the existence and characterization of directions of tariff, commodity tax, and transfer payment reforms to ensure a Pareto improvement following a change in the economy's endowments, technology, preferences, or trading possibilities. Motzkin's Theorem on the existence of solutions to dual sets of linear inequalities is extended to the case of non-homogeneous systems and is applied to the comparative statics of the general equilibrium of a large trading economy. By allowing free disposal of commodities to the government, the problem of temporary inefficiency is eliminated. *J. Econ. Theory*, Feb. 1987, 41(1), pp. 133–53. Princeton University.

Donnenfeld, Shabtai and Mayer, Wolfgang—The Quality of Export Products and Optimal Trade Policy

This paper demonstrates that voluntary export restraints may be socially desirable to upgrade the quality of export products. When informational externalities in the recognition of quality result in suboptimal production of quality by competitive firms and the enforcement of socially desirable quality is very costly, optimal trade policy calls for export restrictions. These restrictions apply to both size and number of firms in the export industry. Export licenses combined with a specific production tax *cum* subsidy represent a suitable pair of instruments. *Int. Econ. Rev.*, Feb. 1987, 28(1), pp. 159–74. New York University; University of Cincinnati.

Galor, O. and Polemarchakis, H. M.—Intertemporal Equilibrium and the Transfer Paradox

The transfer paradox may occur in a world with only two countries at a dynamically stable intertemporal competitive equilibrium. In a framework of overlapping generations with production and investment, a transfer of income may immiserize the recipient while enriching the donor. Away from the golden rule, a transfer may result in a Pareto improvement. *Rev. Econ. Stud.*, Jan. 1987, 54(1), pp. 147–56. Brown University; Columbia University and Catholic University of Louvain.

Hartigan, James C. and Tower, Edward—The Leontief Question: A Cobb–Douglas Approach to Simulating the U.S. Income Distribution in Autarky

The question that Leontief (1956) posed in his classic article on U.S. comparative advantage is how income distribution under autarky compares with that under trade. In general, it is necessary to simulate a general equilibrium model with prohibitive tariffs to obtain the autarkic income distribution. However, the authors demonstrate that in an economy with consumer preferences and sectoral production functions, *à la* Cobb–Douglas, autarky is simulated by a simple matrix multiplication. Autarkic factor shares are then independent of factors supplies. The Leontief Paradox is reaffirmed for homogeneous capital and labor, but

disaggregation critically affects the results. *Weltwirtschaft. Arch.*, 1986, 122(4); pp. 677-89. State University of New York, Buffalo; Duke University.

**Markusen, James R.—Explaining the Volume of Trade: An Eclectic Approach**

Divide the world into a capital-abundant North and a labor-abundant South. Subdivide the North into two identical regions, East and West. Modern trade theory predicts intraindustry trade in differentiated manufactured goods between East and West, and traditional interindustry trade based on factor endowments between North and South. But the theory offers no conclusions about the volume of trade, and gives no real role to demand in determining trade flows. The model developed here explains both the volume and the direction of trade by combining nonhomothetic preferences with scale economies and differences in endowments. *Amer. Econ. Rev.*, Dec. 1986, 76(5), pp. 1002-11. University of Western Ontario.

**420 TRADE RELATIONS; COMMERCIAL POLICY;  
INTERNATIONAL ECONOMIC INTEGRATION**

**421 Trade Relations**

**Balassa, Bela—The Determinants of Intraindustry Specialisation in U.S. Trade**

This paper sets out to explain the determinants of intraindustry specialization in the United States by reference to industry as well as country characteristics. It is shown that the extent of intraindustry trade is positively correlated with product differentiation, marketing costs, the variability of profit rates, and offshore procurement; and it is negatively correlated with economies of scale, industrial concentration, foreign direct investment, and transportation costs. It is further shown that intraindustry specialization in U.S. trade with individual countries is positively correlated with the extent of trade orientation in these countries; and it is negatively correlated with inequalities in *per capita* incomes and total GNP, and with distance between the United States and the individual countries. *Oxford Econ. Pap.*, July 1986, 38(2), pp. 220-33. The World Bank and Johns Hopkins University.

**van Brabant, Jozef M.—Socialist and World Market Prices: An Ingrowth?**

This paper presents tests of the relationship between East-West trade prices and intra-Council for Mutual Economic Assistance (CMEA) prices for transferable ruble transactions for two sets of Hungarian data. A special test on the significance of the introduction of the Moscow modification of 1975 is executed where feasible. This is relevant for more than half of the commodities studied. Well-behaved relationships between world and CMEA prices are obtained for the majority of commodities, but frequently the elasticities diverge significantly from unity. This suggests that changes in average East-West trade prices are transmitted into the CMEA price formula only partly. For those products for which the relationship is statistically weak, other determinants of CMEA prices should be explored. *J. Compar. Econ.*, Mar. 1987, 11(1), pp. 21-39. United Nations.

**Culem, Claudy G.—Foreign Trade Behavior in a Small Open Economy (Belgium 1970-1980)**

Unlike imports, an infinite price elasticity of supply is not a realistic assumption for exports, especially in the short run and for a small country. This is why a simultaneous approach is developed to appraise the export behavior of the Belgian manufacturing industry during the 1970s. Both a supply and demand curve are specified and estimated simultaneously in view of the two-way relationship between price and quantity. The estimates are used to assess the stability of foreign trade, the pricing policy of exporters, and the evolution of their international market shares. *Scand. J. Econ.*, 1987, 89(1), pp. 55-70. University of Brussels.

**422 Commercial Policy**

**Bredahl, Maury E.; Schmitz, Andrew and Hillman, Jimmyle S.—Rent Seeking in International Trade: The Great Tomato War**

This paper presents a model of international rent-seeking activities by producers in both exporting and importing nations. The model is applied to the winter vegetable trade between the United States and Mexico. An analysis is made of the attempts to form export/import coalitions. Reasons for these failures are given. Due to past failures to impede trade, essentially

free trade in winter vegetables between the two countries exists. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 1-10. University of Missouri; University of California, Berkeley; University of Arizona.

**Hartigan, James C.; Perry, Philip R. and Kamma, Sreenivas**—The Value of Administered Protection: A Capital Market Approach

The focus of this paper is on the escape clause petitions filed under the Trade Act of 1974 (Section 201). First, the capital market event study method is used to analyze the effects of protection decisions. Then, cross-section regressions are performed to examine the influence of key variables on the observed market reaction. The authors conclude that while protection is beneficial to beleaguered industries, the extent of such benefits is quite narrowly circumscribed and is conditional on internal variables for each firm. Protection is thus not the panacea that its advocates claim. *Rev. Econ. Statist.*, Nov. 1986, 68(4), pp. 610-17. State University of New York, Buffalo; State University of New York, Buffalo; Indiana University.

**Ramstad, Yngve**—Free Trade versus Fair Trade: Import Barriers as a Problem of Reasonable Value

John R. Commons's theory of Reasonable Value is employed to develop a theoretical rationale for adding "the employment of labor at less than reasonable standards" to the unfair trade practices specified in the Trade Act of 1974. It is shown that "protectionism" of this type serves the public interest by extending to international trade a governing principle of intranational trade—fair trade through reasonable protection from "destructive competition." In developing the argument, Commons's theory is summarized and contrasted with the free trade position. A regulatory structure through which a fair determination of "reasonable standards" can be obtained is also identified. *J. Econ. Issues*, Mar. 1987, 21(1), pp. 5-32. University of Rhode Island.

#### 430 INTERNATIONAL FINANCE

**431 Open Economy Macroeconomics; Exchange Rates**

**Backus, David**—The Canadian-U.S. Exchange Rate: Evidence from a Vector Autoregression

A vector autoregression is used to elicit empirical facts concerning exchange rate movements. The author finds (1) the exchange rate, relative price levels, and trade balances are closely related; (2) most other lagged variables have no perceptible influence in the exchange rate equation; (3) exchange rate innovations are negatively correlated with innovations in output and prices, positively with innovations in the balance of trade, and almost not at all with innovations in money; and (4) impulses in money, trade balances, and government spending are followed by opposing future movements in the exchange rate and the price level. Taken as a whole, the evidence suggests that exchange rate changes may be associated with real, rather than monetary, shocks. *Rev. Econ. Statist.* Nov. 1986, 68(4), pp. 628-37. Queen's University.

**Bhandari, Jagdeep S. and Rahmatian Morteza**—Country Size and 'Insulation' from External Disturbances

This paper considers the relationship between economic size and vulnerability to external disturbances. In order to analyze this issue effectively a model comprising three different sized economies is constructed. The issue of economic size and insulation is approached from this alternative perspective depending upon the relative size of (1) the "recipient country" and (2) the "transmitting" country. The results of the analysis indicate that, contrary to popular belief, a small country under floating exchange rates is less severely affected by external economic events than a large economy regardless of the type of external disturbance and the degree of domestic wage indexation. *Economist*, 1986, 134(4), pp. 438-66. West Virginia University.

**Buffie, Edward F.**—Input Price Shocks in the Small Open Economy

This paper investigates the short run, macroeconomic effects of an OPEC-type price shock in a two-sector, tradables-nontradables mode with a very general treatment of production. General conditions are derived under which the impact effects of the shock will be stagflationary and the outcomes, in a variety of special cases, are examined. Surprisingly, it is found

that in many cases stag-deflationary Keynesian unemployment is to be expected. *Oxford Econ. Pap.*, Nov. 1986, 38(3), pp. 551-65. University of Pennsylvania.

**Calvo, Guillermo A.**—Balance of Payments Crises in a Cash-in-Advance Economy

The author shows that a flexible-prices, Si-drauski-type model with a cash-in-advance constraint is capable of depicting some of the phenomena associated with a balance of payments crisis, like the ones recently observed in Argentina and Mexico (current-accounts deficits, and appreciation of the real exchange rate). It is also shown that these phenomena become exacerbated as the rate of devaluation (before the crisis occurs) becomes smaller. *J. Money, Credit, Banking*, Feb. 1987, 19(1), pp. 19-32. University of Pennsylvania.

**Dornbusch, Rudiger**—Exchange Rates and Prices

The adjustment of relative prices to exchange rate movements is explained in an industrial organization approach. Given labor costs in the respective currencies, exchange rate movements change costs for firms selling in the home market and thus disturb the industry equilibrium. The extent of absolute and relative price adjustment is shown to depend on market integration, product substitutability, the relative number of domestic and foreign firms, and the market structure. The impact of exchange rates on prices is illustrated in a variety of approaches including the Cournot, A. Dixit and J. Stiglitz (1977) and S. Salop (1979) models. Some empirical evidence is offered in support of the theory. *Amer. Econ. Rev.*, Mar. 1987, 77(1), pp. 93-106. Massachusetts Institute of Technology.

**Fender, John**—Monetary and Exchange Rate Policies in an Open Macroeconomic Model with Unemployment and Rational Expectations

A two-period, two-good open economy macroeconomic model is constructed. There is excess supply of labor in each period, and agents have rational expectations about future economic variables. Money is also introduced explicitly into the analysis; agents determine their

money holdings, consumption, and savings through a process of intertemporal optimization. A number of different exchange-rate regimes are possible, and in each of these the effects of monetary and exchange-rate policies are analyzed. *Oxford Econ. Pap.*, Nov. 1986, 38(3), pp. 501-15. Pennsylvania State University.

**Frankel, Jeffrey A. and Froot, Kenneth A.**—Using Survey Data to Test Standard Propositions Regarding Exchange Rate Expectations

Survey data provide a new measure of exchange-rate expectations superior to the forward rate in that no risk premium interferes. The authors test standard propositions using three sources of survey data. The authors estimate extrapolative, adaptive, and regressive models of expectations. Static or "random walk" expectations and bandwagon expectations are rejected: variables other than the contemporaneous spot rate receive positive weight. A 10 percent appreciation of the dollar generates an expectation of future depreciation over the coming year estimated at 2 percent. In comparing expectations to the true process governing the spot rate, the authors find statistically significant bias. *Amer. Econ. Rev.*, Mar. 1987, 77(1), pp. 133-53. University of California, Berkeley; Massachusetts Institute of Technology.

**Genberg, Hans; Salemi, Michael K. and Swoboda, Alexander**—The Relative Importance of Foreign and Domestic Disturbances for Aggregate Fluctuations in the Open Economy: Switzerland, 1964-1981

This paper studies whether the advent of floating exchange rates served to insulate Switzerland from economic shocks of foreign origin. It estimates a vector autoregression comprising four Swiss and three world aggregate time series, and interprets the results in terms of the properties of the vector moving average representation implied by the estimates. The chief finding is that foreign shocks explain most of the systematic variation of the Swiss variables in both regimes. *J. Monet. Econ.*, Jan. 1987, 19(1), pp. 45-67. Graduate Institute of International Studies, Geneva; University of North Carolina; Graduate Institute of International Studies, Geneva.

**Holmes, Elhanan and Razin, Assaf—Exchange Rate Management: Intertemporal Tradeoffs**

Exchange-rate management is possible only if the government pursues consistent monetary and fiscal policies. The authors construct a model in which the real consequences of exchange-rate management depend on the precise time pattern of these policies. The authors study the constraints on feasible policies and the comparative dynamics of disinflation by means of exchange-rate targeting. Theoretical results are consistent with exchange-rate-managed disinflation attempts in Argentina, Chile, and Israel. *Amer. Econ. Rev.*, Mar. 1987, 77(1), pp. 107–23. Tel-Aviv University.

**Huang, Roger D.—Expectations of Exchange Rates and Differential Inflation Rates: Further Evidence on Purchasing Power Parity in Efficient Markets**

The paper tests the null hypothesis of *ex ante* purchasing power parity. The empirical evidence obtained is inconsistent with the null for major industrialized countries over the current floating exchange-rate regime. Expected nominal exchange rate changes appear to deviate systematically from expected inflation-rate differentials over the same holding period even though real exchange-rate changes appear to be serially uncorrelated. This supports the presence of time-varying risk premium in foreign exchange markets and real determinants of exchange-rate movements as suggested by equilibrium theories of international asset markets. *J. Finance*, Mar. 1987, 42(1), pp. 69–79. University of Florida.

**Ito, Takatoshi and Roley, V. Vance,—News from the U.S. and Japan: Which Moves the Yen/Dollar Exchange Rate?**

Intradaily movements in the yen/dollar exchange rate are examined in four nonoverlapping segments within each business day from January 1980 to September 1985. The results indicate that the dollar tended to appreciate in the New York segment and depreciate in the European segment. In three of the four subsamples considered, the Tokyo segment made virtually no contribution to annual yen/dollar rate movements. The volatility of the ex-

change rate also differed across markets. Finally, in examining the relative effects of news from the United States and Japan explicitly, U.S. money announcement surprises had the most consistent effects. *J. Monet. Econ.*, Mar. 1987, 19(2), pp. 255–77. University of Minnesota; University of Washington.

**LaCivita, Charles J.—Currency, Trade, and Capital Flows in General Equilibrium**

This paper studies currency, trade, and capital flows in a one-good general equilibrium exchange model with utility-maximizing individuals. The effects of both monetary and endowment shocks are examined. The effects of monetary shocks depend on whether the countries hold each other's currency. If so, flexible exchange rates do not insulate them from each other's monetary policy. Under deterministic monetary policies, the country with the lower monetary growth rate generates a surplus in its current account and balance of payments. If monetary policy is stochastic, capital flows are also generated. The effects of endowment shocks depend on whether equity markets exist. If so, trade, but not capital flows, are generated. If not, capital flows are also generated. *J. Bus.*, 60(1), pp. 113–35. Naval Postgraduate School, Monterey, California.

**Lamdany, Ruben and Dorlhiac, Jorge—The Dollarization of a Small Economy**

Within a utility maximizing framework, the authors study the effects of replacing the national currency with the dollar in a small, open economy. The impact effect is a drop in the levels of liquidity and wealth. The economy reaccumulates real balances by reducing consumption and showing a trade surplus. The welfare implications of the program depend on the social rate of time preference and the inflation rate differential. The authors show that the United States can improve both its own welfare and that of the small country by "bribing" it into switching currencies, and study how these results change with the introduction of capital mobility. *Scand. J. Econ.*, 1987, 89(1), pp. 91–102. Columbia University.

**Mantel, Rolf R. and Martirena Mantel, Ana M.—Acerca de las ventajas comparadas de**

sistemas de "Crawling-Peg" activo y pasivo en la economía pequeña (On the Comparative Advantage of an Active and a Passive "Crawling-Peg" Exchange Rate System for the Small Economy)

The paper studies the temporal dynamic properties of different crawling-peg exchange rate systems with the purpose of analyzing whether these alternative exchange rate rules can be sustained over time. The paper contradicts previous results reached with the PPA rule. It is shown, among several other results, that once the real sector is adjusted, the financial sector behaves exactly like the strict PPA rule, and consequently it shares its problems, multiple equilibria, lateral stability, and eventual collapse. *Económica*, May-Dec. 1985, 31(2-3), pp. 147-70 (Spanish). University of Buenos Aires.

Niehans, Jürg.—Monetary Policy and Investment Dynamics in Interdependent Economies

A dynamic two-country model is used to determine the adjustment paths of prices, interest rates, exchange rates, and capital flows after a change in monetary policy. The principal controlling factor is the reaction of investment to capital goods prices (Tobin's  $q$ ). Monetary expansion in one country produces deflationary pressure abroad. There is an instant decline in the world interest rate followed by a gradual rise. Exchange rates may overshoot or undershoot their steady-state level. The same applies to capital flows, but there is no correspondence between the paths of exchange rates and capital flows. *J. Money, Credit, Banking*, Feb. 1987, 19(1), pp. 33-45. University of Bern.

Pope, David H.—Australian Capital Inflow, Sectional Prices and the Terms of Trade: 1870-1939

The paper examines the role of "traded" and "domestic" goods prices in international capital transfers. Difficulties of measurement and conceptualization are discussed, and the causal relations between capital flows to Australia, Australia's terms of trade and "domestic prices" are investigated over the years 1870-1939 using Sargent's (1976) dynamic regression test of Granger (1969) causality. The results suggest:

that capital inflow proceeded without causing the terms of trade of the importer to change; that the ratio of "domestic" to "traded" goods prices rose, helping to effect the capital transfer; and that "domestic" prices positively feedback on capital inflow. *Australian Econ. Pap.*, June 1986, 25(46), pp. 67-82. University of New South Wales.

So, Jacky C.—The Sub-Gaussian Distribution of Currency Futures: Stable Paretian or Nonstationary?

This study conducts an empirical test to examine whether the observed non-normal distribution of currency futures price changes is generated by the relationship between maturity and variability. In general, the author finds that the relationship between maturity and variability is not sufficient to explain the observed non-normality. Although some amount of non-stationarity is present in the scale and in the characteristic exponent, the non-normal stable Paretian distribution adequately describes futures price changes for most currencies and most contracts during the period covered in this study. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 100-07. Southern Illinois University, Edwardsville.

Stockman, Alan C. and Svensson, Lars E. O.—Capital Flows, Investment, and Exchange Rates

This paper incorporates international capital flows into a two-country, monetary-general-equilibrium model of asset prices with investment and production. The authors calculate theoretical covariances between investment, the current account, the exchange rate, and the terms of trade. These covariances depend upon the coefficient of relative risk aversion, the magnitude and sign of a country's net international indebtedness, other properties of tastes and technologies, and the stochastic processes on disturbances to productivity and monetary growth rates. International capital flows arise from changes in world wealth and its relative composition in foreign and domestic assets. *J. Monet. Econ.*, Mar. 1987, 19(2), pp. 171-201. University of Rochester; University of Stockholm.

**433 International Monetary Arrangements**

**Jäger, Henk and de Jong, Eelke**—The Perspective of the SDR's Position in Monetary Reserves: On the Robustness of Optimal Portfolio Results

To gain an empirical impression of the Special Drawing Right's attractiveness as a reserve asset, an amended mean variance analysis is applied to official reserves. The main amendments bear upon the choice of the numéraire and the rejection of both the capital market line and the effective yield's positive marginal utility—frequently assumed in empirical analysis. Comparison of the outcome with that recently obtained by A. Ben-Bassat (1984) shows a large sensitivity of optimal portfolio results for slight differences in assumption. A second, substantial kind of sensitivity of an asset's position in a portfolio appears to ensue from the influence of other competing functions of reserves. *De Economist*, 1986, 134(4), pp. 417–37. University of Amsterdam.

**Swanson, Peggy E.**—A Preliminary Assessment of the Impact of Floating Exchange Rates on International and Vehicle Currency Uses of U.S. Dollars

This paper attempts to determine if the international and vehicle currency roles of the U.S. dollar were affected significantly when the United States adopted floating exchange rates in 1973. Thus, the role of dollar transactions in foreigners' demand for U.S. dollars during a period of fixed exchange rates (1965I–1973I) is compared to demand during a period of floating exchange rates (1973II–1983IV). Evidence exists that international and vehicle dollar usage did decrease when exchange rate regimes changed, but the changes are not significant unless dollar balances held in the United States are included in foreigners' holdings. *Quart. J. Bus. Econ.*, Spring 1987, 26(2), pp. 3–21. University of Texas at Arlington.

**433 Private International Lending**

**Jain, Arvind K. and Gupta, Satyadev**—Some Evidence on "Herding" Behavior by U.S. Banks

The authors examine the international lending decisions of U.S. commercial banks of different sizes from 1977 to 1982 for evidence of the

existence of "herding" behavior. Granger-Sims causality tests for the loans granted by the top nine, the next fifteen, and the remaining U.S. banks provide no clear evidence of herding between the top nine and the next fifteen banks. There is, however, evidence that the remaining banks (mostly small ones) herded behind the top twenty-four banks. Overall, the analysis presented here points to a very weak herding behavior. *J. Money, Credit, Banking*, Feb. 1987, 19(1), pp. 78–89. McGill University; St. Thomas University.

**440 INTERNATIONAL INVESTMENT AND FOREIGN AID**

**441 International Investment and Long-term Capital Movements**

**Chen, Tain-Jy**—Alternative Policies for Foreign Investment in the Presence of Tariff Distortions

This paper examines two alternative policies for a small, tariff-distorted country hosting foreign investment. One policy is to allow foreign firms to operate behind the tariff wall; the other is to confine them in a free-trade area. Using a specific factor model, the author shows that confining foreign firms in a free-trade area is superior. Furthermore, under that setting, a subsidy to foreign firms on the use of capital is an optimal policy if they can be prevented from paying domestic workers with their own products. *Australian Econ. Pap.*, Dec. 1985, 24(45), pp. 394–403. University of Mississippi.

**442 International Business**

**Batra, Raveendra N.**—A General Equilibrium Model of Multinational Corporations in Developing Countries

Using a two-sector model of international trade that incorporates the behavior of multinational corporations in developing economies, this paper shows that if the multinational corporations (MNCs) transfer only technology, but no capital, then employment and national income decline in the developing country. Only if the technology transfer is accompanied with substantial transfer of capital, do the MNCs benefit a developing economy. Therefore, the MNCs should be encouraged to provide both technology and capital to a labor-surplus country. *Oxford Econ. Pap.*, July 1986, 38(2), pp. 342–53. Southern Methodist University.

**Dunning, John H.—The Investment Development Cycle Revisited**

This article seeks to explain the propensity of developing countries to engage in outward direct investment. Contrary to first world multinational enterprises (MNEs), those from the third world are mainly concerned with exploiting individual and unique asset advantages. Since the latter are likely to reflect country specific characters, it follows that the patterns of overseas investment by third world MNEs is more nearly explainable by a factor endowment model. Moreover, as yet only a few third world MNEs operate integrated strategies; this is usually reserved to a later stage of the development cycle. *Weltwirtsch. Arch.*, 1986, 122(4), pp. 667–76. University of Reading.

**Horstmann, Ignatius J. and Markusen, James R.—Strategic Investments and the Development of Multinationals**

A model of multinational behavior is presented in which either the existence or absence of multinationals can be a Nash equilibrium outcome. The key determinant is the relationship between plant scale economies (a force for geographic centralization) and multiplant economies plus transport costs (leading to multinationality). The model predicts that multinational enterprise production arises when firm-specific and transportation costs are large relative to plant scale economies. The latter are both a technological and a strategic variable in the entry decision. *Int. Econ. Rev.*, Feb. 1987, 28(1), pp. 109–21. University of Western Ontario.

**Barzel, Yoram—The Entrepreneur's Reward for Self-policing**

Collaboration among people is often subject to shirking; the net gain from collaboration depends on the contract governing it. The author argues that the entrepreneur assumes the role of residual claimant because his actions are more costly to monitor than those of the factors

with which he collaborates. By offering fixed pay contracts to others and becoming residual claimant, the entrepreneur curtails his incentive to gain at his partners' expense, and the net gain from collaboration is then maximized. Costly monitoring applies to both labor and capital, and thus the entrepreneur may supply both. The entrepreneur's capital serves to guarantee the pay of the other factors. *Econ. Inquiry*, Jan. 1987, 25(1), pp. 103–16. University of Washington.

**520 BUSINESS FINANCE AND INVESTMENT**

**521 Business Finance**

**Bar-Yosef, Sasson; Callen, Jeffrey L. and Livnat, Joshua—Autoregressive Modeling of Earnings-Investment Causality**

The purpose of this paper is to empirically test the relationships between corporate earnings and investment. In particular, the study investigates whether knowledge of past investments improves the prediction of future earnings beyond predictions that are based on past earnings alone. Similarly, it investigates whether knowledge of past earnings improve the prediction of future investments beyond knowledge of past investments alone. This is the empirical definition of Granger causality. The empirical results show that the bivariate past series of earnings and investments is superior to the univariate series in predicting future investment, but not in predicting future earnings. *J. Finance*, Mar. 1987, 42(1), pp. 11–28. Hebrew University; Hebrew University and McMaster University; Hebrew University and Vanderbilt University.

**Connolly, Robert A.; Hirsch, Barry T. and Hirschey, Mark—Union Rent Seeking, Intangible Capital, and Market Value of the Firm**

This study considers the effect of unions on intangible capital investment and profitability within the context of market value rather than a more traditional accounting-based approach. Theory is provided suggesting unions are able to affect profitability by sharing in the economic returns to firm-specific intangible capital. In support of this hypothesis, we find unionization reduces the returns to R&D and produces a corresponding limiting influence on R&D in-

vestment at the firm level. *Rev. Econ. Statist.*, Nov. 1986, 68(4), pp. 567-77. University of California, Irvine; University of North Carolina, Greensboro; University of Colorado, Denver.

**Fons, Jerome S.—The Default Premium and Corporate Bond Experience**

By incorporating previous work on the default experience of low-rated corporate debt, this paper presents an introduction to risk-neutral models of risky bond pricing and uses these to examine the relationship between the default premium embodied in bond yields and actual default rates. The contribution of macroeconomic information to the default premium is also examined. The authors find that holders of low-grade bonds have, on average, been compensated for losses due to default. *J. Finance*, Mar. 1987, 42(1), pp. 81-97. Federal Reserve Bank of Cleveland.

**Marsh, Terry A. and Merton Robert C.—Dividend Behavior for the Aggregate Stock Market**

The authors develop and estimate a model of the dynamic behavior of aggregate corporate dividends as a function of the change in permanent earnings of firms. Although structured along the lines of J. Lintner's (1956), J. Brittain's (1966), and E. F. Fama and H. Babiak's (1968) models of individual firm dividend behavior, the model uses changes in stock prices instead of accounting earnings to measure permanent-earnings changes. The performance of the model is compared with both the accounting earnings-based models and the trend-autoregressive model associated with R. J. Shiller (1981). *J. Bus.*, Jan. 1987, 60(1), pp. 1-40. University of California, Berkeley and Stanford University; Massachusetts Institute of Technology.

**Williams, Joseph T.—Perquisites, Risk, and Capital Structure**

In a corporate agency problem, perquisites and risk interact to produce novel, complex comparative statics. For example, even if additional debt induces risk-neutral insiders to increase risk, they never seek to increase the market value of their stock; instead, insiders decrease the present value of their subsequent, conditionally optimal perquisites. Also, the

firm's optimal capital structure includes a risky bond with an agreement to remove insiders whenever the bond defaults. However, the optimal sharing rule between corporate claimants cannot be supported solely by standard securities like bonds, stock, options, and their hybrids. *J. Finance*, Mar. 1987, 42(1), pp. 29-48. New York University.

**522 Business Investment**

**Chirinko, Robert S.—Tobin's *Q* and Financial Policy**

Recent research in macroeconomics has emphasized the importance of linking the financial and real sectors and working with optimizing models. Tobin's *Q* model of investment would appear to provide a framework satisfying these two criteria. In contrast to the original presentation of the *Q* model, the formal development has not recognized that the firm actively participates in a number of financial markets; in this broader context, *Q* may be an uninformative and possibly misleading signal for investment expenditures. The author then endeavors to turn this negative theoretical result to positive advantage in resolving a number of empirical problems with *Q* models. *J. Monet. Econ.*, Jan. 1987, 19(1), pp. 69-87. University of Chicago and National Bureau of Economic Research.

**610 Industrial Organization and Public Policy**

**Masten, Scott E.—Institutional Choice and the Organization of Production: The Make-or-Buy Decision**

This paper provides a simple model which treats the firm's make-or-buy decision as part of a producer's overall optimization problem. Comparative static results offer support for several contentions advanced in the transaction-cost literature. More importantly, the model permits investigation of a number of interactions and relationships not readily amenable to verbal analysis. In particular, the effects of asset specificity and uncertainty on optimal contract length are examined, and a tendency to underinvest in transaction-specific assets under external procurement is demonstrated. *J. Inst. Theo-*

*Acad Econ.*, Sept. 1986, 142(3), pp. 493-509. University of Michigan.

**Market Structure: Industrial Organization and Corporate Strategy**

**Chattacharya, Sudipto; Chatterjee, Kalyan and Samuelson, Larry**—Sequential Research and the Adoption of Innovations

The authors examine a firm able to adopt an innovation of uncertain profitability; reject an innovation; or delay deciding in order to acquire information on profitability. Deriving an optimal strategy from established sequential sampling literature, the authors construct a theory of the diffusion of innovation. Firms are assumed to hold identical prior expectations of an innovation's profitability, and to conduct privately observed experiments on its profitability. The naturally arising distribution of experimental results yields a distribution of adoption times exhibiting established facts on innovation diffusion. Finally the authors examine the implications of strategic interactions between firms, where this affects both the learning process and the results of adoption. *Oxford Econ. Pap.*, pp. Nov. 1986, 38, pp. 219-43. University of California, Berkeley; Pennsylvania State University; Pennsylvania State University.

**Hander, James A. and Lewis, Tracy R.**—Oligopoly and Financial Structure: The Limited Liability Effect

The authors argue that product market decisions and financial structure will normally be related. Assuming an oligopoly structure in which financial decisions and output decisions flow in sequence, it is shown that limited liability may commit a leveraged firm to a more aggressive output stance, expanding its market area and profit at the expense of a fully equity-financed rival. Firms will therefore have incentives to use financial structure to influence the product market, leading, normally, to an interlocking solution for the debt equity ratio even in the absence of bankruptcy costs and tax advantages of debt. *Amer. Econ. Rev.*, Dec. 1986, 76(5), pp. 956-70. University of British Columbia.

**Handman, Lance; Klein, J. Douglass and Weiss, Leonard W.**—The Price Effects of Increased Competition in Auction Markets

Bidding theory predicts lower selling winning bids (higher buying winning bids) as numbers of bidders increase. Alternative versions predict that winning bids fall (rise) with the second order statistic, the maximum order statistic, or  $1/N$ . The authors test these predictions using data on underwriters' spreads on tax exempt bonds, offshore oil tracts, and National Forest timber. They estimate winning bids using general variables for the product and dummies for 1, 2, . . . 11 bidders. In all cases more bidders mean significantly lower (selling) winning bids. The expected maximum order statistic fits better than either the second order statistic or  $1/N$ , in ten out of twelve cases. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 24-32. University of Wisconsin, Milwaukee; Union College, Schenectady; University of Wisconsin, Madison.

**Eaton, Jonathan and Grossman, Gene M.**—The Provision of Information as Marketing Strategy

The authors study the disclosure of information about product characteristics as part of firms' competitive strategy. A model of a differentiated products duopoly is constructed in which firms may choose whether or not to reveal the attributes of their product to consumers with heterogeneous tastes. The authors analyze the implications of disclosure versus nondisclosure for firms' profits and consumer welfare, and identify the Nash equilibrium marketing strategies corresponding to different competitive conditions. They also consider an expanded game in which firms initially select their product types. *Oxford Econ. Pap.*, Supp. Nov. 1986, 38, pp. 166-83. University of Virginia; Princeton University.

**Ghemawat, Pankaj and Caves, Richard E.**—Capital Commitment and Profitability: An Empirical Investigation

Opportunities to precommit costs can either increase the rents of incumbent firms (by deterring entry), or decrease them (through commitment races and lapses into noncooperation). Authors seek to discriminate statistically between these predictions in the determinants of profits of businesses in a cross-section of concentrated markets for producer nondurables. Overall, a business's profitability declines with its industry's scope for precommitting production capacity (sunk costs). However, variables interacted

with the scope for commitment do not point clearly toward one or the other mechanism. Therefore, commitment opportunities seem likely to lead to deterrence and noncooperative rivalry in proportions that differ idiosyncratically among markets. *Oxford Econ. Pap.*, Supp. Nov. 1986, 38, pp. 94-110. Harvard University.

**Hansen, Robert G.**—A Theory for the Choice of Exchange Medium in Mergers and Acquisitions

This paper presents a theory for the choice of exchange medium in mergers and acquisitions. The model used is one of bargaining under asymmetric information. When a target firm knows its value better than a potential acquirer, the acquirer will prefer to offer stock, which has desirable contingent-pricing characteristics, rather than cash. Either tax effects or asymmetric information on the acquiring side can make the acquirer's choice a nontrivial one. With asymmetry on both sides of the transaction, a signaling equilibrium develops whereby the target uses both exchange medium offered and the amount of any stock offer as signals of the acquiring firm's value. Several testable implications emerge for when stock trades will be observed, and some mildly supportive evidence is presented. *J. Bus.*, Jan. 1987, 60(1), pp. 75-85. Dartmouth College.

**Joskow, Paul L.**—Contract Duration and Relationship-Specific Investments: Empirical Evidence From Coal Markets

This paper examines empirically the importance of relationship investments in determining the duration of coal contracts negotiated between coal suppliers and electric utilities, using data for 277 coal contracts. For each contract, measures of the duration of contractual commitments agreed to by the parties at the contract execution stage and measures of the importance of relationship specific investments are developed. The results provide strong support for the view that buyers and sellers make longer commitments to the terms of future trade at the contract execution stage, and rely less on repeated bargaining, when relationship-specific investments are more important. *Amer. Econ. Rev.*, Mar. 1987, 77(2), pp. 168-85. Massachusetts Institute of Technology.

**Katz, Michael L. and Shapiro, Carl**—Product Compatibility Choice in a Market with Technological Progress

In markets where advantages, e.g., network externalities, are significant, firms' product compatibility choices are an important determinant of industry performance. This paper compares the private and social incentives to achieve compatibility in a two-period duopoly model with (possible stochastic) technological progress. Earlier analysis using static models found that the social incentives to achieve industrywide compatibility always exceed the private incentives. Here the authors find that private firms may have socially excessive compatibility incentives because compatibility serves as a means of relaxing price competition during early stages of industry growth. *Oxford Econ. Pap.*, Supp. Nov. 1986, 38, pp. 146-65. Princeton University.

**Leech, Dennis**—Ownership Concentration and the Theory of the Firm: A Simple-Game-Theoretic Approach

A model of the shareholder constraint is described in terms of the relationship between shareholding concentration and corporate control. A unified perspective (including takeovers as a special case) is developed whereby leading coalitions are costly to form and possess power in a shareholder voting game. Control is defined in terms of power indices for simple games. A static theory of the firm is developed in terms of the optimal formation of controlling coalitions. A dynamic theory of an owner-controlled firm is described which explains increasing shareholding dispersion accompanying growth. *J. Ind. Econ.*, Mar. 1987, 35(3), pp. 225-40. University of Warwick, Coventry, England.

**Odagiri, Hiroyuki and Yamashita, Takashi**—Price Mark-Ups, Market Structure, and Business Fluctuation in Japanese Manufacturing Industries

Howard Wachtel and Peter Adelsheim (1977) and Keith Cowling (1983) have argued that firms in concentrated industries tend to increase their price mark-ups in recession. This hypothesis is variously tested for Japanese manufacturing industries in 1958-82. Most of the results weakly suggest an effect opposite to

Wachtel and Adelsheim and only when industry-specific business conditions are taken into account, is some, albeit weak, evidence found in favor of them. *J. Ind. Econ.*, Mar. 1987, 35(3), pp. 317-31. University of Tsukuba, Ibaraki, Japan; Tokyo Electric Power Co., Tokyo.

**Perloff, Jeffrey M. and Salop, Steven C.**—Firm-Specific Information, Product Differentiation and Industry Equilibrium

Where consumers have imperfect information about specific firms' prices and lack information about the market, firms have informational market power. In general, improving the consumers' information about each firm's price will not necessarily lower the average market price. The authors show however that certain types of improvements will lower price. Moreover a reduction in barriers to entry (e.g., capital costs) will lower price, holding information constant. Where a significant number (but not all), consumers have perfect information, single-price equilibria are impossible. *Oxford Econ. Pap.*, Supp. Nov. 1986, 38, pp. 184-202. University of California, Berkeley; Georgetown University Law Centre.

**Powell, Irene**—The Effect of Reductions in Concentration on Income Distribution

The simulation model of this study indicates that a decline in above normal profits associated with concentration will cause a redistribution of income from the highest of six income classes to low and middle income classes. The magnitude of gains and losses range from 0.2 to 0.9 percent of income for reductions in four-firm concentration ratios to 50 percent in all manufacturing industries. The methodology uses consumer expenditure data and input-output information to estimate the impact on payments made to capital, and uses income tax data on income sources by income class to estimate the impact on income received from capital ownership. Estimates of the change in profits resulting from a change in concentration are based on a published concentration-profits regression. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 75-82. Mount Holyoke College.

**Yamawaki, Hideki**—Exports, Foreign Market Structure, and Profitability in Japanese and U.S. Manufacturing

This paper examines the influence of price decisions by foreign firms on export price decisions by domestic firms. The theoretical analysis develops a general model which hypothesizes a positive relation between export price and foreign price assuming international product differentiation. This model further suggests that export price depends on foreign structural traits as they determine foreign price. The empirical analysis, based on a cross-section of sixty-nine four-digit manufacturing industries matched between the United States and Japan, provided support for the hypothesis that foreign market structure and foreign pricing affect export pricing and thus the observed price-cost margin. *Rev. Econ. Statist.*, Nov. 1986, 68(4), pp. 618-27. International Institute of Management, Berlin.

**612 Public Policy toward Monopoly and Competition**

**Adams, Walter and Brock, James W.**—Corporate Size and the Bailout Factor

An unequivocal advantage of large corporate size is found to be the unique capacity of giant firms to obtain government bailouts. Nor are big firm bailouts limited solely to obvious, explicit government financial rescues (like Chrysler). In addition, they are found to occur in a variety of indirect—but equally important—ways. These are examined, and supporting evidence is adduced. Some implications of these findings are discussed, including doubts about the wisdom of recent efforts to weaken the nation's structural antitrust policies, especially as regards mega-mergers and the bigness complexes created in their wake. *J. Econ. Issues*, Mar. 1987, 21(1), pp. 61-85. Michigan State University; Miami University, Oxford, Ohio.

**Rosenbaum, David L.**—Predatory Pricing and the Reconstituted Lemon Juice Industry

Current antitrust doctrine seemingly accepts average variable cost as one possible boundary between competitive and predatory pricing. Certain authors contend, however, that equally efficient rivals can sometimes be excluded from a market even when a dominant firm prices above its own average variable cost. This is particularly true in industries where product differ-

entiation is important. A model is developed to test for this type of predatory conduct. The model is applied to the reconstituted lemon juice industry. It is shown that under certain conditions, even prices above average variable cost can be exclusionary. *J. Econ. Issues*, Mar. 1987, 21(1), pp. 237-58. University of Nebraska.

### 613 Regulation of Public Utilities

**Roberts, Mark J.**—Economies of Density and Size in the Production and Delivery of Electric Power

Three measures of economies of density and size are developed to analyze the cost structure of firms which deliver a product to a geographically dispersed group of customers. The measures arise because output expansions due to increased demands by existing customers, demands by new customers in the service area, or an expansion of the service area can each have a different impact on ray average cost. In the case of electric power supply, the important source of declining ray average cost is an increase in consumption per customer and not an increase in the customer density or size of the firm's service area. *Land Econ.*, Nov. 1986, 62(4), pp. 378-87. Pennsylvania State University.

### 615 Economics of Transportation

**Bayliss, Brian T.**—Structure of the Road Haulage Industry in the United Kingdom, and Optimum Scale

The study analyzes the change in the structure of the road haulage industry in the United Kingdom since the early 1930s. It concludes that the size of the common carrier operator has increased over the period, but this is concealed in official statistics through the inclusion of restricted license operators. Industry growth and cost models are developed, and it is argued that regulation has prevented road haulage operators from achieving a minimum efficient scale. Comparisons with other countries suggest that operators in these countries have been more severely impeded in relation to the realization of a minimum efficient scale. *J. Transp. Econ. Policy*, May 1986, 20(2), pp. 153-72. University of Bath.

**Beesley, Michael E.**—Commitment, Sunk Costs, and Entry to the Airline Industry: Reflections on Experience

The theory of contestable markets suggests that, given completely free entry into the market, the exploitation of natural monopoly situations is limited by the costs not of entry but of exit. The magnitude of sunk costs is thus crucial in determining the need for regulatory protection. Air transport has been cited as a highly contestable market because of the mobility and versatility of the capital equipment used. This paper is a case study of an attempted entry into the international air market, identifying the nature and magnitude of the sunk costs involved and the extent to which these costs arise from the nature of the regulatory process itself rather than from the inherent characteristics of the business. *J. Transp. Econ. Policy*, May 1986, 20(2), pp. 173-90. London Graduate School of Business Studies.

**Davies, J. E.**—Competition, Contestability and the Liner Shipping Industry

This paper demonstrates that the international liner shipping industry can be appropriately described as highly contestable. It is shown that sunk costs are very low, entrants and incumbents are symmetrically placed, and the price sustainability condition is satisfied. Empirically, Canadian data show frequent entry and exit, hit and run entry, and large scale entry. Thus far from being a theory without facts, the contestability principle is shown to be extremely relevant in the economic analysis of the ocean shipping industry. *J. Transp. Econ. Policy*, Sept. 1986, 20(3), pp. 299-312. Acadia University, Wolfville, Canada.

**Evans, Andrew**—A Theoretical Comparison of Competition with Other Economic Regimes for Bus Services

This paper uses a theoretical model to compare the economics of bus services operated under four different regimes: competition, maximization of net economic benefit (subject to the constraint that the service must break even), unregulated monopoly, and unconstrained maximization of net economic benefit. A time segment from an infinitely-long day, and a bus route with a finite time cycle of 60

minutes are considered separately. The analogy between spatial competition, such as that between shops, and temporal competition between buses is used. Ideas from spatial competition are coupled with the exponential demand model drawn from public transport. *J. Transp. Econ. Policy*, Jan. 1987, 21(1), pp. 7-36. University of Bristol.

**Hayashi, Paul M. and Trapani, John M.—The Impact of Energy Costs on Domestic Airline Passenger Travel**

This paper examines the role of energy costs in determining fare levels and the quality of service provided by airline carriers. This research is important to our understanding of how fuel cost changes may impact capacity provided to airline markets, and to our assessment of the consequences of deregulation of the airline industry during an unprecedented period of rising energy costs. The authors find that rising aviation fuel costs will reduce capacity supplied in city-pair markets and thereby reduce passenger demand, other things the same. Independently, rising ground travel costs induce greater passenger demand. The overall effect of increased energy cost of the magnitude experienced between 1971-1979 is simulated for a competitive airline market. The authors find that the typical city-pair market will have lower capacity, reduced passenger demand, and higher load factors. This capacity reduction has often been attributed to deregulation when, in fact, it is the result of higher fuel cost facing airline carriers. *J. Transp. Econ. Policy*, Jan. 1987, 21(1), pp. 73-86. University of Texas, Arlington.

**Joy, Stewart—Contestable Market Analysis in the Australian Domestic Airline Industry**

William Baumol's contestability analysis is presently being applied to the Australian domestic airline industry, with its long-standing, government-imposed "two airline" policy. In the absence of real-time experimentation, the behavior of the chosen two airlines in the past, and particularly the way in which they have organized regional services into separate corporate entities, gives powerful leads as to the airlines' private views of the diseconomies of scale and scope in airline operation. The structure

of airline markets and niches is discussed, and it is concluded that the more airlines, the greater the total airline passenger market, and that as soon as a second carrier is introduced, there is no case for limiting the number of participants. *J. Transp. Econ. Policy*, May 1986, 20(2), pp. 245-54. Australian Ministry of Transport, Melbourne.

**Kirby, Michael G.—Airline Economies of "Scale" and Australian Domestic Air Transport Policy**

A conceptual framework for considering scale economies is developed which more effectively utilizes all the available information on the multiproduct nature of airline activities. The estimated cost model reveals substantial economies of operation with respect to load factors, aircraft size, and stage length, but diseconomies associated with serving more ports and increased departures from a given port. Simulation of various policy alternatives indicates the existence of substantial potential cost savings in the Australian domestic airline industry. *J. Transp. Econ. Policy*, Sept. 1986, 20(3), pp. 339-52. Australian Bureau of Agricultural Economics, Canberra.

**Kolsen, H. M.—Transport Policy in Australia: The Role of the Inter-State Commission**

This article examines the extent to which transport economics is able to influence transport policy given the existence of historical, institutional, constitutional, and political constraints which differ considerably between countries. The Australian Federation has some unique features, which include provisions in the Australian Constitution for the establishment of an Inter-State Commission. After discussion of the initial reasons for this, the re-establishment of the Commission in 1984 and its activities are examined in the context of transport policy in the Australian Federation. *J. Transp. Econ. Policy*, May 1986, 20(2), pp. 275-82. University of Queensland, Australia.

**Mackie, Peter J. and Simon, David—Do Road Projects Benefit Industry? A Case Study of the Humber Bridge**

A prime justification for the roads program is to improve industrial competitiveness by re-

ducing transport costs, yet little empirical work has been done to examine this linkage. This is because roads tends to be improved incrementally except where estuaries are crossed. A case study of fifty-two regular commercial users of the new Humber Bridge demonstrates that operators adjusted by increasing vehicle use, increasing market penetration, changing market areas served, and by internal rationalization. Labor time savings could generally be productively used so that, in this case, the "cost saving" approach to valuing working time savings is not unreasonable. *J. Transp. Econ. Policy*, Sept. 1986, 20(3), pp. 377-84. University of Leeds.

**Menashe, Eliahu and Guttman, Joel M.**—Uncertainty, Continuous Modal Split, and the Value of Travel Time in Israel

This paper develops a car-bus modal split model for an Israeli sample, which differs from most previous modal split models in two respects: (1) the uncertainty of commuters regarding the difference in time cost between the two modes is taken into account, and (2) the dependent variable is continuous rather than dichotomous. The results suggest that uncertainty is indeed an important element in modal choice and that continuous modal split models can achieve higher levels of statistical explanation than binomial or multinomial models. *J. Transp. Econ. Policy*, Sept. 1986, 20(3), pp. 369-75. University of Houston; Bar-Ilan University, Israel.

**Sharp, Clifford; Button, Kenneth and Deadman, Derek**—The Economics of Tolled Road Crossings

This paper examines the nature and problems of tolling crossings in the United States and the United Kingdom. It outlines the basic economic theory upon which tolls could be based and considers the divergence of current practices from this theory. It pays particular attention to the difference in approach adopted by the central authorities of the two countries and examines reasons for these differences and the implications for the pursuit of an efficient transport policy. Some estimates are provided of the long-term debt problems, which are likely to be encountered on certain crossings in the U.K.

if current policies are continued. *J. Transp. Econ. Policy*, May 1986, 20(2), pp. 255-74. University of Leicester.

**Teal, Roger F. and Berglund, Mary**—The Impact of Taxicab Deregulation in the USA

Many economists have contended that deregulation of the urban taxicab industry would result in benefits to consumers in the form of lower prices, improved service, and a wider variety of price-service options. Several large U.S. cities have deregulated their taxi industries, but in both telephone order and cabstand markets the empirical results have not been consistent with prior theoretical expectations. This paper analyzes the results of taxi deregulation in these U.S. cities and offers explanations, based on industrial organization concepts, of why this policy has largely failed to produce benefits for either consumers or providers. *J. Transp. Econ. Policy*, Jan. 1987, 21(1), pp. 37-56. University of California, Irvine.

#### 616 Industrial Policy

**Tomer, John F.**—Developing Organizational Comparative Advantage via Industrial Policy

Cooperative interorganizational relationships such as those between business and government are very important to a nation's productivity. The benefits of cooperation between organization become clear when ideal cooperative situations are contrasted with a range of less cooperative ones using the Prisoner's Dilemma game and externalities analysis. The final section examines the implications for the organizational dimension of an industrial policy. The purpose of an organizational policy is to bring the behavior of organizations closer to the ideal and, therefore, to achieve an organizational comparative advantage for the nation. Conventional economic policies or regulation are found lacking in this respect. *J. Post Keynesian Econ.*, Spring 1987, 9(3), pp. 455-72. Manhattan College.

#### 619 Economics of Regulation

**Glaister, Stephen**—Regulation through Output Related Profits Tax

Prospects are discussed for regulating a multiproduct, monopolistic enterprise through a tax on profit at a rate variable with output. Selec-

tion of weights when defining output could induce outcomes ranging from Ramsey pricing to any desired pattern of cross subsidy. The telecommunications industry is used to illustrate. If quality depends upon output (as in public transport) socially optimal pricing would be induced. The scheme has the advantage of limiting detailed intervention and preserving the profit motive. However, unrealistic assumptions are necessary and implementation would require a great deal of information. This limits its practical value. *J. Ind. Econ.*, Mar. 1987, 35(3), pp. 281-96. London School of Economics.

**Lee, Wayne Y. and Thakor, Anjan V.**—Regulatory Pricing and Capital Investment with Asymmetric Information about Cost

The paper discusses how regulators, *a priori* uninformed about a monopolistic firm's variable cost, should set output price for the firm. The regulator's objective is to maximize weighted average of consumer and producer surplus. It shows that the informational asymmetry between the regulator and the firm can be effectively resolved by making price a function of the firm's level of capital investment. The properties of this price schedule and its implications for the firm's investment decision are explicitly characterized. It shows that if a firm has higher variable cost, it invests less capital, is awarded a higher price, and enjoys lower profit. *Southern Econ. J.*, Jan. 1987, 53(3), pp. 720-34. Santa Clara University; Indiana University.

#### 620 ECONOMICS OF TECHNOLOGICAL CHANGE

**621 Technological Change; Innovation; Research and Development**

**Beath, John; Katsoulacos, Yannis and Ulph, David**—Sequential Product Innovation and Industry Evolution

A certain sequence of innovations in a vertically differentiated good is considered. Two firms are engaged in a series of bidding games to acquire the (infinitely-lived) patents to these. Managerial diseconomies restrict firms to producing a single good which is chosen optimally from the set of patents owned by the firm. Product market equilibrium is Bertrand. Two theorems provide (1) a sufficient condition for the current leader to be overthrown (action-reac-

tion) and (2) a necessary and sufficient condition for persistent dominance. An illustrative example shows that sequences satisfying these conditions can always be constructed. *Econ. J.*, Supp. 1987, 97, pp. 32-43. University of Bristol; University of Liverpool; University of Bristol.

**Farrell, Joseph and Saloner, Garth**—Installed Base and Compatibility: Innovation, Product Preannouncements, and Predation

A good is often more valuable to any user, the more others use compatible goods. The authors show that this effect may inhibit innovation. If an installed base exists and transition to a new standard must be gradual, early adopters bear a disproportionate share of transient incompatibility costs. This can produce "excess inertia." The installed base, however, is "stranded" if the new standard is adopted: this may create "excess momentum." These dynamic effects have strategic implications. Temporary price cutting can permanently prevent entry; and product preannouncements can be critical in innovation. These strategic actions have ambiguous welfare effects. *Amer. Econ. Rev.*, Dec. 1986, 76(5), pp. 940-55. GTE Laboratories, Waltham, Massachusetts; Massachusetts Institute of Technology.

**Ireland, N. and Stoneman, P.**—Technological Diffusion, Expectations and Welfare

This paper investigates a simple intertemporal model to illustrate the effect of different forms of expectations formation by the buyers of technology on the extent and time path of the usage of a new technology. In addition, the related questions of the optimal rate of take up of new technology, and the design of policies to achieve such a rate, are considered. *Oxford Econ. Pap.*, July 1986, 38(2), pp. 283-304. University of Warwick.

**Jaffe, Adam B.**—Technological Opportunity and Spillovers of R&D: Evidence from Firms' Patents, Profits, and Market Value

This paper quantifies the effects of exogenous variations in the state of technology (technological opportunity) and of the R&D of other firms (spillovers of R&D) on the productivity of firms' R&D. The R&D productivity is increased by the R&D of "technological neighbors," though

neighbors' R&D lowers the profits and market value of low-R&D-intensity firms. Firms are shown to adjust the technological composition of their R&D in response to technological opportunity. *Amer. Econ. Rev.*, Dec. 1986, 76(5), pp. 984-1001. Harvard University.

Levin, Sharon G.; Levin, Stanford L. and Meisel, John B.—A Dynamic Analysis of the Adoption of a New Technology: The Case of Optical Scanners

Two proportional hazard models are used to investigate the differing effects of market structure variables on the conditional probability of a firm initially adopting the new technology of optical scanners as the innovation spreads through the food store industry. During the early stage, leading firms with large average store size which are not members of chains and which operate in less concentrated markets with higher incomes and wage rates, tend to adopt scanners sooner. Later on, differences in seller concentration, market share, and size become less important as other firms follow prior adoptions. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 12-17. University of Missouri, St. Louis; Southern Illinois University, Edwardsville; Southern Illinois University, Edwardsville.

Pavitt, Keith; Robson, Michael and Townsend, Joe—The Size Distribution of Innovating Firms in the UK, 1945-1983

A survey of 4,378 significant innovations shows that firms with fewer than 1,000 employees commercialized a much larger share than is indicated by their share of R and D expenditures. Innovations per employee have been consistently above average in firms with more than 10,000 employees, and have become so in firms with fewer than 1,000. Intersectoral variation in the size distribution of innovating firms can be explained as a function of R and D-based technological opportunities, and of "technological ease of entry" by user firms with principal activities outside the sector. *J. Ind. Econ.*, Mar. 1987, 35(3), pp. 297-316. University of Sussex.

Wozniak, Gregory D.—Human Capital, Information, and the Early Adoption of New Technology

When producers are uncertain or have imperfect information about the profitability of adopting new technology, their adoption behavior depends on the endowment of human capital and the investment in adoption information. This study analyzes the role of education, experience, and information acquisition in the decision to be an early adopter. The findings support the thesis that adoption decision making is a human capital intensive activity. The econometric evidence presented suggests that education and information reduce adoption costs and uncertainty, and thereby raise the profitability of early adoption. Adoption behavior is also shown to vary significantly across firm size. *J. Human Res.*, Winter 1987, 22(1), pp. 101-12. University of Tulsa.

### 630 INDUSTRY STUDIES

#### 631 Industry Studies: Manufacturing

Akridge, Jay T. and Hertel, Thomas W.—Multiproduct Cost Relationships for Retail Fertilizer Plants

Retail fertilizer plants produce a number of products and services. To analyze the relationship between cost and output for these multiproduct firms, a short-run translog cost function is estimated using pooled data. Measures of economies of scope and scale are calculated. Results indicate plants can lower average cost by increasing output and by diversifying into anhydrous ammonia. Furthermore, preliminary evidence indicates that firms in the sample are overinvested in plant and equipment. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 928-38. Purdue University.

Daly, Michael J. and Rao, P. Someshwar—Free Trade, Scale Economies and Productivity Growth in Canadian Manufacturing

Liberalized trade between Canada and the United States has long been advocated on the grounds that it would permit Canadian manufacturers to take advantage of the scale economies associated with a larger market and thus lead to improved productivity. This paper reports estimates of the degree of scale economies and its contribution to total factor productivity growth in 22 Canadian manufacturing industries. The main conclusion is that the exten-

of scale economies has been grossly exaggerated. Consequently, the potential productivity gains to Canada from freer trade are unlikely to be as great as some economists have predicted. *Manchester Sch. Econ. Soc. Stud.*, Dec. 1986, 54(4), pp. 391-402. Economic Council of Canada.

**McCheaney, Fred S.**—Sensationalism, Newspaper Profits and the Marginal Value of Watergate

Newspaper publishers supposedly profit from sensational events. Focusing on the two different products sold by publishers, newspapers and advertising space, this paper shows why sensational events do not necessarily increase publishers' wealth. It also uses financial market analysis to examine the wealth effects of one sensational event, Watergate, on a portfolio of newspaper stocks and on the *Washington Post* in particular. No significant effects are found. *Econ. Inquiry*, Jan. 1987, 25(1), pp. 135-44. University of Chicago.

632 Industry Studies: Extractive Industries

**Boyd, Gale A.**—Factor Intensity and Site Geology as Determinants of Returns to Scale in Coal Mining

Increasing returns to scale (RTS) is frequently postulated as affecting productivity in surface coal mining. However, it is not clear whether increased capital intensity or increased output is the relevant phenomenon. A ray-homothetic production function that incorporates the capital labor mix and fixed site geology into the scale elasticity is presented and estimated with a micro (mine level) dataset. The results indicate that higher capital intensity contributes to higher RTS for some types of capital equipment, but not all. On the average, increasing RTS was found, with few mines approaching optimal scale. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 18-23. Argonne National Laboratory, Argonne, Illinois.

**Geroski, Paul A; Ulph, Alistair M. and Ulph, David T.**—A Model of the Crude Oil Market in Which Market Conduct Varies

This paper describes a model which first identifies (in an estimatable manner) parameters which describe the conduct each decision

maker in an oligopoly expects from its rivals, and then allows them to vary in a systematic fashion across rivals and over time. The model is applied to ten producing countries in the crude oil market (1966I to 1981III). A fully dynamic demand system is estimated, together with equations describing price choice and variations in conduct, and the null hypothesis of constant conduct is rejected against the more general alternative proposed here. *Econ. J. Supp.* 1987, 97, pp. 77-86. University of Southampton; University of Bristol.

**Hoffman, Elizabeth and Marsden, James R.**—Testing Informational Assumptions in Common Value Bidding Models

This paper provides an example of a means of linking mathematical theory, laboratory experiments, and standard empirical work. Theory, by necessity, abstracts from the naturally occurring world, and experiments designed to test theory must incorporate the same abstractions. On the other hand, empirical tests are generally performed on naturally occurring data, which may not reflect those same abstractions. Given this possible divergence, naturally occurring data should be tested for consistency with theoretical assumptions whenever possible. On the basis of standard symmetric bidding theory, this paper reports on a preliminary version of such a test for offshore oil bidding data. *Scand. J. Econ.*, 1986, 88(4), 627-41. Purdue University; University of Kentucky.

**Mulherin, J. Harold**—Specialized Assets, Governmental Regulation, and Organizational Structure in the Natural Gas Industry

Recent scholarship has posited that the form of organization chosen for an individual transaction will be affected by the particular features of the transaction, including the degree of asset specificity. This paper applies the thoughts of this scholarship to the organizational structure of the U.S. natural gas industry during this century. Complex methods of organization, such as vertical integration, exclusive dealing, and requirements contracts, are shown to be competitive responses to the possibility of opportunistic behavior. These results contradict the historical association of such methods with mar-

ket power and have direct implications for anti-trust and energy policy. *J. Inst. Theoretical Econ.*, Sept. 1986, 142(3), pp. 528-41. Clemson University.

### 636 Nonprofit Industries: Theory and Studies

**Feigenbaum, Susan**—Competition and Performance in the Nonprofit Sector: The Case of U.S. Medical Research Charities

This paper develops a model of nonprofit firm behavior which links nonprofit market structure, firm-specific characteristics, and firm performance. A method for defining nonprofit industries is proposed in order to generate measures of intramarket competition for donations in one specific philanthropic "industry"—the medical research charity industry. These measures and other data are used to estimate structure-performance relationships implied by the behavioral model. Analysis of administrative, fundraising and research allocations shows that market structure is indeed important in determining the behavior of charities. Increases in market concentration lead to reduced funding for research projects and greater discretionary expenditures. *J. Ind. Econ.*, Mar. 1987, 35(3), pp. 241-53. Claremont McKenna College, Claremont, California.

## 700 Agriculture; Natural Resources

### 710 AGRICULTURE

#### 711 Agricultural Supply and Demand Analysis

**Delgado, Christopher L.**—A Variance Components Approach to Food Grain Market Integration in Northern Nigeria

A variance components methodology is developed for joint tests on a sample of time series of prices for seasonal differences in the price integration of markets. The approach requires a statistically adequate number of observations for each market within seasons characterized by constancy of transactions costs among markets. The model is applied to eighteen months of weekly grain prices for twenty-two villages in northern Nigeria. Results suggest that markets are not well integrated in the six months covering the harvest period. Implications are drawn for research on market performances in the region. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 970-79. International Food Policy Research Institute, Washington, D.C.

#### **Knapp, Keith C.**—Dynamic Equilibrium in Markets for Perennial Crops

A dynamic equilibrium model for perennial crop markets is formulated. Price expectations are formed according to perfect foresight, and both the age composition of the crop and the optimal rotation are determined endogenously. The model is applied to the California alfalfa market. The calculated long-run equilibrium acreage is quite close to average acreage over the base period. The results also exhibit cyclical fluctuations in acreage with a six percent coefficient of variation. Thus, cyclical behavior can arise from technical characteristics of the production process as well as from imperfectly formed expectations or random exogenous shocks. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 97-105. University of California, Riverside.

#### **Olmstead, Alan L. and Wooten, Donald B.**—Bee Pollination and Productivity Growth: The Case of Alfalfa

The spread of commercial pollination has received little attention in the literature analyzing the growth in U.S. agricultural productivity. Between World War I and 1960, growers of most fruits, nuts, and seeds came to realize that intensive bee pollination was essential to achieve high yields. Alfalfa seed growers were among the last groups to adopt commercial pollination. This article examines the dramatic impact that concentrating bees in alfalfa seed fields has had on yields, resulting in the restructuring of the alfalfa industry (the fourth most valuable commodity grown in the United States) in the 1950s. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 56-63. University of California, Davis.

#### **Thurman, Walter N.**—The Poultry Market: Demand Stability and Industry Structure

The stability of the demand for poultry meat and specification issues in its estimation are explored. The analysis concludes that the demand for poultry meat shifted out in the early 1970s. At the same time, the demand relationship between poultry and pork changed from substitution to independence. A second conclusion is that poultry price is predetermined for demand in annual U.S. data, while quantity is not. A predetermined price suggests several market structures, and exogeneity tests are performed

to distinguish among them. The results are consistent with a competitive, constant returns-to-scale industry facing elastic factor supplies. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 30-37. North Carolina State University.

#### 713 Agricultural Policy, Domestic and International

**Byerlee, Derek, and Sain, Gustavo**—Food Pricing Policy in Developing Countries: Bias against Agriculture or for Urban Consumers?

Price policy discrimination against agricultural producers, in order to provide cheap food for urban consumers, has been widely cited in development forums as a cause of agricultural stagnation. Evidence is presented that suggests no consistent pattern of discrimination against producers for a major food commodity, wheat. However, consumer subsidies and trade policies have reduced bread prices to urban consumers in many countries. Price data from the early 1980s are assembled for thirty-one developing countries. Nominal protection coefficients for producers and consumers at official and corrected exchange rates and wheat-fertilizer price ratios are estimated for each country. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 961-69. International Maize and Wheat Improvement Center, Islamabad, Pakistan; International Maize and Wheat Improvement Center, Mexico City, Mexico.

#### **Gardner, Bruce L.**—Causes of U.S. Farm Commodity Programs

This paper is an attempt to explain variations by commodity in producer protection afforded by farm price support programs since the 1930s. Particularly emphasized are the ideas that these programs are essentially income redistributive measures and that, given political forces, the programs are attempts to redistribute efficiently. Variables associated with the cost to producers of generating political pressure and the social cost (deadweight losses) of redistribution are both found to be empirically important. *J. Polit. Econ.*, Apr. 1987, 95(2), pp. 290-310. University of Maryland.

#### **LeBlanc, Michael and Hrubovcak, James**—The Effects of Tax Policy on Aggregate Agricultural Investment

The effects of tax policies on aggregate agricultural investment are examined. Results from this analysis suggest that tax policies are effective in promoting agricultural investment. Nearly 20 percent of net investment in agricultural equipment during the period 1956 through 1978 is attributed to tax policy. From 1956 to 1978, tax policy has stimulated, in real dollars, over \$5 billion in net investment in equipment and in excess of \$1 billion in structures. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 767-77. U.S. Department of Agriculture, Washington, D.C.

#### **Schmitz, Andrew; Sigurdson, Dale and Doering, Otto**—Domestic Farm Policy and the Gains from Trade

This paper assesses the extent to which the gains from agricultural trade are influenced by both U.S. domestic policy and tariff and nontariff trade barriers. It shows theoretically that the volume of trade can be substantial but the gains nonexistent. Empirical results, along with rent-seeking arguments, support the no-gains-from-trade hypothesis. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 820-27. University of California, Berkeley; Government of Saskatchewan, Canada; Purdue University.

#### 714 Agricultural Finance

##### **Ahmad, Ismail; Duft, Ken D. and Mittelhammer, Ron C.**—Analyzing Equity Capital Programs of Banks for Cooperatives

Characteristics of Banks for Cooperatives' term loan and equity capital programs contribute toward complex intermittent exchanges of positive and negative cash flows between the cooperative lender and borrower, and complicate the analysis of the net present value and effective interest of the financing project. A multiperiod linear program was developed to analyze the effect of variations in equity capital program components on the present value of the financing project. Furthermore, the concept of a "mixed financing project" was used to analyze the effective interest rate associated with such projects. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 849-56. Universiti Pertanian Malaysia, Serdang; Washington State University; Washington State University.

**Leathers, Howard D. and Chavas, Jean-Paul**—Farm Debt, Default, and Foreclosure: An Economic Rationale for Policy Action

Economic analysis of farm programs typically focuses on economic costs. Here we show that, because of market failures and imperfections, there are possible economic benefits to be derived from programs which reduce or eliminate the threat of default and foreclosure. A production model of an indebted firm is developed and serves as a basis for an aggregate model which identifies possible costs and benefits from a program of transfers to indebted farmers. The challenge facing policy makers is to design programs which capture the benefits of reducing the probability of default while minimizing perverse incentive effects of such programs. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 828-37. University of Maryland; University of Wisconsin.

**Lowenberg-DeBoer, John and Boehlje, Michael**—The Impact of Farmland Price Changes on Farm Size and Financial Structure

A modified Vickers model (1968) is used to show that farmland capital gains provide incentive to increase farm acreage and debt use. Farmland capital losses have the opposite effect. The model indicates that part of the current financial vulnerability of the U.S. farm sector can be traced to management decisions made in response to the farmland capital gains of the 1970s. The effects are not purely tax driven, although taxes can affect the magnitude of incentives. The Vickers model is modified to allow a finite horizon, taxes, and the recognition of unrealized capital gain or loss. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 838-48. Purdue University; University of Minnesota.

#### 715 Agricultural Markets and Marketing

**Caswell, Julie A.**—Dominant Forms of Corporate Control in the U.S. Agribusiness Sector

Two forms of control over corporate decision making are analyzed: direct control through stockholding and network control through interlocking board of directors. A majority of the 222 large agribusiness firms studied had strong direct control by owners or cooperatives, while

the largest firms lacked such control. Tests relating direct control type to level of network control exposure show that strong direct control is associated with weak network control and vice versa, with firm size being the major factor in explaining both types of control. For the largest firms, network-based rather than direct control appears to limit the management discretion. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 11-21. University of Massachusetts.

**Hauser, Robert J. and Andersen, Dane K.**—Hedging with Options under Variance Uncertainty: An Illustration of Pricing New-Crop Soybeans

The behavior of a commodity's price-return variance over time is critical to both the theory and practice of commodity option valuation. In this paper, three models are used to forecast soybean price variance for the period during which a seasonal increase in variance has been found in previous studies. A time-series model outperforms the ordinary least squares and naive models. The significance of the forecast error levels is then examined in terms of expected deviations above and below a price target for a put hedge. The resulting trade-off between risk and return is shown by strike price and variance expectation. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 38-45. University of Illinois.

**Thompson, Stanley R. and Bond, Gary E.**—Offshore Commodity Hedging under Floating Exchange Rates

Exchange rate uncertainty can have significant effects on the optimal hedging behavior of offshore commodity traders. In this paper, the standard commodity hedging framework is extended to incorporate exchange rate uncertainty and forward cover transactions in the foreign exchange market. The implications of exchange rate movements and forward cover decisions for offshore commodity hedgers are illustrated using data relevant to hedging Australian export wheat on the Chicago Board of Trade. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 46-55. Michigan State University; Livestock and Grain Producers Association, Armidale, Australia.

**Zanias, George P.—Adjustment Costs and Rational Expectations: An Application to a Tobacco Export Model**

The effect of adjustment costs on international trade has been captured in an ad hoc fashion in past analysis, whereas a certainty environment is many times assumed. In this article, adjustment costs are explicitly considered in the modeling procedure of tobacco exports from Greece, and rational expectations are introduced. The results are consistent with considerable price competition and a large difference between immediate and long-run responses due to adjustments costs, that explain in part the evolution of tobacco exports from Greece and suggest that their elasticities might be found in international trade if adjustment costs are properly treated. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 22–29. University of Oxford.

**716 Farm Management**

**Anderson, James L. and Wilen, James E.—Implications of Private Salmon Aquaculture on Prices, Production, and Management of Salmon Resources**

The emergence of large-scale salmon ranching in the Pacific Northwest has led to significant controversy over the potential impact of salmon ranching on market structure, salmon prices, ocean and aquacultural production, and salmon fishing regulation. This paper models the behavior of a dominant salmon rancher facing a competitive open-access fishery using dynamic nonlinear programming. Primary attention is given to production and regulation-influencing strategies of an optimally managed salmon ranch under selected institutional and biological constraints. The effect of such behavior is evaluated with regard to salmon prices, natural salmon stocks, ocean fishing effort, and ocean fishery productivity. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 866–79. University of Rhode Island; University of California, Davis.

**Antle, John M. and Hatchett, Stephen A.—Dynamic Input Decisions in Econometric Production Models**

This study develops an econometric methodology for estimating dynamic production mod-

els with sequential intermediate input decisions. Two problems arise in the study of intermediate inputs: intermediate input decisions may be endogenous to final output, and intermediate inputs are likely to be correlated with each other and other variables, making identification and estimation difficult. The econometric model measures the productivity of intermediate inputs, taking into account the farmer's sequential input decisions and input productivity differences during the growing season. A multistage Cobb–Douglas model of wheat response to irrigation water is used to illustrate the proposed methods. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 939–49. University of California, Davis; North Carolina State University.

**Barry, Peter J. and Robison, Linton J.—Economic versus Accounting Rates of Return for Farm Land**

This paper explores the differences in pricing and rate of return relationships for nondepreciable (land) assets and depreciable assets. These relationships are evaluated analytically and in terms of other studies that have identified inconsistencies between accounting and economic rates of return. Asset pricing models formulated under certainty conditions are used to highlight the pricing differences, and a simulated numerical analysis is used to illustrate the effects of different parameter values. Implications then are considered for measures of investment performance and liquidity management. *Land Econ.*, Nov. 1986, 63(4), pp. 388–401. University of Illinois; Michigan State University.

**Lee, Hyunok and Chambers, Robert G.—Expenditure Constraints and Profit Maximization in U.S. Agriculture**

This paper considers the effect of expenditure constraints on producer profit maximization. A theory of expenditure-constrained profit maximization that provides restrictions for testing the competing null hypotheses of unconstrained and expenditure-constrained profit maximization is developed. The resulting model is fitted to aggregate U.S. agricultural data. The hypothesis of unconstrained profit maximization is rejected, while expenditure-constrained profit maximization cannot be rejected for U.S. agri-

culture. U.S. farmers apparently experience binding constraints in financing their variable production costs. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 857-65. U.S. Department of Agriculture, Washington, D.C.; Council of Economic Advisers, Washington, D.C. and University of Maryland.

**McSweeney, William T.; Kenyon, David E. and Kramer, Randall A.**—Toward an Appropriate Measure of Uncertainty in a Risk Programming Model

The measure of uncertainty in a risk-programming problem has long posed a dilemma. The use of the variance of realized returns assumes that the distribution of realized returns is the same as the distribution anticipated by the decision maker prior to the start of production. Rejection of this maintained hypothesis requires either direct elicitation of these distributions or construction of another measure from realized data. A mean-squared error is considered an appropriate measure. Optimal solutions to a quadratic risk-programming problem are obtained using this measure and compared to those obtained using traditional measures. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 87-96. The Pennsylvania State University; Virginia Polytechnic and State University; Virginia Polytechnic and State University.

**Musser, Wesley N.; Tew, Bernard V. and White, Fred C.**—Choice of Depreciation Methods for Farm Firms

Accelerated depreciation methods are usually considered to increase the present value of after-tax cash flows for farm firms compared to straight line methods. Review of the theoretical foundation of this conclusion indicates that it requires an assumption of constant marginal income tax rates, which is inappropriate for many farm firms. Numerical analysis of a more general theoretical model, and a detailed capital budgeting example, both indicate that straight line methods are preferred with income tax rates below maximum levels and/or lower discount rates. General recommendations on depreciation methods are therefore impossible. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 980-89. Oregon State University; University of Kentucky; University of Georgia.

**Reid, Donald W. and Bradford, Garrett L.**—A Farm Firm Model of Machinery Investment Decisions

This article presents a multiperiod mixed integer programming (MMIP) model of optimal machinery decisions. Infinite horizon valuation models of replacement and other investment situations are conceptualized in the context of a finite programming model. Dual properties of the MMIP model are used to identify and value opportunity costs involved in investment decisions of farm machinery. The interdependent nature of investment and production relationships necessary for solving these values emphasizes the importance of a holistic firm perspective in analyzing farm machinery investment strategies. An empirical situation is used to demonstrate model application. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 64-77. University of Georgia; University of Kentucky.

**Romero, Carlos; Amador, Francisco and Barco, Antonio**—Multiple Objectives in Agricultural Planning: A Compromise Programming Application

This article shows how multiobjective programming, compromise programming, and filtering techniques can be used to tackle some problems found in agricultural planning. A real case involving the establishment of workers' co-operatives within an agrarian reform program in Andalusia (Spain) is studied. The underlying problem is to find a compromise between the following objectives: employment, seasonal labor, and business profitability. The multiobjective programming approach is used to find the efficient set among these objectives, and after a filtering procedure, a compromise between the objectives is established based on the compromise programming approach. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 78-86. University of Cordoba, Spain.

**Stefanou, Spiro E.**—Technical Change, Uncertainty and Investment

The expected investment dynamics of the risk-neutral firm is examined in the presence of uncertainty in the future evolution of the real wage and the stock of technical knowledge. A model of the adjustment cost firm is developed that is characterized by quasi-fixed, factor-

augmenting technical change that is taken exogenously by the firm. The effect of wage and technical change uncertainty on investment behavior is assessed using comparative stochastic dynamics analysis. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 158-65. Pennsylvania State University.

**Vasavada, Utpal and Chambers, Robert G.—Investment in U.S. Agriculture**

Resource adjustment problems in U.S. agriculture are motivated against the background of the farm problem. The adjustment cost hypothesis is invoked to specify and estimate consistently a system of dynamic investment demand and output supply equations by utilizing recent advances in dynamic duality theory. The investment demand equations assume the form of a multivariate flexible accelerator. Results indicate that labor, capital services, and land exhibited quasi-fixity while intermediate materials were a variable factor. This can be construed as a form of asset fixity within aggregate U.S. agriculture. The univariate flexible accelerator hypothesis is rejected. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 750-60. University of Georgia; Council of Economic Advisers, Washington, D.C. and University of Maryland.

**717 Land Reform and Land Use**

**Caswell, Margaret F. and Zilberman, David—The Effects of Well Depth and Land Quality on the Choice of Irrigation Technology**

This paper introduces a framework to study the effects of farm characteristics (land quality and well depth) and irrigation technology characteristics (application effectiveness and pressurization requirement) on a farmer's choice of irrigation system. Conditions indicating how the adoption of drip or sprinkler irrigation affects water and energy demands are presented, as well as conditions under which these technologies are likely to be adopted. Two functional forms for the production function (quadratic and Cobb-Douglas) are presented with realistic values of key parameters. The empirical analysis demonstrates the importance of using forms which are consistent with the classical three stages of production. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 798-811. University of California,

Santa Barbara; University of California, Berkeley.

**McGuckin, J. Thomas, et al.—Optimal Control of Irrigation Scheduling Using a Random Time Frame**

A dynamic programming model of irrigation scheduling is developed which accounts for stochastic weather conditions, results in simple irrigation decision rules, and can be operated on current microcomputers. The model employs heat unit intervals, instead of chronological time, to define the dynamic equations of the crop-soil system. Procedures are outlined for estimating the transition probabilities of climate within the heat unit intervals. When compared to maximum yield irrigation scheduling, the model increases net returns of corn, sorghum, and cotton by \$10,000 to \$30,000 per acre. Coauthors are Craig Mapel, Robert Lansford, and Ted Sammis. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 123-33. New Mexico State University, Las Cruces.

**Peterson, Willis—Land Quality and Prices**

Although land values reflect land quality, the quality characteristics that determine values are only partly related to agricultural uses. The results of estimating a reduced-form equation explaining differences in land prices among states suggest that nearly two-thirds of this variation is attributed to nonagricultural uses. Therefore, a land quality index based on raw land prices will be biased, which in turn will result in biased coefficients in a production function or its dual. A cross-section land quality index which excludes the influence of nonagricultural uses is constructed. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 812-19. University of Minnesota.

**720 NATURAL RESOURCES**

**721 Natural Resources**

**Bolle, Friedel—On the Oligopolistic Extraction of Non-renewable Common-Pool Resources**

In recent literature the extraction of common-pool resources has been discussed under the aspect of whether or not they can be used efficiently when a finite number of agents has access to the resource. The objective of this paper is the derivation of a necessary equilibrium condition in a simple model. This condi-

tion has severe consequences for existence propositions in papers of M. C. Kemp and N. V. Long (1980), J. McMillan and H. W. Sinn (1984), and J. F. Reinganum and N. L. Stokey (1985). *Economica*, Nov. 1986, 53(212), pp. 519-27. University of Hamburg.

**Cairns, Robert D. and Lasserre, Pierre**—Sectoral Supply of Minerals of Varying Quality

In this sectoral model of mineral production, investment in capacity and variation in ore-body grade and volume help explain some stylized facts. More than one grade of ore may be exploited simultaneously. Mine exhaustion, but not necessarily entry, occurs in declining order of grade. The price may rise or fall but is likely to fall initially and must eventually rise, at less than the interest rate unless demand expands rapidly. These trends exhibit fluctuations due to entry and exhaustion of deposits. Resource price cyclicity is reinforced because mines keep producing at capacity when the price is falling. *Scand. J. Econ.*, 1986, 88(4), pp. 605-26. McGill University; University of Montreal.

**Chapman, Duane**—Computation Techniques for Intertemporal Allocation of Natural Resources

Application of optimal theory to applied problems is limited by the difficulty of numerical solutions. Typically, terminal values for the production period, price, or production level have been assumed rather than optimized. The use of an objective functional with explicit discounting gives direct solution values for the length of the time period, production as a function of time, price as a function of time, and rent (or consumer surplus) for continuous or discrete problems. The method is usable for numerical solutions to problems with linear demand, cost trend, or expropriation risk. It is illustrated with Fisher's widely used discrete problem and with application to parameters representing remaining world oil resources for competitive and monopolistic assumptions. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 134-42. Cornell University.

**Copes, Parzival**—A Critical Review of the Individual Quota as a Device in Fisheries Management

Limited entry licensing, introduced to deal with the common property and open access problems of the fishery, has proven to be an imperfect management device. As an alternative, the individual quota is now being widely advocated as the solution to the fisheries problem. This paper explores a variety of difficulties that should be anticipated with the application of an individual quota regime. It concludes that the individual quota should be considered with caution, as it is not a suitable management device under many common conditions. *Land Econ.*, Aug. 1986, 62(3), pp. 278-91. Simon Fraser University.

**Foster, William E., et al.**—Distributional Welfare Implications of an Irrigation Water Subsidy

The distributional welfare implications of a subsidy for irrigation water for California rice producers are analyzed. A more general equilibrium approach than that used in previous studies is taken in order to determine the effects of subsidy on consumers, subsidized producers, and unsubsidized producers. The two important policy conclusions of the results are that unsubsidized producers bear part of the cost of a subsidy through lower prices, and that consumers (taxpayers) may gain by sponsoring increased production through a selective subsidy. Coauthors are Linda S. Calvin, Grace M. Johns, and Patricia Rottschaefer. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 778-86. University of California, Berkeley.

**Fraser, Robert W.**—On the Relationship between Exploration and Extraction

This paper examines the behavior of a risk-neutral mining firm facing resource stock uncertainty. The particular emphasis of the paper is on the relationship between the firm's separate investment in the activities of exploration and extraction. The significance of this relationship is demonstrated in the context of its role in determining the effects of taxation policies on the firm's overall investment. It is thus argued that the evaluation of such policies should incorporate this relationship in order to be well formulated. *Australian Econ. Pap.*, June 1986, 25(46), pp. 135-43. University of Western Australia.

**Graham-Tomasi, Theodore; Runge, C. Ford and Hyde, William F.**—Foresight and Expectations in Models of Natural Resource Markets

This paper explains the implications of a Keynesian view of asset markets for natural resource policy. It also attempts to clarify some traditional concepts such as option and quasi-option values in light of this perspective. The main conclusion is that when this approach is taken, the task of the resource economist is both complicated and enriched. *Land Econ.*, Aug. 1986, 62(3), pp. 234–49. University of Minnesota; University of Minnesota; Duke University.

**Livingston, Marie Leigh and Miller, Thomas A.**—A Framework for Analyzing the Impact of Western Instream Water Rights on Choice Domains: Transferability, Externalities and Consumptive Use

Instream water rights have been legitimized in several Western states and the issue is being debated in others. Serious questions have been raised concerning the impact of instream water rights on the water rights system in general and the resulting implications for water allocation. This paper introduces a framework for analyzing the impact of instream water rights on (1) the transferability of existing rights, (2) the incidence of external costs and benefits, and (3) changes in the level of total consumptive use. When applied to site-specific cases, the model is useful in evaluating the economic trade-offs involved in changing the structure of water rights. *Land Econ.*, Aug. 1986, 62(3), pp. 269–77. University of Northern Colorado and U.S.D.A.; Colorado State University.

**Long, Ngo Van and Sinn, Hans-Werner**—Surprise Price Shifts, Tax Changes and Supply Behaviour of Resource Extracting Firms

It is shown that a surprise increase in the current price (due to, say, a change in the tariff rate) may cause a resource firm to increase or decrease its current rate of extraction, depending on its expectation of future changes in the price. The key parameters are the rate of price change in the absence of the surprise shock, the rate of interest, and the rate of change of the tax rates. *Australian Econ. Pap.*, Dec. 1985,

24(45), pp. 278–89. Australian National University; University of Munich.

**Matulich, Scott C. and Hanson, Jeffrey E.**—Modeling Supply Response in Bioeconomic Research: An Example from Wildlife Enhancement

This paper provides an overview of a problem endemic to bioeconomic analysis and environmental policy formulation: the absence of suitable biological data to derive econometrically specified biophysical response surfaces and associated cost functions. The analytical framework and empirical model presented in this paper illustrate a pragmatic, interim approach to piecing together response surface information and cost functions from available data and expert opinion. A biological simulation model is combined with a nonlinear programming model to evaluate alternative wildlife enhancement plans in a proposed irrigation project. *Land Econ.*, Aug. 1986, 62(3), pp. 292–305. Washington State University.

**Plummer, Mark L.**—Supply Uncertainty, Option Price, and Option Value: An Extension

In this article, the author extends previous work by A. M. Freeman (1985) in analyzing the value of a change in the probability that a public good will be supplied. It is shown that the sign of "supply-side" option value, the difference between the option price and the expected consumer surplus associated with the probability change, depends on the relation between the marginal utility of income and the provision of the public good. In addition, as first established by Freeman, the addition of demand-side uncertainty exacerbates a potential ambiguity in the sign of option value. *Land Econ.*, Aug. 1986, 62(3), pp. 313–18. Federal Trade Commission.

**Toman, Michael A.**—"Depletion Effects" and Nonrenewable Resource Supply: A Diagrammatic Exposition

While the theory of nonrenewable resource supply has advanced significantly in the past few years, studies based on the narrow "r percent rule" model of supply behavior continue to appear. This paper presents a simple diagrammatic exposition of nonrenewable resource

supply theory that incorporates advances in the theory beyond the  $r$  percent rule. The diagrammatic framework emphasizes economic resource scarcity stemming from the influence of depletion on costs; the influence of dynamic "user costs" that reflect this scarcity on supply decisions; and interactions between decisions to extract from and add to reserves. The framework is intended to provide fresh insights to those conversant with mathematical versions of the broader theory and to make this theory more accessible to nonexperts. *Land Econ.*, Nov. 1986, 62(4), pp. 341-52. Resources for the Future, Washington, D.C.

Young, Robert A.; Daubert, John T. and Morel-Seytoux, Hubert J.—Evaluating Institutional Alternatives for Managing an Interrelated Stream-Aquifer System

Farmers relying on the South Platte River in northeastern Colorado for irrigation water have been found to be adversely affected by pumping from a groundwater deposit associated with the river. A simulation model of the hydrologic-legal-farmer decision system is developed and employed to analyze several institutional alternatives for managing the system. The "argumentation plan" approach recently developed by the state was shown to yield highest net incomes under both normal water supply and drought scenarios while protecting the prior rights of river water users. Anticipated opportunity costs of ground water use are internalized into pumpers' decisions. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 787-97. Colorado State University; Farm Credit Bank of Omaha; Colorado State University.

## 722 Conservation and Pollution

Adams, Richard M.; Hamilton, Scott A. and McCarl, Bruce A.—The Benefits of Pollution Control: The Case of Ozone and U.S. Agriculture

The adverse effects of ozone and other air pollutants on crop yields are well documented. This paper reports on an assessment of the benefits to agriculture arising from reductions in ambient ozone pollution. Estimates are derived using recent plant science data as input for a spatial equilibrium model of U.S. agriculture. Consistency of benefit estimates to biological and

economic sources of uncertainty is also investigated. Results suggest that the benefits of a 25 percent reduction in ambient ozone are substantial, amounting to \$1.7 billion. The robustness of these estimates varies across alternative assumptions concerning response data and export markets. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 886-93. Oregon State University; Northwest Economic Associates; Texas A&M University.

Batie, Sandra S. and Sappington, Alyson G.—Cross-compliance As a Soil Conservation Strategy: A Case Study

The financial impacts of a hypothetical cross-compliance program were estimated for seventy-six farmers in Gibson County, Tennessee. Several federal program benefits were compared to the least-cost method of achieving one of four different soil displacement limits to determine if the costs of voluntarily participating in a cross-compliance program were greater than the benefits. If cost sharing were available, farmers would have a positive incentive to cross comply to five tons per acre per year on 57.3 percent of all fields. This figure rises to 90.9 percent compliance at twenty tons per acre per year. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 880-85. Virginia Polytechnic Institute and State University; Louisa Feed Service, Virginia.

Kolstad, Charles D.—Empirical Properties of Economic Incentives and Command-and-Control Regulations for Air Pollution Control

Three fundamental issues appear to permeate the literature on the relative desirability of environmental regulations. One is the performance of economic incentives relative to command-and-control regulations. Within the class of economic incentives, there is the question of price controls (emission fees) versus quantity controls (marketable emission permits). A third issue concerns the spatial resolution of incentives. The purpose of this paper is to contribute empirical insight on these three issues through a case study of the "Four Corners" region of the Southwest United States. The authors present a model of regulatory design and industrial response for a variety of air pollution regulations and measure the welfare differences among reg-

ulations in this applied setting. *Land Econ.*, Aug. 1986, 62(3), pp. 250-68. University of Illinois.

**Livingston, Marie Leigh**—Evaluating the Performance of Environmental Policy: Contributions of Neoclassical, Public Choice and Institutional Models

Three schools of thought are analyzed in terms of their proficiency in evaluating environmental policy. Neoclassical economics is not designed to compare alternative policies; institutions are assumed to be fixed. While the public choice model has descriptive relevance, the concept of efficient institutional change is seriously flawed and without concrete means to evaluate institutional alternatives. Institutional theory contains normative principles (notably problem solving and diversity) that are useful in identifying strengths and weaknesses in environmental policy. On these grounds the Environmental Impact Statement process is criticized in terms of institutionalized polarization, information misuse, and high decision-making costs. *J. Econ. Issues*, Mar. 1987, 21(1), pp. 281-94. University of Northern Colorado.

**Ribaudo, Marc O.**—Consideration of Offsite Impacts in Targeting Soil Conservation Programs

The offsite impacts of soil erosion should be considered in targeting regions for soil conservation programs. Regions where a reduction in erosion on agricultural land would improve water quality are identified and compared to regions targeted using onsite criteria. Differences in the regions identified indicate that failure to consider both onsite and offsite impacts may result in inefficient targeting. *Land Econ.*, Nov. 1986, 62(4), pp. 402-11. U.S. Department of Agriculture, Washington, D.C.

**Söderbaum, Peter W. O.**—Environmental Management: A Non-traditional Approach

The nature of environmental problems suggests that holistic and interdisciplinary approaches to decision making are more fruitful than the "monetary reductionism" of conventional cost-benefit analysis. Among alternative approaches, positional analysis is explored in detail. It suggests a parallel study of monetary

and nonmonetary impacts and resources, and is open also for nonmonetary principles of resource management. Other elements of the approach are systems thinking, a distinction between flows and positions (to clarify irreversibilities and impacts upon future options), and a technique to identify and analyze interests affected. Conclusions are conditional and a more democratic role for the analyst is emphasized. *J. Econ. Issues*, Mar. 1987, 21(1), pp. 139-65. Swedish University of Agricultural Sciences, Uppsala.

## 723 Energy

**Carlevaro, Fabrizio; Chaze, Jean-Paul and Spierer, Charles**—Les déterminants de l'évolution annuelle de la consommation d'énergie en Suisse (The Determinants of the Evolution of the Annual Energy Consumption in Switzerland)

This proposes a method to quantify the importance of the factors explaining the evolution of the demand for energy. The method is based on the causal explanation of this demand provided by an econometric model that ties it to a stock of energy-using appliances and its intensity of use. An application to Switzerland, based on the model built at the University of Geneva for the Swiss Federal Energy Office, is presented. This application shows the main role of economic growth and weather conditions on the growth of the energy consumption in 1984. *Schweiz. Z. Volkswirtschaft. Statist.*, Mar. 1987, 123(1), pp. 1-22 (French). University of Geneva.

**Train, Kenneth E. and Strebel, Judi E.**—Energy Conservation and Rebates in Commercial Food Enterprises

State programs offer rebates to food enterprises for the installation of energy-saving devices. This paper estimates the impact of rebates on the probability of installing a device and the resultant energy saving. Under reasonable ranges for energy costs and rates of return on devices, the benefits of a rebate program, calculated as the value of the energy savings that are attributable to the program, exceed the costs of the program and devices. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 106-14.

University of California, Berkeley; University of California, Davis.

## 800 Manpower; Labor; Population

### 810 MANPOWER TRAINING AND ALLOCATION; LABOR FORCE AND SUPPLY

#### 811 Manpower Training and Development

Dickinson, Katherine P.; Johnson, Terry R. and West, Richard W.—The Impact of CETA Programs on Components of Participants' Earnings

This paper provides the first estimates of the net impact of CETA participation on the components of CETA participants' post-program earnings. Employing a sample of 1975 CETA enrollees and comparison groups drawn from the March 1978 CPS using a nearest-neighbor matching technique, the authors estimate statistically significant negative effects on men's earnings and statistically significant positive effects on women's earnings. These results stem partly from the impact of CETA participation on the likelihood of being employed after leaving the program and partly on the program's impact on hours worked and wages earned. *Ind. Lab. Relat. Rev.*, Apr. 1987, 40(3), pp. 430-41. SRI International; SRI International; Battelle.

#### 812 Occupation

Noether, Monica—The Growing Supply of Physicians: Has the Market Become More Competitive?

The stock of U.S. physicians at any point in time is modeled as a weighted average of the supply that a perfect cartel would produce and that would prevail under perfect competition. Estimation of a system of stock and income equations over the post-World War II period shows that, after holding constant demand and marginal cost conditions and accounting for gradual adjustment to changes in equilibrium, the weighting parameter has moved toward the competitive extreme since 1965. This rise in the degree of competition is estimated to have increased physician stock by 6 to 20 percent and concomitantly decreased medical incomes by 19 to 45 percent. *J. Lab. Econ.*, Oct. 1986,

700-07 Federal Trade Commission.

Shaw, Kathryn L.—Occupational Change, Employer Change, and the Transferability of Skills

Occupational change is modeled as a function of the individual's current quantity of occupational investment, expected values of future investment in alternative occupations, and the transferability of skills between occupations. Using the National Longitudinal Survey of Young Men, expected present values of income in alternative occupations are calculated as a function of proxies for skill transferability, occupational experience, and investment intensity. These present values are found to be significant determinants of occupational change, particularly for individuals with high employer tenure. These empirical results are a considerable improvement over the modeling of change as a function of age and education. *Southern Econ. J.*, Jan. 1987, 53(3), pp. 702-19. Carnegie-Mellon University.

#### 813 Labor Force

Morton, John D.—BLS Prepares to Broaden Scope of Its White-Collar Pay Survey

This article describes the expansion of the Bureau of Labor Statistics' National Survey of Professional, Administrative, Technical and Clerical Pay (PATC) to include all private services industries and smaller establishments. The expansion of survey coverage over the 1986-87 period will enhance the usefulness of PATC findings for individual occupations and allow more detailed analysis of the effects of employment size and industry on white-collar pay levels. Additionally, the Bureau will conduct test studies in 1987 to develop a broad-based national survey of salaries and benefits of white-collar workers. *Mon. Lab. Rev.*, Mar. 1987, 110(3), pp. 3-7. Bureau of Labor Statistics.

Ransom, Michael R.—The Labor Supply of Married Men: A Switching Regressions Model

According to the family utility function approach, the labor supply functions of married men should differ according to whether their wives also work. In this paper the author explicitly models the switching nature of labor supply while also accounting for the endogeneity of

the labor force participation decision of the wife, using an endogenous switching regressions model based on the quadratic family utility function. The model is estimated from a cross section of 1,210 married couples from the Panel Study of Income Dynamics. *J. Lab. Econ.*, Jan. 1987, 5(1), pp. 63-75. University of Arizona.

**Ross, Russell T.**—Analysis of the 1980 Sydney Survey of Work Patterns of Married Women: Further Results

Labor force participation, hours of work, and wage functions (reservation wage as well as market wage) are estimated in a second-generation static labor supply framework. Unique features of the study include the availability of direct data on previous market experience, a formulation of the impact of children on the participation decision which permits testing for the presence of economies of scale in childminding activities, estimation of the reservation wage function, and a data base which permits a clear distinction between earnings and other forms of income. *Econ. Rec.*, Sept. 1986, 62(178), pp. 325-37. University of Sydney.

**820 LABOR MARKETS; PUBLIC POLICY**

**821 Labor Economics**

**Abowd, John M. and Card, David**—Intertemporal Labor Supply and Long-Term Employment Contracts

The authors compare the implications of a symmetric information contracting model and a dynamic labor supply model for changes in earnings and hours. A simple test is whether earnings changes are more variable than hours changes, as predicted by the labor supply model, or less variable, as predicted by the contracting model. The authors apply this test to two longitudinal surveys of adult men and find that earnings are somewhat more variable than hours for men who never change employers. The estimates suggest that changes in earnings and hours not associated with survey measurement error occur at fixed wage rates. *Amer. Econ. Rev.*, Mar. 1987, 77(1), pp. 50-68. Princeton University.

**Adams, James D.**—Intertemporal Wage Variation, Employment, and Unemployment

A model of labor supply under uncertainty is developed, and comparative statics of current labor are carried out with respect to temporary and persistent wage change. This and a complementary analysis of measurement error suggest that individual wage growth leads to downward-biased estimates of intertemporal labor substitution. An alternative strategy, namely, the use of short-lived industry wage pulses in place of individual wage growth, is free of the above biases. Findings presented in the paper support this point of view. These results also suggest that intertemporal substitution has been undervalued as a source of cyclical changes in unemployment. *J. Lab. Econ.*, Jan. 1987, 5(1), pp. 106-29. University of Florida.

**Berkovitch, Elazar**—Implicit Labor Contracts to Explain Turnover

Aggregate data exhibit procyclical movement in the rate of turnover. However, existing models of turnover have been unable to explain this phenomenon. In this model the author generates turnover as an outcome of a second-best wage contract when there is asymmetry of information about workers' mobility costs. A wage contract that insures the "bad" ("unlucky") workers results in "good" ("lucky") workers earning less than their marginal productivity. Therefore, good workers with low mobility costs leave the firm for the spot market wage. This, combined with an aggregate shock, results in a procyclical rate of turnover. *J. Lab. Econ.*, Pt. 1, July 1986, 4(3), pp. 341-54. Northwestern University.

**Bulow, Jeremy I. and Summers, Lawrence H.**—A Theory of Dual Labor Markets with Application to Industrial Policy, Discrimination, and Keynesian Unemployment

This paper develops a model of dual labor markets based on employers' need to motivate workers. In order to elicit effort from their workers, employers may find it optimal to pay more than the going wage. This changes fundamentally the character of labor markets. The model is applied to a wide range of labor market phenomena. It provides a coherent framework for understanding the claims of industrial policy advocates. It also can provide the basis for a theory of occupational segregation and discrimination that will not be eroded by market forces.

Finally, the model provides the basis for a theory of involuntary unemployment. *J. Lab. Econ.*, Pt. 1, July 1986, 4(3), pp. 376-414. Stanford University and National Bureau of Economic Research; Harvard University and National Bureau of Economic Research.

**Carmichael, H. Lorne**—Reputations for Safety: Market Performance and Policy Remedies

This paper examines the provision of industrial safety in a competitive labor market under the assumption that it takes time for workers to learn about changes in safety levels at a firm. It is shown that safety will in general be underprovided and that in some cases government-enforced workmen's compensation can bring improvements. The results hold even though in equilibrium all workers are perfectly informed about the level of safety prevailing at each firm and each is free to move to any firm he likes. *J. Lab. Econ.*, Oct. 1986, 4(4), pp. 458-72. Queen's University.

**Coles, Jeffrey L.**—Nonconvexity in General Equilibrium Labor Markets

The classic case of nonconvexity in consumer opportunities is that of labor supply. While most studies of labor supply concentrate on the individual agent in partial equilibrium, this study considers general equilibrium. The author shows that even with nonconvex consumer opportunities, such as those involved in the labor supply decision, the standard theorems of general equilibrium models still hold. *J. Lab. Econ.*, Pt. 1, July 1986, 4(3), pp. 415-37. University of Utah.

**Dasgupta, Partha and Ray, Debraj**—Inequality as a Determinant of Malnutrition and Unemployment: Policy

This paper explores the policy implications that are obtained once it is recognized that at low nutrition intakes a person's "productivity" is an increasing function of intake. In the context of a fully general equilibrium model it is shown that if aggregate assets in an economy are neither large nor small, certain patterns of Lorenz improving asset redistributions (or nutrition transfers) increase aggregate output and reduce the volume of involuntary unemployment and the incidence of undernourishment.

*Econ. J.*, Mar. 1987, 97(385), pp. 177-88. University of Cambridge; Indian Statistical Institute.

**Gramm, Warren S.**—Labor, Work, and Leisure: Human Well-Being and the Optimal Allocation of Time

Analysis is based on interrelationships between levels of well-being, the substance of consciousness, and a labor-work-leisure ratio. Employing the polar opposite relationship, each continuum reflects economic and social progress in historic-cultural movement from subsistence society based on physical labor, with consciousness dominated by material necessities, toward the "high-consumption" society that incorporates (intellect) work and "creative leasures" with consciousness reoriented to the "art of living." Argument builds on Abraham Maslow's hierarchy of motivation; differentiation between production and consumption of necessities, amenities, and luxury goods; J. S. Mill's stationary state; and strands of utopian thought. *J. Econ. Issues*, Mar. 1987, 21(1), pp. 167-88. Washington State University.

**Hahn, F. H.**—On Involuntary Unemployment

This paper argues that on a proper definition of equilibrium "involuntary unemployment equilibrium" is a logically coherent concept. It then proposes two alternative routes of modeling the labor market (efficiency wage and "fairness") which allows an equilibrium with involuntary unemployment. *Econ. J.*, Supp. 1987, 97, pp. 1-16. University of Cambridge.

**Haltiwanger, John and Waldman, Michael**—Insurance and Labor Market Contracting: An Analysis of the Capital Market Assumption

In recent years a large literature has developed that investigates the role of insurance in labor market contracting. Papers in this literature typically assume that workers are completely restricted from borrowing. The authors argue, and to some extent demonstrate, that in many environments capital market imperfections do not lead to a no-borrowing result, rather to a capital market assumption intermediate between the no-borrowing assumption and the perfect capital market assumptions. The authors consider some of the ramifications that

this intermediate capital market assumption has on the type of insurance firms provide through the labor market contract. *J. Lab. Econ.*, Pt. 1, July 1986, 4(3), pp. 355-75. University of California, Los Angeles.

**Holmlund, Bertil**—Centralised Wage Setting, Wage Drift and Stabilisation Policies under Trade Unionism

This paper analyzes union behavior in a model with uncertainty about aggregate labor demand. When uncertainty is resolved, the labor market may be in excess demand or excess supply at the preset contractual wage. Wage drift occurs if excess demand is realized and the union's wage demand takes this into account. Stabilization policy involves government hirings in good times and firings in bad ones. Public employment expansion in slumps increases the union's wage demand. More surprisingly, a contraction of public employment in good times will also produce a higher contractual wage. *Oxford Econ. Pap.*, July 1986, 38(2), pp. 243-58. FIEF, Stockholm.

**Hosios, Arthur J.**—Layoffs, Recruitment, and Interfirm Mobility

Contract and search theories are integrated to provide a consistent explanation of contract formation, the intertemporal structure of labor markets, the absence of *ex post* clearing, and thus of unemployment in a contractual setting. Self-fulfilling equilibria are described in which low-productivity firms lay off some workers, while high-productivity firms' recruitment (search) intensity and the resulting degree of interfirm mobility are endogenous. The effects of severance pay on layoffs and mobility are identified. Finally, the market economy is shown to generate too few layoffs whenever high-productivity firms recruit new hires: without recruitment, laid-off workers are immobile and equilibrium is constrained efficient. *J. Lab. Econ.*, Oct. 1986, 4(4), pp. 473-502. University of Toronto.

**Howitt, Peter and McAfee, R. Preston**—Costly Search and Recruiting

A labor market model with costly search and recruiting is constructed. It incorporates many features found in other models and provides

new insights into the effects of externalities and transaction costs. The model possesses a continuum of equilibria, some of which may be Pareto-ranked, with different rates of unemployment. Despite the multiplicity of equilibria, comparative-statics results are obtained. *Int. Econ. Rev.*, Feb. 1987, 28(1), pp. 89-107. University of Western Ontario.

**Hutchens, Robert**—Delayed Payment Contracts and a Firm's Propensity to Hire Older Workers

There are jobs for which firms employ older workers but tend not to hire new older workers. This may be attributable in part to implicit contracts that discourage worker shirking and malfeasance by shifting compensation to the end of the contract. Such "delayed payment" contracts can introduce a form of fixed costs into the employment relationship. Much as with hiring and training costs, these fixed costs lead firms to hire primarily young (long-term) workers. While firms employ older workers—workers who are serving out the last years of their contract—they tend not to hire them. This paper presents empirical evidence that is consistent with this argument. *J. Lab. Econ.*, Oct. 1986, 4(4), pp. 439-57. Cornell University.

**Johnes, Geraint**—Error Removal, Loss Reduction and External Effects in the Theory of Strikes

Four theories of industrial stoppages are presented, which rationalize strikes by reference to improvements in information flows, direct pecuniary incentives to firms, and externality effects. The implications of the different models for patterns of bargaining and final settlements are derived, and policies appropriate for the resolution of each type of strike are discussed. *Australian Econ. Pap.*, Dec. 1985, 24(45), pp. 310-25. University of Lancaster.

**Lang, Kevin**—Pareto Improving Minimum Wage Laws

By increasing the expected wage in low skill jobs, a minimum wage law can reduce the incentive for low skill workers to imitate high skill workers in the signaling process. The gain from reduced investment in the signal can more than offset the loss from unemployment among

low skill workers so that total output increases. Moreover, with an appropriate poll tax on workers to compensate owners of capital, the law can make all workers and owners of capital better off. *Econ. Inquiry*, Jan. 1987, 25(1), pp. 145-58. University of California, Irvine.

**Pissarides, Christopher A.**—Trade Unions and the Efficiency of the Natural Rate of Unemployment

Decentralized wage setting in search equilibrium models is inefficient because the meeting firm and worker ignore the dependence of job-matching probabilities on the number of firms and worker engaged in search. This paper investigates whether risk-neutral monopolistic unions will have an incentive to internalize this externality. The author finds that the externality will be internalized only if the union's policy is chosen by unemployed persons. If employed persons influence union policy, both the union wage and unemployment will be too high. A tax on the union wage, combined with an employment subsidy to firms, can correct this inefficiency. *J. Lab. Econ.*, Oct. 1986, 4(4), pp. 582-95. London School of Economics.

**Shaffer, Sherrill L.**—An Alternative Theory of Upward Sloping Age-Earnings Profiles

The commonly observed increase of wages with experience cannot be entirely explained by increases in individual productivity over time. Several possible explanations of this fact have been advanced in the literature; this paper presents another. The Samuelsonian model (1975) of an unfunded social security system is adapted to show that, in an industry or sector with sufficient growth, there is an incentive for implicit transfers from junior or senior workers. Also discussed are possible market responses when growth rates turn negative. *Australian Econ. Pap.*, June 1986, 25(46), pp. 118-21. Federal Reserve Bank of New York.

**Sparks, Roger**—A Model of Involuntary Unemployment and Wage Rigidity: Worker Incentives and the Threat of Dismissal

This paper analyzes a model that highlights imperfect monitoring and the threat of dismissal as microeconomic underpinnings for the efficiency-wage hypothesis. The author's major in-

novation is to allow the rules for dismissal, as well as the wage, to be determined endogenously as the equilibrium of a Stackelberg game played between firms and workers. The key results are as follows: a nontrivial equilibrium (where positive output is produced) must involve involuntary unemployment in that employed workers are strictly better off than are the unemployed; in addition, the equilibrium wage is rigid with respect to exogenous shifts in productivity. *J. Lab. Econ.*, Oct. 1986, 4(4), pp. 560-81. Purdue University and University of Essex.

**Strand, Jon**—The Relationship between Wages and Firm Size: An Information Theoretic Analysis

The paper derives a positive relationship between the size of establishments and their average wage levels, together with a continuous wage distribution, from a model where firm sizes are endogenous. A fraction of the workers are imperfectly informed from friends about firms' wage strategies and the rest search among firms at random. The greater the share of workers that are informed, the higher is the average wage level and the smaller is the difference between firms' wage levels. Costly interfirm labor mobility is in general shown to be socially excessive. *Int. Econ. Rev.*, Feb. 1987, 28(1), pp. 51-68. University of Oslo.

**Taylor, Mark P.**—The Simple Analytics of Implicit Labour Contracts

This paper outlines the development and expounds some of the central ideas of implicit contract theory using only basic mathematics (mainly Lagrangeans) and diagrams. *Bull. Econ. Res.*, Jan. 1987, 39(1), pp. 1-27. Bank of England, London.

**822 Public Policy; Role of Government**

**Borba, Philip S. and Appel, David**—The Propensity of Permanently Disabled Workers to Hire Lawyers

Although a major objective of workers' compensation insurance is to reduce financial and legal uncertainties, a significant proportion of workers' compensation claimants with permanent injuries contest the benefit award. This analysis of a sample of 1,060 California workers

with permanent injuries suggests that educational level, union membership, the seriousness of the injury, and the availability to the injured worker of additional sources of income are all positively related to the propensity to hire an attorney. Also, injured workers satisfied with the employer's and insurer's handling of the claim apparently are less likely than other workers to hire an attorney. *Ind. Lab. Relat. Rev.*, Apr. 1987, 40(3), pp. 418-29. National Council on Compensation Insurance, New York.

**Nelson, Richard R.**—State Labor Legislation Enacted in 1986

This annual article summarizes labor legislation enacted during 1986, by jurisdiction. Laws were enacted in many traditional labor fields, including minimum wage protection, collection of unpaid wages, child labor, collective bargaining, and employment discrimination. Important legislation was also adopted involving whistleblower protection, prohibitions on the employment of illegal aliens, asbestos abatement, and the emerging issues of regulation of workplace smoking and testing employees for drugs and AIDS. *Mon. Lab. Rev.*, Jan. 1987, 110(1), pp. 49-66. Bureau of Labor Statistics.

**Schumann, Richard E.**—State and Local Government Pay Increases Outpace Five-Year Rise in Private Industry

Based on the Bureau of Labor Statistics' Employment Cost Index, wages and salaries increased by 36 percent in state and local governments, while pay in the private sector increased 27.9 percent during June 1981-86. Much of the difference in the size of wage changes between the two sectors can be explained by differences in the industrial and occupational composition of their work forces. The industrial and occupational groups which had the largest pay gains accounted for a higher proportion of employment in state and local government than in private industry. Over the last eleven years, however, pay probably increased by about the same percentage in the two sectors. *Mon. Lab. Rev.*, Feb. 1987, 110(2), pp. 18-20. Bureau of Labor Statistics.

**Smith, Robert Stewart**—Greasing the Squeaky Wheel: The Relative Productivity of OSHA Complaint Inspections

This paper questions the validity of allegations by the General Accounting Office in 1979 that OSHA was then allocating more of its resources to investigating worker complaints than the quality of those complaints warranted. Specifically, the author finds that complaint-initiated inspections and "general schedule" inspections (those made on the basis of targeting criteria developed by OSHA) were similarly productive in uncovering safety violations in 1977-79. The findings also suggest that the interindustry distribution of complaints closely matched the distribution of general schedule inspections, and complaints were not used by unionized workers as a weapon in negotiations. *Ind. Lab. Relat. Rev.*, Oct. 1986, 40(1), pp. 35-47. Cornell University.

**823 Labor Mobility; National and International Migration**

**Borjas, George J.**—Immigrants, Minorities, and Labor Market Competition

This paper investigates the extent of labor market competition among immigrants, minorities, and the native population. An analysis of 1980 U.S. Census data reveals that immigrants tend to be substitutes for some labor market groups and complements for others. The effects of shifts in immigrant supply on the earnings of native-born men are, however, very small. On the other hand, increases in the supply of immigrants do have a sizable impact on the earnings of immigrants themselves: an increase of 10 percent in the supply of immigrants, for example, reduces the immigrant wage by about 10 percent. *Ind. Lab. Relat. Rev.*, Apr. 1987, 40(3), pp. 382-92. University of California, Santa Barbara and National Bureau of Economic Research.

**Cymrot, Donald J. and Dunlevy, James A.**—Are Free Agents Perspicacious Peregrinators?

The perspicacious peregrinator model of Solomon W. Polachek and Francis W. Horvath hypothesizes that individuals decide to migrate based on the size of potential gains. This model is tested using the migration decisions of Major League Baseball players between 1977 and 1979. Potential gains are measured as the differ-

ence between earnings with and without migration. A distinction is made between players eligible for free agency and those ineligible so as to account for differences in the level of competition for players' services in different segments of this market. Migration is found to be related to the expected gain from earnings for players eligible for free agency, but not for those ineligible. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 50-58. Center for Naval Analyses, Alexandria, Virginia; Miami University, Oxford, Ohio.

**Straubhaar, Thomas—The Determinants of Workers' Remittances: The Case of Turkey**

This article examines the effectiveness of Turkish policies to attract emigrants' remittances from West Germany towards Turkey in the period 1963-1982. The empirical model reveals that incentives to attract remittances have not been very successful. Neither variations in exchange rates (i.e., premium exchange rates) nor changes in the real return of investments (i.e., foreign exchange deposits with higher returns) affected the flows of remittances toward Turkey, and the actual flow depended more on political stability than economic benefits. *Weltwirtsch. Arch.* 1986, 122(4), pp. 728-40. University of California, Berkeley.

**824 Labor Market Studies, Wages, Employment**

**Anderson, Kathryn H.; Butler, John S. and Sloan, Frank A.—Labor Market Segmentation: A Cluster Analysis of Job Groupings and Barriers to Entry**

Labor market segmentation is analyzed using data from the University of Michigan Panel Study of Income Dynamics. Indices of job traits are created using GLS regressions of job characteristics on industry, occupation, and demographic variables. A job is defined as a two-digit industry-occupation. Indices are used to choose the clusters of jobs with cluster analysis. Using a parametric test developed to determine when to stop agglomerating clusters, one large and one small job cluster were detected. A statistical test could not reject the hypothesis that the two clusters differed only randomly. No statistical evidence is found of a segmented labor market. *Southern Econ. J.*, Jan. 1987, 53(3), pp. 871-90. Vanderbilt University.

**Andrews, Martyn J.—The Aggregate Labour Market: An Empirical Investigation into Market-Clearing for the UK**

A two-equation model of the aggregate labor market is presented as part of a larger market-clearing macroeconomic framework, which is then estimated by a suitable subsystem estimator using annual data for the U.K., 1948-1979. Taken on their own theory—consistent estimates of both labor supply and labor demand are obtained. The maintained hypothesis that the market clears cannot be tested against a more general structural model within the framework presented; however, a test of the model against the data generation process suggests that the maintained hypothesis is untenable after 1966, which is confirmed by evidence of dynamic instability. *Econ. J.*, Mar. 1987, 97(385), pp. 157-76. ESRC Macroeconomic Modelling Bureau, University of Warwick.

**Andrews, Martyn and Nickell, Stephen J.—A Disaggregated Disequilibrium Model of the Labour Market**

This paper analyzes a number of disequilibrium models of the labor market. The most general of these assumes that the aggregate market consists of a series of submarkets, none of which are in excess demand, with the remainder being in excess supply. Assuming demands and supplies have a common structure across markets, with a normal error, then it is possible to write aggregate employment as a nonlinear function of the common structure and the parameters of the error distribution. Estimates of this model and various restricted versions of it are presented, including the standard run condition model and the equilibrium model. *Oxford Econ. Pap.*, Nov. 1986, 38(3), pp. 386-402. Warwick University; Oxford University.

**Atkinson, Scott E. and Tschirhart, John—Flexible Modelling of Time to Failure in Risky Careers**

Failure time models correcting for heterogeneity are used to explain the length of participation in a risky career. Using data from the National Football League, the authors first employ a class of techniques which ignore unobserved heterogeneity; hence these methods impose severe restrictions on the estimated

hazard. The authors then examine a second class of techniques which correct for unobservables and thereby allow greater flexibility in the estimated hazard. Within this second class, they find that the estimated hazard using the Burr-12 density is much more accurate than densities in the first class, which include the exponential and Weibull. They expect that this density could be employed to successfully explain career duration in other high-risk, high-stress careers as well. *Rev. Econ. Statist.*, Nov. 1986, 68(4), pp. 558-66. University of Georgia; University of Wyoming.

**Barron, John M.; Black, Dan A. and Loewenstein, Mark A.**—Employer Size: The Implications for Search, Training, Capital Investment, Starting Wages, and Wage Growth

An employer must choose a procedure for screening job applicants, a rate of hire, a training program for new employees, a criterion for the retention of new employees after observing their on-the-job performance, a compensation package, and a rate of capital investment so as to minimize production costs across time. This paper examines the effects of employer size on these hiring and training decisions when larger employers have greater monitoring costs. A unique data set is employed to estimate the empirical relation among employer size and employer search, training, capital investment, and wages. *J. Lab. Econ.*, Jan. 1987, 5(1), pp. 76-89. Purdue University; University of Kentucky; Virginia Polytechnic Institute and State University.

**Bartel, Ann P. and Lichtenberg, Frank R.**—The Comparative Advantage of Educated Workers in Implementing New Technology

The authors estimate labor demand equations derived from a (restricted variable) cost function in which "experience" on a technology (proxied by the mean age of the capital stock) enters "non-neutrally." The specification of the underlying cost function is based on the hypothesis that highly educated workers have a comparative advantage with respect to the adjustment to, and implementation of, new technologies. The empirical results are consistent with the implication of this hypothesis, that the relative demand for educated workers declines as the

ages of plant and (particularly) of equipment increase, especially in R&D-intensive industries. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 1-11. Columbia University.

**Beach, Charles M. and Kaliski, S. F.**—The Distribution of Unemployment Spells: Canada, 1978-82

This paper empirically examines entire distributions of unemployment spells according to a novel duration-share approach based on decile shares and Lorenz curves of unemployment. The approach is applied to a Canadian micro-data source akin to the Work Experience Surveys for the United States. Long-term unemployment accounts for a substantial portion of total weeks of unemployment, despite the short duration of the average spell of unemployment, and the structure of unemployment spell distribution differs significantly by gender, age, education, and region. *Ind. Lab. Relat. Rev.*, Jan. 1987, 40(2), pp. 254-67. Queen's University.

**Blundell, Richard; Ham, John and Meghir, Costas**—Unemployment and Female Labour Supply

The definition of labor force participation in the standard labor supply model stands in sharp contrast to that used in compiling the labor force statistics. In standard labor supply models, only those supplying positive hours of work are considered to be labor force participants. On the other hand, participation in the labor force statistics is often defined to include not only those supplying positive hours but also those actively searching for work. This paper is an attempt to reconcile these concepts and turns out to be a convenient way to enter demand side factors. The model is applied to the working behavior of married women in the U.K. Family Expenditure Survey. *Econ. J.*, Supp. 1987, 97, pp. 44-64. University College, London; University of Toronto; University College, London.

**Brooks, Clive and Volker, Paul**—The Probability of Leaving Unemployment: The Influence of Duration, Destination and Demographics

This paper examines the influences of a number of demographic characteristics and the duration of unemployment on the probability of

leaving unemployment. This probability is found to decrease as the duration of unemployment increases, with married females having the highest probability of exit. Various measures of average completed duration suggest that the longest spells of unemployment are incurred by older males. Some relevant considerations are also explored in the paper. *Econ. Rec.*, Sept. 1986, 62(178), pp. 296-309. Bureau of Labour Market Research, Canberra, Australia.

**Brown, Martin and Philips, Peter**—Competition, Racism, and Hiring Practices among California Manufacturers, 1860-1882

This paper examines Chinese men's participation in four California industries in the late 1800s to determine the relationship between product market structure and racist hiring practices. Because white women, a traditional source of cheap labor, were scarce in post-Gold Rush California white employers hired Chinese men, despite widespread anti-Chinese racism. As white women became plentiful, the canning and woolen mills industries began to switch to them, whereas the more competitive shoe and cigar industries continued to employ Chinese men. Factors other than market structure, however, resulted in particularly virulent anti-Chinese attitudes in the more competitive industries. *Ind. Lab. Relat. Rev.*, Oct. 1986, 40(1), pp. 61-74. Howard University; University of Utah.

**Card, David**—Efficient Contracts with Costly Adjustment: Short run Employment Determination for Airline Mechanics

This paper presents an empirical analysis of firm-specific employment and wage outcomes for mechanics in the domestic airlines industry. A dynamic contracting model is presented that incorporates both costly employment adjustment and potential gaps between contract wage rates and the opportunity value of workers' time. The model gives a useful description of the employment-output linkage in the data, but is less successful in capturing the dynamic relation between employment, contract wage rates, and wage rates outside the airline industry. *Amer. Econ. Rev.*, Dec. 1986, 76(5), pp. 1045-71. Princeton University.

**Chapman, Bruce J.**—Sex and Location Differences in Wages in the Australian Public Service

An empirical investigation of wage determination in the Australian Public Service (APS) over the 1970s is undertaken, revealing that persons employed in Canberra, and males generally, experienced salary advantages. The technique employed controls for education and length of time in both the labor force and the APS, and analyzes the same group of workers in 1969, 1974, and 1979. The location result did not vary substantially over the decade, but the female disadvantage was somewhat reduced from 1969 to 1974. It is demonstrated theoretically that the use of the variable length of time in the labor force biases upwards the estimate of the male salary advantage, but a test of the proposition shows that measurement error of this type does not markedly affect conclusions. *Australian Econ. Pap.*, Dec. 1985, 24(45), pp. 296-309. Australian National University.

**Cohany, Sharon R.**—Labor Force Status of Vietnam-Era Veterans

In 1985, data were collected for the first time on the labor force status of men who actually served in Southeast Asia, distinguishing between those with and without service-connected disabilities. The data confirm the precarious circumstances of disabled veterans, who were especially vulnerable to unemployment. The information is based on the Current Population Survey. In a supplement to the April 1985 survey, men eighteen and older were asked about their service in the Armed Forces and whether they had a service-connected disability. The supplement was cosponsored by the Veterans Administration and the two Department of Labor agencies—the Veterans Employment and Training Service and BLS. *Mon. Lab. Rev.*, Feb. 1987, 110(2), pp. 11-17. Bureau of Labor Statistics.

**Córdova, Efrén**—From Full-time Wage Employment to Atypical Employment: A Major Shift in the Evolution of Labour Relations?

Many observers are concerned that the steady increase in atypical forms of employment that dispense with contracts normally concluded under ordinary law may threaten the

principles that have governed labor relations up to now and give rise to a proliferation of unregulated employment situations that will undermine the traditional system. Of equal concern is the fragile, provisional, and precarious nature of atypical forms of employment, with all that this implies for the worker. The author analyzes the changes taking place in the traditional model, their causes, the controversies they have created, and their repercussions on individual and collective labor relations and on social security. *Int. Lab. Rev.*, Nov.-Dec. 1986, 125(6), pp. 641-57. International Labor Office.

**Jolton, P. J. and Makepeace, G. H.**—Sample Selection and Male-Female Earnings Differentials in the Graduate Labour Market

The standard approach to measuring earnings differentials is extended to include a female participation decision, and the effects of sample selection are analyzed. A substantial proportion of the earnings differential between men and women in the U.K. graduate labor market can be attributed to residual factors rather than attributes and characteristics. Women's earnings could be as much as 18 percent higher if these factors were removed. A statistically significant sample selection effect is present, but its quantitative impact on the measures of the residual differential is variable. The data are sufficiently comprehensive to justify wider academic interest. *Oxford Econ. Pap.*, July 1986, 38(2), pp. 317-41. University of Hull.

**Ehrenberg, Ronald G. and Sherman, Daniel R.**—Employment while in College, Academic Achievement, and Postcollege Outcomes: A Summary of Results

This paper uses panel data that cover the 1972-79 period obtained from the National Longitudinal Survey of the High School Class of 1972 to study how male students' employment while in college influences their academic performance, persistence in school, decisions to enroll in graduate school, and postcollege labor market success. Its analytic framework treats in-school employment as endogenous and determines persistence by a comparison of expected utilities. *J. Human Res.*, Winter 1987, 2(1), pp. 1-23. Cornell University; Federal Trade Commission.

**Ehrenberg, Ronald G. and Smith, Robert S.**—Comparable-Worth Wage Adjustment and Female Employment in the State and Local Sector

This paper simulates the likely effects of a comparable-worth, wage-adjustment policy in the state and local sector on female employment in the sector. The simulation is based on estimates of within-occupation male/female substitution and across-occupation employment substitution obtained using data from the 1980 Census of Population. *J. Lab. Econ.*, Jan. 1987, 5(1), pp. 43-62. Cornell University.

**Fuchs, Victor R.**—His and Hers: Gender Differences in Work and Income, 1959-1979

This paper describes changes in hours of work and income between 1959 and 1979 of women and men ages 25-64. It includes attempts to measure and value nonmarket production and leisure as well as market work, to take account of possible income sharing within households, and to allow for economies of scale in household production. The most important empirical result is that, relative to men, women's access to goods and services and leisure was lower in 1979 than in 1959. Changes in hourly earnings, hours of work, and household structure contributed to this result. The sex differential in hourly earnings is explored in detail. *J. Lab. Econ.*, Pt. 2, July 1986, 4(3), pp. S245-72. Stanford University and National Bureau of Economic Research.

**Goldberg, Matthew S. and Warner, John T.**—Military Experience, Civilian Experience, and the Earnings of Veterans

This paper examines the effects of military experience and civilian experience on the earnings of veterans with the objective of determining the substitutability of these two forms of experience for personnel receiving different types of military training. To perform the analysis, the Social Security earnings records of 24,000 individuals who separated from military service in fiscal year 1971 were obtained for the period 1972-77. Analysis of these data reveals that more military experience does increase subsequent civilian earnings, but that the relative impact of military and civilian experience

rience varies considerably by military occupation category. *J. Human Res.*, Winter 1987, 22(1), pp. 62-81. Center for Naval Analyses; Clemson University.

**Hersoug, Tor; Kjaer, Knut N. and Rødseth, Asbjørn**—Wages, Taxes and the Utility-Maximising Trade Union: A Confrontation with Norwegian Data

This paper estimates a model of wage formation where the central assumptions are: (1) except for a random error term, the aggregate wage level is determined by a single trade union; (2) union utility depends on the real disposable wage and on employment; and (3) firms determine employment and react to wage increases by reducing employment. The purpose is to see whether such a theory can be made operational and whether the model can be made to fit reasonably well with Norwegian data (1962-82). Results are mixed and do not give much support to the approach taken, but several possibilities for further refinement remain. *Oxford Econ. Pap.*, Nov. 1986, 38(3), pp. 403-23. Oslo University.

**Inglis, Paul A. and Stromback, Thorsten**—Migrants' Unemployment: The Determinants of Employment Success

This paper examines the influence of individual characteristics on the chance of being unemployed. Most of the attention is focused on the characteristics specific to migrants: birthplace, period of residence, and proficiency in the English language. The analysis is based on data from the 1981 Census. A migrant is less likely to be unemployed the longer he has been in Australia. The likelihood of being unemployed falls most during the first two years after arrival for all birthplace groups. Most of the higher unemployment rate for migrants relative to Australian-born is due to the high chance of recently arrived migrants being unemployed. *Econ. Rec.*, Sept. 1986, 62(178), pp. 310-24. Department of Employment and Industrial Relations, Canberra, Australia; Western Australian Institute of Technology, Bentley, Australia.

**Maloney, Timothy J.**—Employment Constraints and the Labor Supply of Married

Women: A Reexamination of the Added Worker Effect

Little evidence is found to support the "conventional" notion of the added worker effect. The husband's unemployment has no measurable impact on the wife's actual hours of work. However, the constraint on his ability to supply hours of work to the labor market—not simply his unemployment—influences his wife's labor supply. Furthermore, the observed hours of work of the wife may not accurately reflect her "desired" hours of work. The wife's labor supply is found to be positively associated with the unemployment and underemployment of her husband, and this added worker effect is estimated to be quite substantial. *J. Human Res.*, Winter 1987, 22(1), pp. 51-61. University of Missouri.

**Butler, Richard J. and McDonald, James B.**—Trends in Unemployment Duration Data

A method of estimating the distribution of uninterrupted unemployment spells from aggregate unemployment data is outlined. The methodology does not impose constant individual hazard rates and allows for heterogeneity. Characteristics of the distribution of unemployment spells are then considered including hazard rates, measures of inequality such as Gini coefficients, and the fraction of total unemployment associated with 5 weeks of unemployment. The relationship between these characteristics and labor demand variables (GNP) and supply-side variables (transfer payments, unemployment insurance) is considered in order to better understand the relative role of short- and long-run unemployment. *Rev. Econ. Statist.*, Nov. 1986, 68(4), pp. 545-57. Brigham Young University.

**van Opstal, Rocus and Theeuwes, Jules**—Duration of Unemployment in the Dutch Youth Labour Market

This paper is concerned with the specification and estimation of a one-state proportional hazard model to explain the duration of unemployment in the Dutch youth labor market. Special attention is given explaining the unequal distribution of unemployment experiences among young labor force participants. The model is estimated using data from a 1984 national ran-

dom sample of young people unemployed in May and interviewed in October/November. It is found that the replacement ratio has no significant effect. The predicted youth wage on the other hand is significant. The paper also presents and compares different functional forms for modeling duration dependence and heterogeneity. *De Economist*, 1986, 134(3), pp. 351-67. Central Planning Bureau, The Hague; Free University, Amsterdam.

**Sammartino, Frank J.—The Effect of Health on Retirement**

This article analyzes the influence of health on the timing of retirement. After reviewing the specific effects of the amendments on future retirement benefits, it presents a theoretical model of retirement timing that includes the influence of health and the effects of social security benefits. The author then reviews some recent empirical research on the role of health in the retirement decision, explores how health has been measured in these studies, and reviews the research on health and retirement that has explored differences in the effects of health based on occupation, race, and sex. The final section assesses research findings and draws some tentative conclusions. *Soc. Sec. Bull.*, Feb. 1987, 50(2), pp. 31-47. Social Security Administration.

**Shank, Susan E. and Haugen, Steven E.—The Employment Situation during 1986: Job Gains Continue, Unemployment Dips**

This article provides civilian labor force data by sex, age, and race based on the Current Population Survey, and also provides the number of employees on business payrolls, their average hours, and earnings based on the Current Employment Statistics program. It concludes that the labor market continued to improve in 1986, although at a slower pace than in the first two years of recovery from the 1981-82 recession. Civilian employment rose by about two million each in 1985 and 1986 while the unemployment rate continued to edge downward, reaching 6.9 percent in the second half of 1986. Virtually all of the job gains during 1986 took place in the service-producing sector. *Mon. Lab. Rev.*, Feb. 1987, 110(2), pp. 3-10. Bureau of Labor Statistics.

**Slade, Frederic P.—Retirement and State Dependence: A Longitudinal Study of Older Men**

This paper examines the role of state dependence in explaining the retirement status of older men. Following from the work of James Heckman and others, apparent and true state dependence are distinguished in a dynamic retirement model. Using a two year longitudinal sample of men aged 58 to 62 in 1969, apparent and true state dependence are controlled for through estimation of an error-components model and a retirement-transition model. The results indicate substantial evidence of state dependence. *J. Lab. Econ.*, Jan. 1987, 5(1), pp. 90-105. Rutgers University.

**Trivedi, P. K. and Hui, W. T.—An Empirical Study of Long-Term Unemployment in Australia**

The first part of this paper concentrates on modeling transitions out of unemployment using aggregated gross flow data. Models are estimated using monthly transition probabilities for March-April 1984. This analysis produces evidence consistent with negative duration dependence but sheds no light on the role of macroeconomic factors. The second part focuses on this issue. A time-series analysis of the proportion of long-term unemployment, using data for four age and sex groups, provides evidence that a proportionately greater increase in long-term unemployment in Australia in the 1970s has been associated with reduction in job availability. *J. Lab. Econ.*, Jan. 1987, 5(1), pp. 20-42. Australian National University.

**825 Productivity Studies: Labor, Capital, and Total Factor**

**Bemmels, Brian—How Unions Affect Productivity in Manufacturing Plants**

This study investigates several hypotheses as to how unions may affect productivity. Analysis of data from forty-six manufacturing plants for 1982 indicates a negative union impact on productivity. The author finds evidence suggesting that unions reduce the effectiveness of some managerial practices undertaken to increase productivity, and that a poor labor-management relations climate also reduces productivity. These two factors account for almost 50

percent of the negative union impact. *Ind. Lab. Relat. Rev.*, Jan. 1987, 40(2), pp. 241-53. University of Alberta.

Estrin, Saul; Jones, Derek C. and Svejnar, Jan—The Productivity Effects of Worker Participation: Producer Cooperatives in Western Economies

The paper presents econometric estimates of productivity effects of various forms of worker participation in Western producer cooperatives. While the effects vary across institutional settings, the overall effect is found to be positive. The positive effects are found most uniformly with respect to profit sharing and, to a slightly lesser extent, individual capital (share) ownership and participation in decision making by workers. The size of individual worker loans to the co-op is unrelated to productivity, while collective capital ownership exhibits an insignificant or a negative productivity effect. *J. Compar. Econ.*, Mar. 1987, 11(1), pp. 40-61. London School of Economics; Hamilton College; University of Pittsburgh.

Ichniowski, Casey—The Effects of Grievance Activity on Productivity

This study develops and tests a production function that includes a plant's grievance filing rate as a determinant of productivity. Application of that function to data on nine unionized paper mills for 1976-82 shows that the more grievances that were filed in a mill, the lower that mill's productivity. Although this effect produced only small percentage changes in the productivity of these mills, these changes, the author argues, could result in much larger percentage changes in the mill's operating profits. Finally, one nonunion mill that had no grievance procedure proved to have significantly lower productivity than the nine union mills. *Ind. Lab. Relat. Rev.*, Oct. 1986, 40(1), pp. 75-89. Columbia University.

Kemme, David M.—Productivity Growth in Polish Industry

Polish economists have long emphasized the need to increase factor productivity and enterprise efficiency to shift from an extensive pattern of development. Both individual and joint

factor productivity at the industrial branch level during the 1960-77 period are examined. Several industrial branches experienced an increase in the rate of growth of joint factor productivity during the mid 1970s. It also appears that coproduction and licensing agreements have contributed to these increases, whereas greater than average growth rates of gross fixed capital had little impact. *J. Compar. Econ.*, Mar. 1987, 11(1), pp. 1-20. Wichita State University.

Kibria, Muhammad G. and Tisdell, Clement A.—Productivity Progress Parameters for Manufacturing in an LDC: The Startup or Learning Phase in Bangladesh Jute Mills

Uses power functions and linear ratio functions to measure productivity progress attributable to learning as a time-dependent phenomenon in the startup phase of spinning and weaving processes in individual Bangladeshi jute mills. In so doing, it provides evidence on the importance of learning-by-doing in manufacturing in an LDC, namely in the production of heavy and light yarn and in the manufacture of sacking and hessian in Bangladesh. *Australian Econ. Pap.*, Dec. 1985, 24(45), pp. 370-79. Bureau of Industry Economics, Canberra; University of Newcastle.

Knight, J. B. and Sabot, R. H.—Educational Policy and Labour Productivity: An Output Accounting Exercise

Output accounting methods are used to measure the effect of education on labor productivity. Some of the drawbacks of this approach to estimating the contribution of education are overcome by exploiting a "natural experiment" (Kenya and Tanzania are similar in relevant respects except in their policies for secondary education) and by introducing and measuring cognitive skills and reasoning ability as links between education and earnings. The greater quality of education and quantity of secondary education in Kenya are shown to have an important effect on earnings and productivity. The implication is that Tanzania might gain considerably from adopting Kenya's educational policies. *Econ. J.*, Mar. 1987, 97(385), pp. 199-214. University of Oxford; Williams College.

830 TRADE UNIONS; COLLECTIVE BARGAINING;  
LABOR-MANAGEMENT RELATIONS

Reynolds, Morgan—Labor Relations at the Shop Floor Level

The view that a free economy and free society impoverish working people undergrids modern government involvement in labor markets and legal privilege for adversarial labor unions. This paper argues that most of the union difficulties managers must cope with at the shop-floor level stem from a fundamental source, namely: the philosophy of collectivism. The paper analyzes wage determination under personal and impersonal conditions, public policy toward labor contracts, and the role of businessmen in making labor markets operate more efficiently. *Managerial Dec. Econ.*, Mar. 1987, 8(1), pp. 7-53. Texas A&M University.

831 Trade Unions

Addison, John T. and Castro, Alberto C.—The Importance of Lifetime Jobs: Differences between Union and Nonunion Workers

The authors use CPS micro data to derive estimates of retention rates and eventual lifetime tenure probabilities for union and nonunion workers. Although both groups enjoy a considerable degree of near-lifetime employment (defined as eventual tenure of 20 + years with the firm), union workers evince measurably higher eventual tenure than their nonunion counterparts, especially among those with lower current tenure. A separate analysis suggests that this outcome may result in part from better job matching for union than for nonunion workers. The authors hypothesize that union workers enjoy an informational advantage in the labor market. *Ind. Lab. Relat. Rev.*, Apr. 1987, 40(3), pp. 393-405. University of South Carolina and Universität Regensburg, West Germany; Universidade do Porto, Portugal.

Chapman, P. G.—Alternative Trade Union Objective Functions in the Theory of Wage Bargaining

The paper concerns the appropriate specification of the trade union objective function for a unionized labor market. Particular attention is given to the expected effect of changes in membership size and the optimum wage. A summary

of the comparative static properties of a number of different objective functions is given and, with the exception of membership changes, there are no clear differences. The paper also comments on the implications of simultaneous changing membership levels and demand changes. It is argued that the implications of such changes depend on the type of objective function. *Manchester Sch. Econ. Soc. Stud.*, Dec. 1986, 54(4), pp. 367-79. University of Dundee, Scotland.

Eberts, Randall W. and Stone, Joe A.—Teacher Unions and the Productivity of Public Schools

The authors examine the title question using individual student data from the Sustaining Effects Survey. Holding resources constant and using achievement gains on standardized tests as the measure of output, they find that union districts are 7 percent more productive for average students. For the minority of significantly above- and below-average students, however, nonunion districts are more productive by about the same margin, apparently because teacher unions reduce the use of specialized instructional techniques. This result supports the view that unions tend to standardize the workplace. Across all students, the average union productivity advantage is 3 percent. *Ind. Lab. Relat. Rev.*, Apr. 1987, 40(3), pp. 354-63. University of Oregon.

Ellwood, David T. and Fine, Glenn—The Impact of Right-to-Work Laws on Union Organizing

Unlike most previous work, this paper examines the effect of right-to-work laws on flows into unionism through organizing rather than on the stock of unionism. Organizing offers a far more sensitive indicator of the situation of unionism and allows the use of both cross-sectional and time-series methods to explore the impact of the passage of a right-to-work law. The authors find that right-to-work laws have a sizable initial impact on organizing that decays over time. The effect holds up even when one uses fixed weights and causality tests. *J. Polit. Econ.*, Apr. 1987, 95(2), pp. 250-73. Harvard University; Department of Justice.

**Hoyman, Michele M. and Stallworth, Lammont**—Participation in Local Unions: A Comparison of Black and White Members

This article compares the participation of black and white union members in their local unions. Using more detailed measures of union participation than those employed in earlier studies, and focusing on members, not just leaders, the authors find little difference between blacks and whites. This surprising result which contradicts previous studies showing less participation by blacks, holds even with controls for gender, salary, education, number of years' memberships, the presence of friends in the union, the strength of a sense of efficacy, confidence in the ability to gain local union office, and the liberalness of attitudes about civil rights. *Ind. Lab. Relat. Rev.*, Apr. 1987, 40(3), pp. 323-35. University of Missouri, St. Louis; Loyola University.

**Knight, Thomas R.**—Tactical Use of the Union's Duty of Fair Representation: An Empirical Analysis

This paper presents the first empirical analysis of complainant behavior under the duty of fair representation. To partly explain the growth in fair representation cases, the author hypothesizes that some workers file representation complaints for tactical purposes—to acquire bargaining power in the grievance process or inflict political damage on incumbent union officers. The distribution of complaints and complaint outcomes across individuals and locals of one international union in British Columbia during 1975-83 supports the hypothesis. The author concludes that these results raise serious questions about the impact of the fair representation doctrine on unions' effectiveness as bargaining agents. *Ind. Lab. Relat. Rev.*, Jan. 1987, 40(2), pp. 180-94. University of British Columbia.

**Manning, Alan**—An Integration of Trade Union Models in a Sequential Bargaining Framework

This paper aims to embed two popular models of trade union behavior, the monopoly model and the efficient bargaining model, in a more general framework. It does this by analyzing sequential bargaining models where wages

are determined before employment and the power of the union in the two stages of the bargain differs. As well as finding that the monopoly and efficient bargain models are special cases of this model, a new class of models is also discovered. This framework is used to analyze the relationship between union power and efficiency, the empirical analysis of trade unions, and the effects of trade union legislation. *Econ. J.*, Mar. 1987, 97(385), pp. 121-39. Birkbeck College, London.

**Maranto, Cheryl L. and Fiorito, Jack**—The Effect of Union Characteristics on the Outcome of NLRB Certification Elections

This paper examines the determinants of NLRB certification election outcomes in individual election units between 1972 and 1980. Particular emphasis is given to the role of national union characteristics in determining union success or failure. The authors find that union success in organizing both blue- and white-collar workers is influenced positively by union size and internal democracy and negatively by strike activity and the centralization of its decision making. Benefits provided directly to members by unions significantly increase, and higher dues significantly reduce, white-collar organizing success, whereas the same factors have no significant effect on blue-collar organizing. *Ind. Lab. Relat. Rev.*, Jan. 1987, 40(2), pp. 225-40. University of Iowa.

**Masters, Marick F. and Delaney, John Thomas**—Union Political Activities: A Review of the Empirical Literature

The authors find that empirical research on unions' political activity since World War II has failed to answer many important questions. Not only have researchers neglected some issues outright, but disparate data sources and statistical methods, lack of a guiding theory, inconsistent findings, and hidden normative assumptions limit the generalizability of reported results. The review nevertheless confirms that union members and leaders often differ in political orientation, though the extent of disagreement varies across political issues. Also, unions apparently have been more successful at achieving political objectives only weakly supported by their members than at achieving the objec-

tives their members strongly support. *Ind. Lab. Relat. Rev.*, Apr. 1987, 40(3), pp. 336-53. University of Pittsburgh; Columbia University.

**Mefford, Robert N.**—The Effect of Unions on Productivity in a Multinational Manufacturing Firm

This paper examines unions' effect on productivity in thirty-one plants of a multinational firm in 1975-82. The plants, 60 percent of them unionized, all used material-intensive, labor-intensive, low-technology methods. Estimation of a translog production function shows that unionization's overall effect on productivity was positive. Specific findings are that unionization increased the capital-labor ratio and improved management performance but also raised the absenteeism rate. Because a net positive effect on productivity remains even when these channels of union influence are controlled for, the author suggests that unionization may improve the labor relations climate or labor quality. *Ind. Lab. Relat. Rev.*, Oct. 1986, 40(1), pp. 105-14. University of San Francisco.

**Mishel, Lawrence**—The Structural Determinants of Union Bargaining Power

This paper investigates the structural determinants of variation in union power across manufacturing industries. Using a pooled sample of unionized establishments from the Expenditure on Employee Compensation Surveys of 1968-72, the author estimates wage equations augmented with measures of product market structure, bargaining structure, and the size distribution of unions. The results suggest that union wage gains are greatest where discretionary pricing power enhances employers' ability to pay and where unions achieve high coverage, practice centralized bargaining, and avoid union fragmentation. On the other hand, centralized bargaining provides no advantage in competitive industries. *Ind. Lab. Relat. Rev.*, Oct. 1986, 40(1), pp. 90-104. Industrial Union Department, AFL-CIO.

**Schwochau, Susan**—Union Effects on Job Attitudes

This paper examines differences in the reported job satisfaction of union members and nonmembers using a multiple equation model

that treats union membership, wage rates, and reported satisfaction as endogenously determined. The result indicates that union members differ from nonmembers in how they assess their satisfaction with supervision, coworkers, and job content. Consistent with prior research, union members are found to report lower levels of satisfaction than nonmembers. Analyses of the effects of employer tenure and grievance procedures use lend only partial support to the "exit-voice" hypothesis as an explanation for these findings. *Ind. Lab. Relat. Rev.*, Jan. 1987, 40(2), pp. 209-24. State University of New York, Buffalo.

**Stewart, Mark B.**—Collective Bargaining Arrangements, Closed Shops and Relative Pay

This paper uses establishment-level data to examine the impact on union/nonunion pay differentials of the industrial relations setting in which bargaining takes place. The pre-entry closed shop is found to be of prime importance for the pay of both skilled and semiskilled manual workers. For skilled workers, and for semiskilled workers in larger establishments, the differentials are found to be insignificantly different from zero in the absence of a pre-entry closed shop. *Econ. J.*, Mar. 1987, 97(385), pp. 140-56. University of Warwick.

### 832 Collective Bargaining

**Becker, Brian E.**—Concession Bargaining: The Impact on Shareholders' Equity

This analysis of bargaining settlements in 1982-83 shows that, on average, shareholders in those firms that negotiated concessionary settlements enjoyed an 8 to 10 percent increase in the value of their holdings. The author interprets this result to mean not that the value of the firm increased, but rather that concessions enlarged the shareholders' portion of the firm's value at the expense of the workers' portion. On the other hand, concession bargaining does not seem to have reallocated business risk between shareholders and labor. *Ind. Lab. Relat. Rev.*, Jan. 1987, 40(2), pp. 268-79. State University of New York, Buffalo.

**Bloom, David E.**—Empirical Models of Arbitrator Behavior under Conventional Arbitration

Analysis of a new set of data indicates that conventional arbitrators tend to mechanically compromise between the parties' final offers with virtually no evidence of systematic reference to the facts of the cases. However, since there is a substantial amount of unexplained variance in the arbitrators' decisions, this evidence of mechanical compromise behavior should be viewed as characterizing the overall operation of conventional arbitration mechanisms and not the behavior of individual arbitrators in any particular case. Indeed, the results are consistent with the view that individual arbitrators pay close attention to the facts of the cases, but that there is considerable variation in the structure of different arbitrators' preference functions. *Rev. Econ. Statist.*, Nov. 1986, 68(4), pp. 578-85. Harvard University and National Bureau of Economic Research.

**Carter, Colin, et al.—Agricultural Labor Strikes and Farmers' Income**

This paper assesses the effectiveness of union strikes against agricultural industries. Various factors, including input substitution possibilities, create special challenges for union leaders. The authors develop the concept to a minimum-effective union and apply it empirically to the 1979 California lettuce strike. To be effective, a union has to reduce producer profits below the prestrike level. In the lettuce strike case, producer profits were actually increased, not reduced. Coauthors are Darrell L. Hueth, John Mamer, and Andrew Schmitz. *Econ. Inquiry*, Jan. 1987, 25(1), pp. 121-33. University of California, Davis.

**Gramm, Cynthia L.—New Measures of the Propensity to Strike during Contract Negotiations, 1971-1980**

This paper presents new measures—by month, industry, and union—of the percentage of labor contract negotiations in the United States that result in a strike. The measures are derived from a single, comprehensive sample of 6,046 contract negotiations occurring in 1971-80 in bargaining units of 1,000 or more workers. These data are superior to those used in previous studies because they measure strike probabilities (or propensities) directly rather than by proxy. The data show that strikes oc-

curred in 13.25 percent of all negotiations analyzed, but this strike rate varied substantially across years, industries, and unions. *Ind. Lab. Relat. Rev.*, Apr. 1987, 40(3), pp. 406-17. Cornell University.

**Gunderson, Morley and Melino, Angelo—Estimating Strike Effects in a General Model Prices and Quantities**

Estimates of the effect of strikes on the production, price, and purchases of North American automobiles are provided over the period 1966-79. The estimates are based on a model that reflects the decisions of both consumer and producers, and captures important intertemporal adjustments to allow for inventory buildup in anticipation of inventory depletion during, and replacements after, a strike. The results indicate that consumers and producers rationally responded to the strike through a variety of related intertemporal adjustment and while the initial effects can be quite pronounced, the long-run effects are usually minimal. *J. Lab. Econ.*, Jan. 1987, 5(1), pp. 1-18. University of Toronto.

**Lee, Barbara A. and Parker, Joan—Supervisory Participation in Professional Associations: Implications of *North Shore University Hospital***

In *NLRB v. North Shore University Hospital* a circuit court prohibited a professional association from serving as a collective bargaining agent of a unit of registered nurses because the court found that statutory supervisors participated in the association's governance. Here the authors analyze the relevant case law; discuss earlier nursing representation cases; describe the responses of nurses' professional associations to *North Shore* in three states; and discuss the implications of *North Shore* and related decisions. They also propose an analytical model for the NLRB to follow in assessing the extent and seriousness of supervisory participation in a professional association. *Ind. Lab. Relat. Rev.*, Apr. 1987, 40(3), pp. 364-81. Rutgers University.

**Leeds, Michael A.—Bargaining as Search Behavior under Mutual Uncertainty**

This paper views bargaining as a bilateral search process conducted by rational but in-

completely informed agents. It is shown that one cannot generally predict how acceptable wages or wage proposals move during the course of a strike. The role of information and mechanisms that convey it are examined. The observation that wage proposals do converge is shown to be the result of exhaustible buffers that temporarily protect the bargaining agents. *Southern Econ. J.*, Jan. 1987, 53(3), pp. 677-84. Temple University.

**Rose, Joseph B.**—Legislative Support For Multi-Employer Bargaining: The Canadian Experience

This study appraises the laws adopted in the 1970s by most provinces in Canada for the purpose of promoting stronger employer associations and broader bargaining structures in the construction industry. The author finds that employer associations in construction are now more cohesive and less vulnerable to union whipsaw and leapfrog tactics, and the frequency of construction strikes has declined. On the other hand, other measures of strike activity, such as total days lost, increased following the legislative changes, and construction wages continued to rise as rapidly as in the late 1960s. *Ind. Lab. Relat. Rev.*, Oct. 1986, 40(1), pp. 3-18. McMaster University.

**Ruben, George**—Labor-Management Scene in 1986 Reflects Continuing Difficulties

This annual article discusses the 1986 labor contract settlements in private industry and federal, state, and local bargaining units of 1,000 workers or more. The focus of negotiations was on meeting competition, especially from foreign firms, in manufacturing, and from domestic firms in construction, telecommunications, and transportation. Bargainers concentrated on ways to restrain labor costs, increase productivity, and preserve jobs. New approaches emerged, and longstanding bargaining patterns disappeared as both labor and management sought to adjust to the shifting conditions in all forms of economic activity, ranging from individual plants to entire industries. *Mon. Lab. Rev.*, Jan. 1987, 110(1), pp. 37-48. Bureau of Labor Statistics.

**Sockell, Donna**—The Scope of Mandatory Bargaining: A Critique and a Proposal

This paper argues that the mandatory-permissive distinction in the scope of the duty to bargain collectively should give way to a policy of classifying all lawful subjects as mandatory. The author shows that in recent applications of the distinction, many subjects of interest to labor have been declared exclusively within management's control. She argues that the rationales used by the NLRB and the courts in these decisions are not compelling, and the mandatory-permissive distinction is even less convincing when its current application is compared to the criteria of an ideal scope of bargaining. *Ind. Lab. Relat. Rev.*, Oct. 1986, 40(1), pp. 19-34. Columbia University.

### 833 Labor-Management Relations

**Doeringer, Peter B.; Moss, Philip I. and Terkla, David G.**—Capitalism and Kinship: Do Institutions Matter in the Labor Market?

This study examines the determination of employment and pay on "capitalist" and "kinship" vessels in the New England fishing industry. Capitalist vessels resemble standard competitive firms in the way that employment and pay respond to changing market conditions; kinship vessels operate under work guarantees and income sharing rules. These differences in institutional rules lead to different patterns of income, employment, growth, and labor adjustment. The study shows how an understanding of the institutional structure of labor markets can contribute to the design of public policies to facilitate adjustments to change and to promote industrial growth. *Ind. Lab. Relat. Rev.*, Oct. 1986, 40(1), pp. 48-60. Boston University; University of Lowell and Institute for Employment Policy, Boston University; Boston University.

**Héthy, Lajos**—New Developments in Collective Forms of Work Organisation in Socialist Countries

New forms of collective work organization in Eastern Europe are rapidly gaining ground as increased stress is laid on material incentives in an effort to improve labor productivity and enterprise efficiency. In Czechoslovakia and the U.S.S.R., new-style brigades have created an additional source of income for their members and the growing practice of differential wage

distribution geared to performance has proved popular with the workers. In Hungary, semi-autonomous "work communities" within the enterprises have devised innovative approaches to production and incentives. In discussing the background and determinants of these developments, the differing perceptions of group work, and the relative merits of centralized and decentralized methods of regulation, the author gives a critical appraisal of the results achieved. *Int. Lab. Rev.*, Nov.-Dec. 1986, 125(6), pp. 659-74. Institute of Labor Research, Hungarian State Office for Labour and Wages, Budapest.

**Voos, Paula B.**—Managerial Perceptions of the Economic Impact of Labor Relations Programs

Managers of unionized Wisconsin firms were surveyed in 1984 concerning their companies' experiences with gainsharing programs, profit-sharing plans, employee stock-ownership plans, employee participation programs, joint union-management committees at the plant level, and community-wide union-management cooperation committees. Managers assessed gainsharing, profit-sharing, and participation programs as improving company performance more than the other types of programs. The local community cooperation committees were perceived as having no effect on firm performance. *Ind. Lab. Relat. Rev.*, Jan. 1987, 40(2), pp. 195-208. University of Wisconsin.

#### 840 DEMOGRAPHIC ECONOMICS

##### 841 Demographic Economics

**Abeyasinghe, Tilek**—Rising Needs and Falling Family Size: Implications from Marx on Demographic Transition

Marx's views of population growth and wage labor provides a useful framework to investigate the fertility decline experienced by the industrial world in an era of rising per capita incomes. It is argued here that the persistent increase in "social needs" (including skill needs) has compelled families to reduce their size by reducing the number of surviving children borne. This is viewed as a survival strategy adopted by individual families in place of direct and organized struggle for higher wages. *Rev. Soc. Econ.*, Dec. 1986, 44(3), pp. 281-93. University of Manitoba.

**Becker, Gary S. and Tomes, Nigel**—Human Capital and the Rise and Fall of Families

This paper develops a model of the transmission of earnings, assets, and consumption from parents to descendants. The model assumes utility-maximizing parents who are concerned about the welfare of their children. The degree of intergenerational mobility is determined by the interaction of this utility-maximizing behavior with investment and consumption opportunities in different generations and with different kinds of luck. The authors examine a number of empirical studies for different countries. Regression to the mean in earnings in rich countries appears to be rapid. Almost all the earnings advantages or disadvantages of ancestors are wiped out in three generations. *J. Lab. Econ.*, Pt. 2, July 1986, 4(3), pp. S1-39. University of Chicago and National Opinion Research Centre; University of Western Ontario and National Opinion Research Centre.

**Behrman, Jere R. and Taubman, Paul**—Birth Order, Schooling, and Earnings

Birth-order effects are posited by many to affect earnings and schooling. The authors show how such effects can be interpreted to shift either the earnings possibility frontier for siblings or parental preferences. The authors find empirical evidence for birth-order effects on (age-adjusted) schooling and on earnings for young U.S. adults, though the latter is not robust for all specifications. The examination of intra-household allocations suggests that these birth-order differences occur, despite parental preferences or prices, by birth order favoring later-borns, apparently because of stronger endowment effects that favor firstborns. *J. Lab. Econ.*, Pt. 2, July 1986, 4(3), pp. S121-45. University of Pennsylvania.

**Hauser, Robert M. and Sewell, William H.**—Family Effects in Simple Models of Education, Occupational Status, and Earnings: Findings from the Wisconsin and Kalamazoo Studies

Among fraternal pairs from the Wisconsin Longitudinal Study (1980), the authors model the effects of measured and unmeasured family background factors, mental ability, and schooling on occupational status and earnings. The

models are estimated from incomplete data with corrections for measurement error, and they permit direct comparisons of within- and between-family regressions. The authors find no evidence that the effects of family background lead to a bias in the effect of mental ability on schooling or in the effects of schooling on occupational status or earnings. *J. Lab. Econ.*, Pt. 2, July 1986, 4(3), pp. S83-115. University of Wisconsin.

**Kearl, J. R. and Pope, Clayne L.**—Unobservable Family and Individual Contributions to the Distributions of Income and Wealth

This paper uses combinations of full brothers, half brothers, and fathers and sons to measure the effect of common family background on a household's income and wealth. Intraclass correlations of half brothers, compared to those for full brothers, suggest that fathers play a dominant role in the transmission of the common family effect. When unobserved background is decomposed into individual and family effects, the individual effect dominates the family effect for income, while the family effect dominates the individual effect for wealth. *J. Lab. Econ.*, Pt. 2, July 1986, 4(3), pp. S48-79. Brigham Young University and National Bureau of Economic Research.

**Keeley, Michael C.**—The Effects of Experimental Negative Income Tax Programs on Marital Dissolution: Evidence from the Seattle and Denver Income Maintenance Experiments

This paper analyzes the effects of Negative Income Tax (NIT) Programs on marital stability. A household production model is used to show that the rate of marital dissolution should depend negatively on the increase in nonlabor income and positively on the decrease in the net (of tax) wage that is caused by an NIT. These hypotheses are tested employing an experimental impact model that uses data from the Seattle and Denver Income Maintenance Experiments. The empirical findings suggest that the rate of marital dissolution is sensitive to these parameters in a manner consistent with the hypotheses. *Int. Econ. Rev.*, Feb. 1987, 28(1), pp. 241-57. Federal Reserve Bank of San Francisco.

**Lam, David**—The Dynamics of Population Growth, Differential Fertility, and Inequality

This paper analyzes the effects of income differentials in fertility on Lorenz curves and standard inequality measures. The role of intergenerational mobility is examined and incorporated into counterfactual simulations based on Brazilian data. Two standard inequality measures move in opposite directions in both the steady state and the transition in response to the elimination of fertility differentials. The counterfactuals confirm the theoretical predictions of misleading intertemporal inequality comparisons in the presence of differential fertility. *Amer. Econ. Rev.*, Dec. 1986, 76(5), pp. 1103-16. University of Michigan.

**Schultz, Theodore W.**—The Changing Economy and the Family

The reasons why the family is not fading away as an economic entity are discussed. The economic approach should be extended to deal with the effects of the life-span revolution; large secular shifts in relative prices and commodities, durables, and services; changes in income components; and entrepreneurial ability of the family. What families do in distributing their endowments has less effect on the personal distribution of endowments than have general increases in real per capita incomes, changes in the composition of income, and the increases in the ratio of income derived from human capital relative to that derived from property. *J. Lab. Econ.*, Pt. 2, July 1986, 4(3), pp. S278-87. University of Chicago.

#### 850 HUMAN CAPITAL; VALUE OF HUMAN LIFE

##### 851 Human Capital; Value of Human Life

**Catsiapis, George**—A Model of Educational Investment Decisions

From a probit model of enrollments, estimates of the expected net present value of post-secondary education are developed for a sample of high school graduates, based exclusively on individual expectations of the relevant costs and benefits at the time of the enrollment decision. The results are very plausible and consistent with rate-of-return estimates from studies which rely on *ex post* income data. This suggests that students have rational expectations and relatively good information about future employ-

ment opportunities and other factors which determine the returns to educational investment. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 33-41. New York University.

**Cohn, Elchanan and Kiker, B. F.**—Socioeconomic Background, Schooling, Experience and Monetary Rewards in the United States

Using a selective sample from the 1977 Panel Study of Income Dynamics, the authors investigate the relations among schooling, job experience, socioeconomic status (SES), IQ, and earnings in the United States. In contrast to the results for the United Kingdom reported by John Papanicolaou and George Psacharopoulos, we find no interaction effect on earnings between schooling and SES. A positive interaction effect on earnings, however, is found between experience and SES. Introducing IQ in the analysis leaves the above-mentioned results unchanged. It is argued that differences between the U.S. and the U.K. might be due to cultural and labor-market factors. *Economica*, Nov. 1986, 53(212), pp. 497-503. University of South Carolina.

**Conlisk, John**—Notes on Mincer's Log-Earnings Model

In his famous human capital model, Jacob Mincer provides assumptions under which a worker's annual log-earnings are a function of years of schooling and years of experience. The function has the important property, widely invoked in empirical studies, that its derivative with respect to schooling equals the rate of return to the schooling investment. It is shown here that some of Mincer's assumptions are not needed for the property to hold, but that other assumptions carry troublesome hidden implications. *Econ. Inquiry*, Jan. 1987, 25(1), pp. 165-74. University of California, San Diego.

**Prais, S. J.**—Educating for Productivity: Comparisons of Japanese and English Schooling and Vocational Preparation

The high technical quality and reliability of Japanese manufactures raises questions of how the training and education of their workforce differs from Britain's. The standards reached by Japanese 15-18 year-olds in their technical and vocational secondary schools—and the

number of pupils reaching them—are described in this paper and compared with Britain, as well as the standards reached in mathematics during compulsory schooling until 15. This paper follows earlier studies of German and French schooling and vocational preparation (see National Institute Economic Review, August 1983, February and May 1985, and May 1986). *Nat. Inst. Econ. Rev.*, Feb. 1987, (119), pp. 40-56. National Institute of Economic and Social Research, London.

**Rumberger, Russell W.**—The Impact of Surplus Schooling on Productivity and Earnings

This article examines the impact of surplus schooling on individual productivity and earnings, proposing a model that divides workers' education into two components: education that is required and thus fully utilized in the job, and education that exceeds the amount required and may be underutilized in the job. It tests the model with data from the Quality of Working Life Surveys and estimates required schooling from estimates by job incumbents and the *Dictionary of Occupational Titles*. The results show that surplus education is rewarded at a lower rate than required education, with the return dependent on the type of job. *J. Hum. Res.*, Winter 1987, 22(1), pp. 24-50. Stanford University.

## 900 Welfare Programs; Consumer Economics; Urban and Regional Economics

### 910 WELFARE, HEALTH, AND EDUCATION

#### 911 General Welfare Programs

**Moffitt, Robert**—Historical Growth in Participation in Aid to Families with Dependent Children: Was There a Structural Shift?

The dramatic increase in the growth rate of the caseload of the U.S. Aid to Families with Dependent Children program in the late 1960s and early 1970s—commonly called the "welfare explosion"—is examined. An analysis of the time-series and cross-section data indicates that changes in neither benefit levels, labor market conditions, nor characteristics of recipients can explain the explosion; hence there was a "structural shift." It is speculated that the explosion resulted from reductions in the stigma of wel-

fare receipt and from eased eligibility restrictions. *J. Post Keynesian Econ.*, Spring 1987, 9(3), pp. 347-63. Brown University.

**Plotnick, Robert D.—An Interest Group Model of Direct Income Redistribution**

An interest group model of the determinants of policies which directly redistribute income to low income persons is developed and tested. The model assumes that altruistic taxpayers, nonaltruistic taxpayers, and needy beneficiaries form separate interest groups from which politicians seek support. Benefit levels depend on variables such as taxpayer income and the price of benefits but, unlike median voter models, the model also implies a role for interest group strength and competition between political parties. The author uses latent variable methods and data on the Aid to Families with Dependent Children program to demonstrate empirical support for the model. *Rev. Econ. Statist.*, Nov. 1986, 68(4), pp. 594-602. University of Washington.

**913 Economics of Health (including medical subsidy programs)**

**Branch, E. Raphael—Comparing Medical Care Expenditures of Two Diverse U.S. Data Sources**

This article examines the cost of health care to consumers, exclusive of financing by other parties—referred to as direct payments for personal health care or out-of-pocket expenditures or medical care. As part of the evaluation process, data from the BLS Consumer Expenditure Survey (CE) are compared with those from the National Health Accounts (NHA). The CE and the NHA are constructed for different purposes and, hence, use different estimation methods. The CE focuses on family spending and is the major source for out-of-pocket data by demographic groups. The NHA focuses on national aggregate expenditures for all health care by categories and sources of financing. *Mon. Lab. Rev.*, Mar. 1987, 110(3), pp. 15-18. Bureau of Labor Statistics.

**Dauley, Stephen Day—The Time Price of Medical Care**

An econometric model is used to impute the value of time in the demand for medical care

for members of a prepaid group practice medical care program. Separate estimates are obtained for: (1) individuals who were employed full time, (2) housewives, and (3) time associated with taking children to a doctor. For individuals who were employed full time, the estimate was close to the median wage rate. Sick leave was estimated to substantially reduce the value of time. It was concluded that ignoring the time price of medical care may result in misleading statistical analysis and mistaken policy recommendations. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 59-66. Seaver College, Pepperdine University.

**Lamberton, C. E.; Ellingson, W. D. and Spear, K. R.—Factors Determining the Demand for Nursing Home Services**

Private and Medicaid supported demands for nursing home use in a rural state were estimated using need as well as economic variables. Economic variables were significant only in the private demand market, which was found to be price inelastic. Income elasticity was unitary. Need variables such as access to physician services or home health visits were significant in both markets. Medicaid supported demand was greater in more rural areas. The models also suggest that continued urbanization and retention of population will tend to reduce demand for nursing home services in a rural state. *Quart. Rev. Econ. Bus.*, Winter 1986, 26(4), pp. 74-90. South Dakota State University; South Dakota State University; North American Equitable Life Assurance.

**Peltzman, Sam—Regulation and Health: The Case of Mandatory Prescriptions and an Extension**

The effect of requiring consumers to obtain prescriptions for pharmaceuticals is examined for a sample of middle-income countries. In countries enforcing the requirement, infectious disease mortality is no lower and poisoning mortality is higher than in those not enforcing the requirement. A broader measure of government intervention, public expenditures on health relative to GDP, is shown to have moderately adverse effects on overall life expectancy. *Managerial Dec. Econ.*, Mar. 1987, 8(1), pp. 41-46. University of Chicago.

**Yeas, Martynas A.**—Recent Trends in Health near the Age of Retirement: New Findings from the Health Interview Survey

This article examines whether, as assumed, an increase in life expectancy should be accompanied by increasing age-specific health rates. A review of the literature shows that the health changes to be expected from the recent mortality decline are unclear. Data are examined for groups aged 62–67 and 55–70 in the period 1969–81. A variety of measures of limitation, medical care utilization, and subjective health showed similar trends. Health generally declined during the first part of the period, but the trend, if any, was much less clear for more recent years. However, simple linear projections of health status change may be misleading. *Soc. Sec. Bull.*, Feb. 1987, 50(2), pp. 5–30. Social Security Administration.

#### 915 Social Security

**Cox, J. P.**—Economic Growth and Income Support Policy in Australia

This paper examines the growth in welfare spending in Australia over the 20 years from the early 1960s to the early 1980s. The levels of benefit and high tax rates implicit in the tax and social security systems are shown to create disincentives over wide ranges of private income. More generous levels of benefits had a modest but significant part in the growth of unemployment since 1970. The efficiency costs of meeting society's distributional objectives can be minimized by targeting assistance to the most needy and by the careful use of income testing. *Econ. Rec.*, Sept. 1986, 62(178), pp. 268–85. Economic Planning Advisory Council, Canberra, Australia.

**Lopez, Eduard A.**—Constitutional Background to the Social Security Act of 1935

The Social Security Act contained provisions to help those persons most affected by the Great Depression—a national old-age insurance program for the elderly and a system of nationally uniform State unemployment programs for those without jobs. Although the Act was passed by overwhelming majorities in both Houses of Congress, there was concern that the Supreme Court would declare the programs unconstitu-

tional. This article discusses the social security cases and the issues that preceded the Court's decision to uphold those provisions. It gives an overview of the constitutional background to the Social Security Act of 1935. *Soc. Sec. Bull.*, Jan. 1987, 50(1), pp. 5–11. Social Security Administration.

**Packard, Michael D.**—Income of New Disabled-Worker Beneficiaries and Their Families: Findings from the New Beneficiary Survey

According to the Social Security Administration's New Beneficiary Survey, the 1982 median monthly incomes of disabled workers who came on the social security disability rolls from mid-1980 to mid-1981 were less than \$500 if they were unmarried and less than \$1,300 if they were married. Social security benefits were the most important source of income for disabled workers and their families, accounting for 40 percent of total family income of married disabled workers and 65 percent of income for the unmarried. Earnings accounted for 28 percent of income for married disabled-worker beneficiaries, but only about 3 percent for the unmarried. *Soc. Sec. Bull.*, Mar. 1987, 50(3), pp. 5–23. Social Security Administration.

**Rocklin, Sarah G. and Mattson, David R.**—The Employment Opportunities for Disabled Americans Act: Legislative History and Summary of Provisions

This article describes the legislative history of the Employment Opportunities for Disabled Americans Act and contains a summary of the provisions of the new law. The intent of this legislation is to enhance the work incentives for the disabled and blind under the supplemental security income (SSI) law. The law makes permanent and improves section 1619 of the Social Security Act, provisions that were enacted as a temporary demonstration project in 1980. These provisions encourage disabled and blind individuals who are eligible for SSI benefits to make work attempts by providing special SSI payments and Medicaid coverage while they do so. *Soc. Sec. Bull.*, Mar. 1987, 50(3), pp. 25–35. Social Security Administration.

916 *Economics of Law and Crime*

Centner, Terence J. and Wetzstein, Michael E.—Reducing Moral Hazard Associated with Implied Warranties of Animal Health

Implied warranties convey information regarding animal health to livestock buyers. Statutory implied warranties also include insurance coverage for a warranty breach which removes buyers' incentives to mitigate possible damages when a warranty is breached. Nonmitigation of damages created the problem of moral hazard, which led livestock sellers to seek legislative exemptions abrogating implied warranties. A theoretical analysis of the possible inefficiencies associated with legislative exemptions adopted by twenty-five states is provided, and partial insurance is suggested as an alternative to the legislative shift in liability. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 143-50. University of Georgia.

Lang, Kevin and Bell, Duran—An Economic Model of the Intake Disposition of Juvenile Offenders

In Becker's model, punishment is not constrained by a normative "socially acceptable" level. Roy Carr-Hill and Nicholas Stern (1979) show that the justice system requires a concept of "appropriate" punishment which places either an upper bound on punishment or a cost of deviating from the "appropriate" penalty. The authors estimate the social loss function implicitly minimized by police intake officers' processing of juvenile offenders. The calculation of social cost appears to ignore both the private costs of punishment and the seriousness of the crime. This suggests that concepts of rights and appropriate penalties affect decisions and provide a nonbinding upper bound on punishment. *J. Public Econ.*, Feb. 1987, 32(1), pp. 79-99. University of California, Irvine.

Viscusi, W. Kip—The Risks and Rewards of Criminal Activity: A Comprehensive Test of Criminal Deterrence

Whereas previous analyses of criminal deterrence have focused on the effect of criminal enforcement on crime rates, this study analyzes the existence of compensating differentials for criminal pursuits. Analyzing the risk-rewards trade-off, this approach represents a more comprehensive test of the criminal deterrence hy-

pothesis. The sample consisted of black inner-city youths who reported their participation, income, and self-assessed risks from crime. The risk premiums for the three principal adverse outcomes (arrest, conviction, and prison) constituted between one-half and two-thirds of all crime income on the average, providing strong support for the criminal deterrence hypothesis. *J. Lab. Econ.*, Pt. 1, July 1986, 4(3), pp. 317-40. Northwestern University and National Bureau of Economic Research.

917 *Economics of Minorities; Economics of Discrimination*

Corcoran, Mary E. and Courant, Paul N.—Sex-Role Socialization and Occupational Segregation: An Exploratory Investigation

This paper explores the possibility that differences in the pre-labor market treatment of men and women (boys and girls) may lead to differences in tastes and talents at the level of the labor market, thus accounting for some of the unexplained gap between male and female earnings. Three examples of such phenomena are explored, and in all three cases the results tend to confirm the basic idea that sex-differences in characteristics that are relevant in the labor market arise in part from socialization and training of boys and girls that is oriented towards maintenance of traditional sex roles. *J. Post Keynesian Econ.*, Spring 1987, 9(3), pp. 330-46. University of Michigan.

Datcher-Loury, Linda—Racial Differences in the Stability of High Earnings among Young Men

The proposition that there is a large and growing black middle class is a major tenet of much recent work on black economic progress. This paper examines one aspect of middle-class status for black families, namely, the stability of high earnings among young male household heads. It finds that while such men are much less likely to have high earnings than are their white counterparts, there are only small racial differences in the stability of high earnings over time. *J. Lab. Econ.*, Pt. 1, July 1986, 4(3), pp. 301-16. Tufts University.

Fischer, Charles C.—Toward a More Complete Understanding of Occupational Sex Discrimination

Institutional theories of occupational sex discrimination are methodologically superior to other such theories. The institutional methodology is well suited for exploring questions critical to occupational sex discrimination, which other theories beg: the dynamic feedback relationships among the sources of occupational sex discrimination, the ways in which individuals interact with their environment, and the cultural foundations of male-female socioeconomic distinctions. Yet, there are parts of this puzzle that none of our theories explain. An interdisciplinary approach is needed. Institutionalism, with its emphasis on interactive open systems analysis, is well suited for taking the lead in the development of an integrative model of occupational sex discrimination. *J. Econ. Issues*, Mar. 1987, 21(1), pp. 113-38. Pittsburg State University, Kansas.

**Williams, Walter E.**—How Business Transcends Politics

The paper states the importance of the free market in combating racial prejudice through the ability to offer compensating price differentials. As such, required withdrawal of U.S. firms from South Africa would have a negative effect on race relations in South African workplaces. *Managerial Dec. Econ.*, Mar. 1987, 8(1), pp. 15-20. George Mason University.

**Yinger, John**—Measuring Racial Discrimination with Fair Housing Audits: Caught in the Act

A survey technique called a "fair housing audit" provides a direct measure of racial discrimination in housing. This paper examines the econometric issues raised by audit data, measures the discrimination uncovered by a 1981 Boston study, and tests hypotheses about the causes of discrimination. The estimated level of discrimination is high: Black housing seekers are told about 30 percent fewer available housing units than are whites. The hypothesis tests indicate that the primary cause of this discrimination is that housing agents illegally promote their economic interests by catering to the racial prejudice of their current or potential white customers. *Amer. Econ. Rev.*, Dec. 1986, 76(5), pp. 881-93. Syracuse University.

## 920 CONSUMER ECONOMICS

**921 Consumer Economics; Levels and Standards of Living**

**Alcorno, Eduard A. and Johnson, Lester W.**—An Alternative Approach to the Specification of Approximate Demand Systems

A new methodology is proposed that can be used to derive approximate demand systems with more advantageous properties than those currently available, e.g., the basic Rotterdam model. It provides a solution to the problems caused by the Rotterdam fixed coefficient parameterization and introduces a model with clearly defined aggregation properties. Preliminary results of an empirical test of the model, using well documented alcohol demand data, suggests that further work on the new model is warranted. *Australian Econ. Pap.*, Dec. 1985, 24(45), pp. 380-93. Macquarie University.

**Bewley, Ronald and Young, Trevor**—Applying Theil's Multinomial Extension of the Linear Logit Model to Meat Expenditure Data

One of the chief drawbacks of the multinomial extension of the linear logit model is that, after the standard linearization, the parameters which are directly estimated have no obvious economic meaning. This paper presents alternative transformations which facilitate interpretation. In one linearization the estimated coefficients will be elasticities at a selected data point such as the mean. In another form, the coefficients will be Slutsky parameters. The latter version is chosen for an empirical analysis of the demand for meat in Great Britain. A number of issues concerning the model's error structure and dynamic specification are discussed. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 151-57. University of New South Wales; University of Manchester.

**Coondoo, Dipankor and Majumder, Amita**—A System of Demand Equations Based on Price Independent Generalized Linearity

This paper proposes a static demand system of the Price Independent Generalized Linearity (PIGL) class of J. Muellbauer. The primary motivation for this is to use the plausible nonlinear income responses displayed by the PIGL in empirical analysis. The performance of the pro-

posed system is compared empirically with those of the Almost Ideal Demand System and a modification of the simple Nonadditive model of A. S. Deaton. The results bring out the inadequacies of the PIGL specifications in capturing fully the nonlinearity of income responses implicit in the repeated cross-sectional Indian consumption data used in the empirical work. *Int. Econ. Rev.*, Feb. 1987, 28(1), pp. 213-28. Indian Statistical Institute, Calcutta.

Cox, Thomas L. and Wohlgenant, Michael K.—Prices and Quality Effects in Cross-sectional Demand Analysis

A conceptual clarification of the sources and meaning of cross-sectional price variability is used to motivate a theoretical and econometric framework for the estimation of cross-sectional demand functions. Quality effects are distinguished from supply-related price variability to identify cross-sectional demand for disaggregated food commodities. An empirical application using data from the 1977-78 Nationwide Food Consumption Survey indicates that parameter differences resulting from a failure to adjust cross-sectional prices for quality effects are likely to be small for relatively homogenous, disaggregated food commodities. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 908-19. University of Wisconsin; North Carolina State University.

Franklin, David L.; Harrell, Marlelouis W. and Leonard, Jerry B.—Income Effects of Donated Commodities in Rural Panama

Analyses of food expenditure data from rural households in Panama showed that the marginal propensity to consume food out of additional income in the form of donated food is not different than the marginal propensity to consume food out of money income for households participating in the Veraguas supplemental funding program. These results suggest that take-home food programs can have significant income-mediated impacts on the acquisition of food, and accordingly, food supplementation programs should be designed to maximize the income value of the donated commodities in terms of prices prevailing in the local markets. *Amer. J. Agr. Econ.*, Feb. 1987, 69(1), pp. 115-22. Sigma One Corporation, Raleigh, North Carolina.

Hamermesh, Daniel S. and Menchik, Paul L.—Planned and Unplanned Bequests

The authors distinguish between bequests that are planned as part of a lifetime optimization process and those that are the unplanned result of errors in forecasting the date of death. Given the initial endowment, a positive relation between the bequest and the planning horizon, and a negative relation between unexpectedly long life and the bequest is expected. A unique data set on wealthy decedents and their parents provides measures of expected horizons based on parents' longevity. Both predictions are confirmed, and there is an especially large and significant positive relation between the bequest and the length of the planning horizon. *Econ. Inquiry*, Jan. 1987, 25(1), pp. 55-66. Michigan State University.

Kokoski, Mary F.—An Empirical Analysis of Intertemporal and Demographic Variations in Consumer Preferences

Analysis of consumer demand behavior typically focuses on either the cross-sectional dimension or takes a time-series approach. The former ignores intertemporal changes in preferences, and the latter ignores differences in preferences among different groups of consumers. In this study two identically defined cross sections of expenditures data are used to estimate a nonhomothetic demand system for food at home for three demographic groups. The results indicate that both demographic and intertemporal differences in preferences are significant, and that the method of incorporating demographic variables into the estimation is also important. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 894-907. Bureau of Labor Statistics, Washington, D.C.

Kooreman, Peter and Kapteyn, Arie—A Disaggregated Analysis of the Allocation of Time within the Household

In this paper the authors estimate a model of the allocation of time within the household using data that allows them to distinguish between a large number of time uses. The model is explicitly derived within a utility maximization framework and can be estimated by relatively simple two-step estimation procedures. The model provides a natural framework to test

implications of the more restrictive models of Reuben Gronau (1977, 1980) and John Graham and Carole Green (1984). *J. Polit. Econ.*, Apr. 1987, 95(2), pp. 223-49. Tilburg University.

**Kotlikoff, Laurence J.; Shoven, John and Spivak, Avia**—The Effect of Annuity Insurance on Savings and Inequality

This paper examines the amount of precautionary savings and wealth inequality arising from life-span uncertainty by comparing saving behavior under perfect insurance arrangements with that arising under imperfect arrangements, namely, when longevity risk can be pooled only with members of one's own family. The central findings of the paper are: (1) perfecting insurance arrangements can lower savings in intergenerationally altruistic and life-cycle economies and (2) in altruistic economies perfecting annuity insurance can influence inequality; indeed, in the long run in the model, switching from imperfect family insurance to perfect insurance can mean the difference between absolute inequality and absolute equality. *J. Lab. Econ.*, Pt. 2, July 1986, 4(3), pp. S183-207. Boston University and National Bureau of Economic Research; Stanford University and National Bureau of Economic Research; Ben Gurion University, Israel.

**Mason, Charles and Butler, Clifford**—New Basket of Goods and Services Being Priced in Revised CPI

As part of the Consumer Price Index (CPI) revision, effective for January 1987 data, the market basket of goods and services priced for the measure has been updated to reflect changes in consumer spending. The revised CPI uses a market basket based on 1982-84 buying patterns. In addition, new definitions of some expenditure categories in the CPI are introduced. This article describes how the market basket is constructed and compares the new basket with the previous one (1972-73). Changes in consumption since the last revision are examined with respect to developments in prices, demographics, and other variables which may explain observed market basket differences. *Mon. Lab. Rev.* Jan. 1987, 110(1), pp. 3-22. Bureau of Labor Statistics.

**Pearce, I. F. and Thomas, S. H.**—Personal Savings and Transactions Balance Changes

In this paper the authors draw attention (1) to the role of contractual saving via life funds in the definition of personal savings and (2) to the appearance of transactions balance changes in recorded data when inflation is present. Using quarterly U.K. data for the period 1963-82, they estimate a simple model, which is both theory and data consistent: changes in noncontractual savings are dominated by transaction balance changes, and other economic variables that frequently appear in savings and consumption studies are found to be unimportant. *Manchester Sch. Econ. Soc. Stud.*, Dec. 1986, 54(4), pp. 380-90. University of Southampton, England.

**Pollak, Robert A. and Wales, Terence J.**—Pooling International Consumption Data

Pooling consumption data from different countries for demand system estimation is attractive because it increases both sample size and the range of variation of relative prices and income. The major objection to pooling is that different countries may have different demand system parameters. This paper proposed and estimates specifications that permit pooling while allowing both short-run and long-run demand systems to differ across countries. Using data from Belgium, the United Kingdom, and the United States, the authors find that, although pooling was accepted for some pairs of countries and some specifications, it was rejected for most. They conclude that caution is appropriate in pooling international consumption data. *Rev. Econ. Statist.*, Feb. 1987, 69(1), pp. 90-99. University of Pennsylvania; University of British Columbia.

**Senauer, Ben; Sahn, David and Alderman, Harold**—The Effect of the Value of Time on Food Consumption Patterns in Developing Countries: Evidence from Sri Lanka

This study shows that the opportunity cost of women's time can affect household food consumption patterns in developing countries. Demand equations for rice, bread, and the ratio of bread to total cereal consumption are estimated for urban Sri Lankan households. The demand specification, which is based on the

"New Household Economics," includes as explanatory variables the woman's estimated market wage and the household's "full income," and alternatively "observed income." Wages are estimated using the Heckman (1976) procedure to correct for sample selection bias. *Amer. J. Agr. Econ.*, Nov. 1986, 68(4), pp. 920-27. University of Minnesota; International Food Policy Research Institute, Washington, D.C.; International Food Policy Research Institute, Washington, D.C.

Smolensky, Eugene, et al.—An Application of a Dynamic Cost-of-Living Index to the Evaluation of Changes in Social Welfare

Increasing real income has not been accompanied by increasing public satisfaction. Simultaneously, there have been large unexplained shifts in demand functions which, when translated into a real welfare index, support the widely perceived malaise. Economists have not explained these shifts in demand patterns, hence there is no explanation of the malaise. This paper offers some conjectures, which can be tested using more comprehensive real income measures. Empirical estimations of a complete demand system by adding price data to a pooled sample of households permit the authors to do what earlier studies could not do: derive true cost-of-living indices from cross-section data. Coauthors are David Betson, Myung-Hoon Lee, and Jacques van der Gaag. *J. Post Keynesian Econ.*, Spring 1987, 9(3), pp. 364-80. University of Wisconsin.

Starck, Christian C.—Indexation and Household Saving Behavior: Some Empirical Evidence from Finnish Data

This paper utilizes data from Finland concerning indexed deposit accounts to produce empirical evidence on the effects of indexation on the saving behavior of households. Findings support the view that the hedging ability of a fully indexed asset in the presence of inflation uncertainty causes reallocation through a hedging demand towards a larger share of the indexed asset. This conclusion seems fairly robust with respect to various proxies for household wealth, modification of the basic model, and estimation methods. Saving through banks are positively affected but not the savings ratio in

general. *Weltwirtschaft. Arch.*, 1986, 122(4), pp. 713-27. Bank of Finland.

### 930 URBAN ECONOMICS

#### 931 Urban Economics and Public Policy

Erickson, Rodney A. and Wollover, David R.—Local Tax Burdens and the Supply of Business Sites in Suburban Municipalities

The purpose of this study is to examine the effects of local household tax burdens and other community attributes on the supply of business sites made available by local municipalities. A model of community site supply is tested in which municipalities trade-off increased fiscal benefits from business location and reductions in environmental quality that accompany industrial and commercial development. This trade-off is embodied in municipal zoning decisions. Empirical analysis of industrial and commercial zoning in two rapidly growing suburban counties of the Philadelphia metropolitan area provides considerable support for the tenets of community site supply theory. *J. Reg. Sci.*, Feb. 1987, 27(1), pp. 25-37. Pennsylvania State University; Naval Air Systems Command, Washington, D.C.

#### 932 Housing Economics

Allen, Paul R.; Shilling, James D. and Sirmans, C. F.—Contracting Contingencies and Single-Family House Prices

This paper investigates the relationship between single-family house prices and contingent terms in contracts. Since contingencies create uncertainty, the market should exact a price premium. The results indicate that the contracting for property rights affects house prices in the predicted ways. *Econ. Inquiry*, Jan. 1987, 25(1), pp. 159-64. Louisiana State University.

Jud, G. Donald and Bennett, D. Gordon—Public Schools and the Pattern of Intraurban Residential Mobility

This paper examines the influence of school quality and student racial composition in shaping the pattern of intraurban migration. The first section develops a model of intraurban migration. The second section tests the model using data from a survey of recent homebuyers in Charlotte, North Carolina. Next, the model

is reestimated using data on school enrollment changes in Los Angeles County, California. The final section summarizes relevant findings. In both Charlotte and Los Angeles, the academic quality of public schools is found to be a significant factor in shaping the pattern of intraurban mobility, and this effect appears to be independent of school racial composition. *Land Econ.*, Nov. 1986, 62(4), pp. 362-70. University of North Carolina, Greensboro.

Rätzer, Ernst—Mieterschutz und Wohnungsmarkt. Die Mietpreisbeschränkung im schweizerischen Missbrauchsbeschluss (Tenant Protection and the Rental Housing Market. The Regulation of the Prices of Rental Housing in the Swiss Legislation against Abuses)

Based on a theoretical analysis, all legislation which is effectively influencing the prices of rental housing has, in the longer run, effects upon several variables: maintenance level, frequency of change of tenants, vacancy rate, housing shortage, duration of life of apartment houses, frequency of demolitions, housing density, mobility of tenants, and volume and prices of newly constructed houses, among others. Whether the Swiss legislation against abuses really has these effects is not evident *a priori*, but has to be confirmed by empirical evidence. A first examination of available data does not seem to contradict the hypothesis of a certain effectiveness. *Schweiz. Z. Volkswirtschaft. Statist.*, Mar. 1987, 123(1), pp. 23-45 (German). Brückreutweg 64, 3110 Münsingen, Switzerland.

Schwartz, Seymour I.; Zorn, Peter M. and Hansen, David E.—Research Design Issues and Pitfalls in Growth Control Studies

Accurate measurement of the effect of growth control on house prices requires that the research design control for factors other than the growth control program that could affect house prices. This paper draws on a hedonic view of housing markets to examine and compare the merits of several forms of quasiexperimental and statistical controls. The methodological critique is tested empirically, using data from Davis, California (a growth control city) and three comparison cities. The resulting estimates

of the growth control effect vary widely among the methods, and in particular, between a theoretically inferior method that is widely used and the preferred method. It is concluded that preferred methods are able to reduce important sources of bias. *Land Econ.*, Aug. 1986, 62(3), pp. 223-33. University of California, Davis; Cornell University; University of California, Davis.

Thalmann, Philippe—Explication empirique des loyers lausannois (A Hedonic Approach to Explaining Rents in the Community of Lausanne)

The hedonic method is described and used for explaining rents in the community of Lausanne as a function of a small number of indicators. By calibrating a second index for the other communities of the district, it is possible to test the robustness of the method and to distribute the differences in the rents. The data for the hedonic model were obtained from a micro-survey in the Canton of Vaud in 1983. In particular, the approach makes it possible to compare the rents to calculate the "usual rents" for "comparable dwellings" of the rent surveillance in Switzerland, and also to estimate the rent value for freehold flats. *Schweiz. Z. Volkswirtschaft. Statist.*, Mar. 1987, 123(1), pp. 47-70 (French). Harvard University.

### 933 Urban Transportation Economics

Foster, Christopher D. and Golay, Jeanne—Some Curious Old Practices and Their Relevance to Equilibrium in Bus Competition

Local bus monopolies were created in the 1930s, *inter alia* to overcome dangerous competitive practices. The 1986 Transport Act restored local competition. This paper uses and extends elements of models developed to examine spatial equilibrium, to examine whether equilibrium exists and, if not, whether former dangerous practices will be revived. The answer is that in plausible circumstances, equilibrium exists and the worrying practices would not be rational on routes without appreciable congestion and where demand is reasonably predictable. Otherwise they may occur, but should not be disequilibrating. *J. Transport Econ. Policy*, May 1986, 20(2), pp. 191-216. British Telecom, London.

**nister, Stephen—Bus Deregulation, Competition and Vehicle Size**

Simulation of open competition on the network of bus routes in a medium size British town. Pricing, product differentiation, and level of service are discussed. Service frequencies and patronage will be substantially increased on the densest route. Some routes previously dependent on receipt of cross-subsidy might be capable of independent expansion and the weakest routes will contract somewhat. Small vehicles will often have a competitive advantage over the traditional size. On dense routes they may operate in competition with larger vehicles offering a better service at a premium price. There might be significant adverse effects on traffic congestion. *J. Transp. Econ. Policy*, May 1986, 2(2), pp. 217-44. London School of Economics and Political Science.

**Wiley, Wayne K. and Anderson, Eric E.—An Urban Transit Firm Providing Transit, Paratransit and Contracted-out Services: A Cost Analysis**

This paper analyzes the cost structure of a nontraditional (but increasingly important) public transit firm, i.e., a paratransit-transit firm which provides both mass transit and paratransit services as well as contracted-out service. A number of conclusions follow from the analysis. First, contracting out a service substitutable for motorbus service may induce unionized motorbus operators fearful of job losses to agree to work-rule changes that allow transit management to change their work schedules in order to lower the cost of motorbus service. Second, if a service provision measured in terms of vehicle miles, the services ranked according to cost are having the largest cost elasticity to the lowest are motorbus, elderly and handicapped paratransit, van pool paratransit, and contracted-out dial-a-ride paratransit service, respectively. *J. Transp. Econ. Policy*, Sept. 1986, 3(3), pp. 353-68. Old Dominion University.

**Robster, F. V. —Transport in Towns: Some of the Options**

In urban areas, current trends in population growth, employment location, car ownership, travel habits, and costs for public and private means of transport all favor more private car use at

the expense of public transport. Those without easy access to a car, including many members of car-owning households, may experience increasing hardship if these trends continue. The potential of policy options to modify these trends is considered, examining in particular the impacts of public transport subsidy, improved public transport operating efficiency through deregulation, new road and rail investment, and private traffic restraint. *J. Transp. Econ. Policy*, May 1986, 20(2), pp. 129-52. Transport Road Research Laboratory, United Kingdom.

**940 REGIONAL ECONOMICS**

**941 Regional Economics**

**Carlino, Gerald A. and Mills, Edwin S.—The Determinants of County Growth**

This paper explores the determinants of population and employment densities interregionally. The theoretical model, attributable to Donald N. Steinnes and Walter D. Fisher, permits simultaneous determination of population and employment densities. This is applied to data for about 3,000 counties in the United States to analyze the effects of economic, demographic, climatic, and policy-related variables on the growth of population and employment during the 1970s. Considering employment, differential county growth is explained in terms of economic and demographic conditions; regional and policy variables matter less. For population, climate matters as a preference for sunbelt states. Local government programs regarding education and tax policy seem to play a role. *J. Reg. Sci.*, Feb. 1987, 27(1), pp. 39-54. Federal Reserve Bank of Philadelphia; Princeton University.

**Dow, Sheila C.—The Treatment of Money in Regional Economics**

A survey of regional monetary theory suggests a regional segmentation of financial markets on the basis of differences in portfolio preference or market imperfections. These possibilities are explored using post-Keynesian monetary theory. It is concluded that the availability of credit to a region depends more on the (potentially volatile) degree of confidence in the regional economy. The amount of liquidity thus generated depends on the propensity

for capital flight due to liquidity preference. The resulting tendency for regions attracting low degrees of confidence to experience liquidity shortage will be greater the more integrated the national banking system. *J. Reg. Sci.*, Feb. 1987, 27(1), pp. 13–24. University of Stirling, Scotland.

**Nagurney, Anna**—Computational Comparisons of Spatial Price Equilibrium Methods

In this paper the author proposes new algorithms for the solution of both general and standard spatial price equilibrium problems, and tests their performance with existing algorithms on randomly generated problems. For the standard problem, she proposes decomposition schemes based on the concept of "equilibration operator" and compares their performance with the Frank-Wolfe method. For the general problem, the author's presents alternative variational inequality formulations defined over Cartesian products of sets and then exploits these formulations to construct Gauss-Seidel type serial decomposition methods. She then compares their performance with the projection method. The computational tests suggest that the new schemes are substantially more efficient than earlier ones. *J. Reg. Sci.*, Feb. 1987, 27(1), pp. 55–76. University of Massachusetts.

**Roback, Jennifer**—Determinants of the Local Unemployment Rate

This paper uses a hedonic price model to decompose the local unemployment rate into its supply and demand components. The theoretical section predicts that wage premia demanded by workers for unemployment would rise with increases in the local unemployment rate. The prediction for the firm side is ambiguous but the presumption is that premia fall as unemployment rises. The model was tested us-

ing Colombian Census Data (1973). The empirical results conform to theoretical expectations. The results also are consistent with the Todaro (1969) hypothesis about migration. *Southern Econ. J.*, Jan. 1987, 53(3), pp. 735–50. George Mason University.

**Sakashita, Noboru**—Optimum Location of Public Facilities under the Influence of the Land Market

This paper discusses the problem of the optimal location of public facility(ies) in a long narrow city, especially taking into consideration the externality-internalizing effect of the land market. It shows a systematic approach to dealing with the land market mechanism in first a one-facility and then a two-facility case. The analysis assures the importance of posing the location-optimizing problem even under the influence of the land market. *J. Reg. Sci.*, Feb. 1987, 27(1), pp. 1–12. University of Tsukuba, Japan.

**Tobin, Roger L.**—Sensitivity Analysis for General Spatial Price Equilibria

General spatial price equilibrium models are formulated as variational inequalities. Sensitivity analysis results recently developed for variational inequalities are reviewed, which give conditions for existence and equations for calculating the derivatives of solution variables with respect to perturbation parameters. These results are applied to the variational inequality formulations of general spatial price equilibria, and derivatives of supplies, demands, flows, and prices with respect to perturbations of supply functions, demand functions, and transportation-cost functions are calculated. *J. Reg. Sci.*, Feb. 1987, 27(1), pp. 77–102. GTE Laboratories, Waltham, Massachusetts.

# Index of Authors of Articles in the Subject Index

This *Index* includes all articles included in the *Subject Index*; the numerical references (arranged randomly) are to the *subject classification(s)* of the article. Classifications for different articles by the same author are separated by a semicolon; *page number(s)* for abstracts appear in *italics* in parentheses for articles with abstracts. If an article is written by two or three authors, each author is listed separately; if by four or more authors, it is listed under the first author only, followed by *et al.*

The list, produced by computer, is alphabetized letter by letter; the entry is then truncated to the last name and initials. This method leads to such anomalies as: (1) an author may be listed twice if only initials appear in one article and full name(s) in another; (2) alphabetization may appear to be incorrect on the second initial.

## Computer Access to Articles in the JEL Subject Index

Online computer access to the *JEL* and *Index of Economic Articles* database of journal articles is currently available through DIALOG Information Retrieval Service. DIALOG file 139 (*Economic Literature Index*) contains complete bibliographic citations to articles from the nearly 300 journals listed in the quarterly *JEL* issues from 1969 through the current issue. The abstracts published in *JEL* since June 1984 are also available as part of the full bibliographic record. The *Economic Literature Index* also includes citations to articles in the 1979 and 1980 collective volumes (collected papers, proceedings, etc.) for the *Index* database; other years will be added as soon as completed. The file may be searched using free-text searching techniques or author, journal, title, geographic area, date, and other descriptors, including descriptor codes based on the *Index's* four-digit subject classification numbers. (For a complete description of the *Economic Literature Index* with search examples and suggestions for searching techniques, see the article "Online Information Retrieval for Economists—The Economic Literature Index," in the December 1985 issue of the *Journal of Economic Literature*.)

### *Access Options:*

- **DIALOG** offers a variety of contract choices, including the option (for a low annual fee) to pay for only what you use. Most university libraries already subscribe to DIALOG. For information on the DIALOG service, contact your librarian or write to or call: DIALOG Information Services, Inc., Marketing Department, 3460 Hillview Avenue, Palo Alto, California 94304 (800-3-DIALOG or 800-334-2564).
- **Knowledge Index**, a DIALOG service available after 6 p.m. and on weekends, may be accessed at the low rate of \$24/hour, charged to a major credit card. A one time start-up fee of \$35.00 buys 2 hours free time during the first month after log-on. Call 800-3-DIALOG for information.
- **EasyNet**, a gateway service, provides menus to guide the untrained user through database searches in DIALOG and other databases. For information, call 1-800-841-9553 or dial up EasyNet on your terminal (1-800-EASYNET) and pay for your search by credit card.

### *Classroom Instruction:*

- **DIALOG's Classroom Instruction Program**, available at a special rate of \$15/connect hour to academic institutions for supervised instruction, permits teachers to incorporate online bibliographic searching in their courses. For information, contact DIALOG or your librarian.

# Soviet Economic Growth: 1928–1985\*

By GUR OFER

*The Hebrew University of Jerusalem*

*To the memory of Simon Kuznets, my teacher and dear friend.*

## 1. Introduction

SINCE THE BOLSHEVIK REVOLUTION OF 1917, the Soviet Union has transformed itself through an intense drive for economic modernization, from an undeveloped economy into a modern industrial state with a GNP second only to that of the United States. During that period the Soviet economy grew by a factor of ten and the level of GNP per capita grew more than fivefold. Its industrial structure has changed diametrically, from an economy with 82 percent rural population and most GNP originating in

agriculture to one that is 78 percent urban with 40–45 percent of GNP originating in manufacturing and related industries. Furthermore, Soviet military capability is considered to be on a par with that of the United States.

At first glance, the Soviet case seems to be a classical example of economic modernization. In spite of this, many international comparisons of modern economic growth exclude the Soviet Union and the other communist countries. Hollis Chenery and Moises Syrquin (1975, pp. 11–16) exclude them owing to “problems of comparability,” without specifying

\* This survey of modern Soviet economic growth is based almost exclusively on Western works and does not include direct references to Soviet scholarly work. It is directed to the general public of economists, and therefore contains a section (II) on sources of economic information about the Soviet Union and a number of subsections, like the one describing the basics of the operation of the Soviet system, that are only indirectly related to the main issue. I hope they will provide useful background for the general reader. The amount of relevant literature on the topic is immense, but there seems to be a considerable degree of agreement on the main issues. Two results follow: first, not all the works that probably should have been cited are included, and I beg the indulgence of the authors of such works. Second, in many places I choose to present issues and views as representing the general consensus of the field, or, at the other extreme, my own views. I try to make clear which is which. In case of doubt, I take personal responsibility for unattributed statements. One example of a partial contribution of my own is the article's extended attention to the theme of “haste” as

a major force driving many elements of the Soviet growth strategy and system.

A major part of the survey was prepared during a stay at the RAND Corporation in the summer of 1985, under the auspices and with the financial support of the RAND/UCLA Center for the Study of Soviet International Behavior. I wish to thank Arnold Horelick, Gregory Hildebrandt, and Keith Crane of the RAND Corporation for many helpful comments and discussions. I also appreciate the many comments received during seminars at RAND and at the Russian Research Center at Harvard. I am most grateful to Abraham Becker, Abram Bergson, and Moses Abramovitz, who followed the survey since its inception and through a number of drafts. The fruits of their many comments, corrections, and suggestions are evident throughout the paper and in many omitted sections. Simon Kuznets, before his death, took a very active part in shaping the scope and structure of the paper. Adèle Zarnati, Judith Goldberg, Nancy Weber, and Maggie Eisenstadt put much effort into editing and typing, and Adi Brender helped with the tables. Thanks to all.

ing what is noncomparable. Simon Kuznets (1963), who did compare the Soviet record to the Western one, nevertheless hesitated to include it in his general studies "because the social structure and the institutional means by which economic growth is secured in communist countries are so different" (Kuznets 1971a, p. 10; see also Kuznets 1966, pp. 400, 508; 1963, pp. 367-72).

The aim of this paper is to present and evaluate Soviet economic growth as it appears in the specialized "Western" literature, in a framework of "modern economic growth" as developed by Kuznets (1966, 1971a), Alexander Gerschenkron (1962, 1968), and many others. Does the Soviet experience belong to this general paradigm? Whether it does or not, how does its experience compare with that of the major (or minor) Western countries? What are the implications of the differences found for past records and for future prospects? Modern economic growth is perceived as a general framework, a wide concept, within which many variants and diverse itineraries are accepted and tolerated provided that certain essential features are present. A case in point is the distinction between leaders and followers, where latecomers face different internal and external environments calling for special growth strategies. The Soviet Union is a classical follower, whose experience among others served Gerschenkron and others in shaping a theory of the pattern of economic modernization. In fact, Gerschenkron (1962, 1968) made "following" in the context of the European experience a sort of monotonic variable where the particular pattern of economic development is determined, among other things by the relative degree of lateness in a given country's development.

In addition to the country's rank in the development queue, growth patterns can be affected by differences in histori-

cal background, in national culture and, of particular interest here, by different economic and political systems and international aspirations. It was the Soviet Union's authoritarian regime and its particular "socialist" economic system that caused Kuznets to exclude it from his comparative studies. The Soviet mode of development was introduced in the late 1920s, when it was heralded as superior, as promising to become the wave of the future, and as a model for other undeveloped countries. At the same time counterclaims were being voiced: that modernization cannot be achieved without basic freedoms and that central planning is inherently inefficient and bound to fail.<sup>1</sup> So far, history has proved both extreme claims wrong, but the debate on whether the Soviet system is capable of sustained economic development still rages on. We shall therefore pay particular attention to the effects of the economic system and the political regime on patterns of economic modernization.

Until the late 1950s, the era of rapid Soviet growth and of Sputnik, the main question among Western scholars was: *When* would the Soviet Union catch up with and overtake the U.S.? Even sober and careful scholars like Abram Bergson (1961, pp. 297-98) did not exclude the possibility that this might be fairly imminent. Today, however, after more than two decades of declining growth rates (down to 1.5 percent GNP growth recently), the question is whether the present system can support sustained economic growth in the future, or whether it is capable of changing radically enough to assure such growth. This question is posed not only by specialists on either side of the iron curtain, but by Mikhail Gorbachev himself, who is embarking on

<sup>1</sup>This and related issues are at the heart of the "Socialist controversy." See Friedrich A. Hayek 1963; Ludwig von Mises 1974; and Oskar Lange 1938.

a program designed to prove that it can. It is still not clear whether Gorbachev will be able to start a truly new era of Soviet general and economic history. It is, however, an appropriate time to summarize the past record and to evaluate the problems to be faced in the future.

Because this is not the place to survey the large volume of Western literature on economic modernization and modern economic growth, Kuznets' synthesis and summary framework will serve as its representative.<sup>2</sup> Modern economic growth (MEG) as defined by Kuznets (1966, p. 1) "is a sustained increase in per capita or per worker product, most often accompanied by an increase in population and usually by 'sweeping structural changes' of a multidimensional nature;" it is driven by the "epochal innovation" which consists of "the application of science to the problems of economic production" and to "the material satisfaction of wants" (Kuznets 1966, pp. 9, 11). Scientific advance and its application to production are the driving force of MEG; they assure sustained growth and growth in per capita income and make for permanent structural change. They also generate further scientific advances (Kuznets 1966, 1971a). The qualitative dimensions assigned by Kuznets to the growth parameters and the particular kinds of structural changes in the economic, social, and political spheres occurring as MEG sets in will be discussed later. Here we emphasize only the everchanging nature of the structure of the economy and society under MEG caused by the constant shift in leading sectors and in the focus of economic activity and by the character of technological changes.

For Kuznets (1966, Chs. 8, 9), S. Noah

Eisenstadt (1973, 1985), Walt W. Rostow (1960, 1963) and others, MEG, as a major historical departure, originated in Western Europe and spread to other regions by virtue of its clear dominance in both economic and military spheres. But conditions in the latecomers differ in many respects from those in the more advanced countries at the time each entered the process of modern economic growth; and the mere existence of advanced countries also changes the environment of MEG for followers, so that it is likely to take a somewhat different course from that followed by the early starters. That is why Gerschenkron (1962, Chs. 1, 2, and pp. 253-366; 1968, Ch. 9) developed his theory according to which the nature of MEG in Europe varies with the level of economic backwardness at the time MEG sets in. The starting conditions of a latecomer create two sources of tension: One is the desire to narrow its income gap relative to the most advanced countries; the second is the greater difficulty in takeoff because of poorer preconditions for growth than those of leading countries at their starting point. The more backward the country at its starting point, the higher the tensions. Tension breeds impatience, which leads to more drastic, radical, even revolutionary, discontinuous steps in all spheres—economic, political, and social. Impatience and different preconditions also lead to the choice of different growth paths. A major example is the choice to start with industrialization and to postpone changes in agriculture. An advantage that offsets some of these difficulties for a latecomer is the opportunity to borrow technologies from the advanced countries without going through the costly and time-consuming process of developing them from scratch. This advantage, first noticed by Veblen, though real, is not costless and its fruitful exploitation also depends on frequently-missing preconditions (Mad-

<sup>2</sup> For a short survey of the main contributions see Angus Maddison 1962, Ch. 1. See also Walter W. Rostow 1960 and the many volumes of argument on his theory.

dison 1982, pp. 107–08). Finally, like any case of transfer and diffusion of a major innovation, success depends on the mutual relationship between the partners and on the form of transfer.

As noted, the Russian and the Soviet cases are important historical examples on which Gerschenkron based his theory. The government-led industrialization drive during the last decades before the Bolshevik revolution is a case in point. The revolution; the authoritarian-dictatorial regime; the central direction, management, and control of the economy; the strategy of “industry before agriculture”—all these and other aspects are extreme manifestations and outcomes of aggravated tensions. In a sense, the acceptance and application of Marxist ideology as a major vehicle of the Western concept of rapid industrialization and its reshaping into Soviet socialism to fit the needs of a relatively backward country with high aspirations also fall into the framework drawn by Gerschenkron (1962, Chs. 6, 7; 1968, Ch. 7; and 1971). With international fears and aspirations, the urge to prove the superiority of socialism and, possibly, also the character of the leaders, the Soviet case is clearly an extreme one even in Gerschenkron's framework.

Most of the major decisions on the development strategy of the Soviet Union and on the nature of the regime were made in the 1920s and in the early 1930s. But, as we shall see, their impact can be observed in Soviet patterns of behavior to this day.

A short discussion of the sources of economic information on the Soviet Union and their reliability (Section II) is followed by a survey of its growth record (Section III) and of the major structural changes in the Soviet economy (Section IV), both in a comparative setting. Sections V and VI discuss the elements of the Soviet system, its growth strategy,

and the major economic policies that determine its growth patterns. The following section (VII) focuses on the explanation offered in the literature for the declining growth rates of the Soviet Union. The discussion makes use of both production function estimates and growth accounting. The concluding section discusses the Soviet system's prospects of reversing the declining trend and assuring sustained growth, in the light of changes and reforms that may be needed. It takes some notice of the reforms that are being introduced by Gorbachev.

## II. *Availability and Reliability of Information*

More economic information emanates from official Soviet sources than is generally believed. While the amount is a far cry from what is usually available for free countries, it is often more than is available for many less developed countries. In most instances, information is unavailable because it is withheld from the public, internal or external, and not because it was not compiled. In a centrally planned system, very detailed economic information on the operation of economic units or sectors is essential for planning and for control. It must be transmitted through all stages of the hierarchical ladder and in many cases also via public media channels.

Nevertheless, Western students do face a serious problem in obtaining Soviet economic information. Furthermore, in most cases, even when the needed data are available, they need a great deal of checking, reestimating, and manipulating before they achieve the minimal standards of reliability and usability. Following a brief survey of what is and is not available, this section discusses the main reasons for the low usability and questionable reliability of much of the data

and the steps being taken in the West to overcome these problems.

With few exceptions, the information available to the West on the Soviet economy comes from Soviet official publications and sources. The major publication is the annual *Statistical Yearbook*, issued for the Soviet Union as a whole and for each republic and some lower regional units separately. Occasional special yearbooks or statistical compendia are devoted to a particular area: agriculture, education, labor, and the like. One of these is on Soviet international trade (*Vneshnaya Torgov'ia*), which presents very detailed trade statistics by type of good and country, and is issued every year. Another important source of information is the publications of the returns of the population censuses taken in the Soviet Union approximately every decade (1939, 1959, 1971, 1979). Many journals publish economic information, either in a special appendix, like the *Vestnik Statistiki*, the official journal of the Central Statistical Administration (CSA), or as an integral part of ordinary articles. Finally, economic information is available from newspapers, from other mass media, and from books and other publications.

In some spheres the West gathers information on the Soviet Union in less conventional ways, ranging from interviewing émigrés, such as was done by the Harvard Project in the 1950s, the Israeli Soviet Interview Project (ISIP), the American Project (SIP), to collecting information (such as on prices) during visits to the Soviet Union, estimating the grain crop or other visible objects using pictures taken from satellites, and other clandestine methods.

The availability of economic information on the Soviet Union has varied quite drastically over time according to the degree of general openness of the system. Information was readily available during

the 1920s but severely restricted during most of Stalin's era. During the dark era of the late 1930s and up to the mid-1950s, even basic economic information, like the *Statistical Yearbook*, was unavailable and it took great efforts to screen large volumes of publications and "read between the lines." The flow of information was renewed in the mid-1950s and reached its peak during the mid-1960s, followed by more and more restrictions, mostly in specific areas, imposed by the Brezhnev administration. Beginning under Andropov and picking up steam since Gorbachev, the pendulum has swung again toward more openness. Gorbachev's call for more publicity, openness, and accessibility of information (*glasnost*) and more open criticism and debate relates first and foremost to the economic sphere and is bound to raise the level of available information (Timothy Colton 1986, pp. 160–64).<sup>3</sup>

This discussion on the availability and reliability of Soviet data relates mostly to the post-Stalin era. With regard to availability, first of all, data on the Soviet defense effort, very broadly defined, are unavailable. Other sensitive spheres are also classified secrets. A recent example of the latter is the suppression, since the late 1970s, of previously provided information on trade in crude oil with individual countries. Second, "embarrassing" information is suppressed. The system, which declares one of its main goals to be a high level of income equality, publishes scant and not very revealing data on this topic. It is known that such data are regularly compiled by the CSA. Another example is the suppression for a number of years of detailed data on infant mortality (and other demographic changes), when these rates started to rise

<sup>3</sup> Jan Vanous (1987), however, demonstrates a deterioration in the quality and consistency of national accounts figures produced by the Soviet Central Statistical Administration during 1985 and 1986.

in the early 1970s (Christopher Davis and Murray Feshbach 1980; Feshbach 1985). In general, much data on negative social or economic phenomena are suppressed, including most data on activity in the "second economy."

A third type of data that are very difficult to obtain from Soviet sources are microdata on the behavior of individual economic units, households, or firms. Here, the various interview projects mentioned above are of value. Most of the official economic data are highly aggregated, and most published analyses are restricted to tables classified by one or two explanatory variables. It is also not easy to acquire detailed data on individual prices, and very difficult to receive systematic data on price compilations and other economic calculations.

Finally, whether as part of the secrecy screen, or for other reasons, much information published by the Soviet authorities is partial and presented in obscure, cryptic, or incomplete fashion. Percentage breakdowns with no information on absolute levels and with wide leftovers of undefined residuals are very common. The breakdown in many incomplete series does not add up to the total. The balance-of-payments data are restricted to trade in goods, with no information on trade in services and on the capital account, so that no balance-of-payments accounts can readily be estimated (Vladimir G. Trembl and Barry L. Kostinsky 1982).

This last point takes us from the question of availability to that of the quality, usability, and reliability of published information. Outright use of Soviet official data is in many cases impossible because of a number of problems: first, uncertainty regarding the quality and reliability of the information received and collected by the central Soviet authorities from the field. Next comes the major question of the conceptual and methodo-

logical frameworks and the particular sets of definitions used in order to organize, aggregate, and compile economic data series. Finally there is the critical question of truth in reporting: To what extent is false reporting used in the service of internal or external political and public-relations goals? The secrecy cover over the work of most agencies producing economic information causes difficulties in giving definite answers to these questions or to the understanding of the exact source of the problem with the data. All this imposes on interested parties in the West a heavy burden of interpreting, checking, and recalculating much of the presented data before it can be meaningfully used.

The literature mentions two specific sources of possible biases in data reported to or collected by the central Soviet statistical agencies. The first stems from the fact that in many cases the units that report and transmit economic information to higher echelons are judged and remunerated on the basis of their reports. The problem is also present to some degree in many other countries, for example, the reporting of personal income for tax-collecting purposes. In the Soviet Union this problem pervades almost the entire economy. The second bias is created by peculiarities, probably motivated by propaganda or ideological considerations, in the design of samples for official statistical surveys and inquiries: The structure of the family-budget survey is biased in favor of families with two or more working members; the sample of collective farm markets is biased in favor of certain locations.<sup>4</sup>

<sup>4</sup> See Vladimir G. Trembl and John P. Hardt 1972; Alastair McAuley 1979, Ch. 3; Stephen Shenfield 1982; Trembl 1985. A very interesting and revealing article on false reporting and many other serious shortcomings of Soviet statistics appeared in the Soviet journal *Novy Mir* in February 1986 (Vasily Selunin and Gregory Khanin 1987).

With regard to the question of true reporting, most Western scholars seem to agree that the Soviet Union does not keep two sets of books or two sets of economic accounts, one to use and another to publish for propaganda purposes. Such an endeavor is first of all very expensive and burdensome, and secondly, two sets of economic information would cause serious confusion. Published data are used so extensively by decision makers and control offices at all levels, that double bookkeeping, as a general practice, is inconceivable. It follows from the argument that the reliability of data may be assumed to be higher the closer it is to the decision-making and control apparatus, and vice versa. It may be assumed that less aggregated series, especially those defined in physical terms, are more directly related to the operation of the system, while the more aggregated series, denominated in monetary terms, are less so connected. This could be one reason why the latter, such as data on national accounts, general price indices, are considered much less reliable by Western students and are, indeed, subject to extensive reestimation.

Propaganda is most often served by publishing the better economic results and restricting the publication of failures; by manipulating information to provide half-truths rather than outright lies; and by carefully choosing definitions, methodology, concepts, and variables in terms of which information is published. All this makes some of the Soviet data, while still "reliable" in a formal sense, hard to interpret and use in Western research; in some cases the data are deliberately misleading, and in some cases the system may, so to speak, cheat itself. The most notorious example comes from Stalin's era, when harvest reports were given in terms of grain in the field, before harvesting and threshing losses. The definition has since improved (reports are

made post-harvest), but still does not fully accord with Western usage. The reported figures are still inflated, and Western students must engage in guess-timates to translate them into terms of grain in silos, the acceptable definition in the West. Another extreme example where a definitional problem becomes an open evasion is the entry for Soviet defense expenses in the federal budget. According to Western estimates this entry (with or without a Soviet conceptual meaning) is but a small part of total defense spending, which does not even reflect trends over time. Some scholars are searching for a definition of defense spending that may be consistent with the budget entry as given (Peter J. D. Wiles 1985).

In many cases, definitions of terms differ from common Western practice not only for propaganda reasons but also for ideological or practical purposes. A major example is the entire system of national accounts which, following Marxist doctrine, excludes most services from national product on the grounds that they are "nonproductive," and excludes interest on capital from national income because it is a nonlegitimate factor payment. A probable example of expediency is the wide use of gross production series, including intermediate uses, as major indices of production results. Even without questioning the motivations for the difference in each case, much effort is required to make Soviet data comparable and consistent with corresponding Western concepts and data. In many cases such efforts are severely hampered by the fact that the definitions and conceptual frameworks are withheld or obscured. At times changes in definitions or scope are also made without much warning or publicity.

A third major difficulty in the interpretation of Soviet data is the different meaning of prices in the Soviet system. First,

almost all prices are determined by the central authorities, not by market forces, according to some kind of average cost *plus* a profit norm where costs exclude rents and at least some interest charges. Consequently, prices are not as a rule scarcity prices. When goods must clear markets, as in the consumer sector, taxes are added to factory or wholesale prices. Convenience of accounting and control and difficulties in making frequent calculations in order to change prices result in an administratively determined price stability, taken individually or as price indices.

Most price changes occur in periods of "price reforms," which happen every ten or fifteen years. This is not the place to discuss the allocative problems and distortions caused by nonscarcity prices, but we should note that because most economic data involve the use of prices it is quite difficult to evaluate economic magnitudes and to compare them with corresponding magnitudes in countries where prices are nearer to market prices.

Enormous efforts have been made over the years to estimate "adjusted factor costs" in the Soviet Union that would correspond to conventional Western definitions (Bergson 1961, Chs. 8, 11), but these cannot hope to correct all distortions fully. Stability of prices over time may be an advantage when time series are estimated and evaluated, and in this respect Soviet prices are an asset. The caveats are that official prices do not usually reflect actual costs, and in a country where prices fixed at the top are combined with excess demand for goods, hidden inflation is bound to set in. The problem of hidden inflation becomes even more serious because of the peculiar Soviet practice of calculating many price indexes, apparently by combining new products into the indices at too high (later year) initial prices. In this way, quantity indices are biased upward while price

indices are biased downward. As we shall see, this problem is most serious in the machinery production sector, where the physical series for individual machines show much more moderate rates of growth than does the aggregated quantity index (Gerschenkron 1962, p. 263). Because the outcome serves mainly propaganda purposes, it is hard to dismiss the assumption that this peculiar methodology was deliberately chosen primarily to serve such purposes. All these factors make it very difficult to estimate correct price indices or to evaluate the contribution of hidden inflation to Soviet economic achievements.

In view of the above, and because it is most important for the U.S. and the West to have reliable economic information on the Soviet Union, it is not surprising that Western countries and scholars, and especially the U.S., have been investing substantial resources to collect and interpret this information for the use of policy makers and scholars. First priority is given to the estimation of the Soviet defense budget; the system of Soviet national accounts and general economic performance come second. The CIA, the Census Bureau, the Department of Agriculture and many other U.S. government agencies, the RAND Corporation and many nonprofit research outfits, and Russian research centers in many big universities have joined with a number of profit organizations to reveal the Soviet economic picture. In addition to regular statistical series, a number of macroeconomic models or frameworks for the Soviet economy are used as analytical tools to study and understand past changes and to predict future developments.

The methods used to check the reliability of Soviet economic data or to reestimate them vary, of course, in accordance with the quality of the initial data and the nature of the problem. Most such

Processes entail some common steps: Soviet data are checked for consistency with relevant available Soviet sources. As far as possible aggregate magnitudes are reconstructed on the basis of Soviet quantity series of individual items, individual Soviet prices or values, and in conformity with definitions and methodologies common in the West. This combination of disaggregated Soviet physical series and individual prices within a Western conceptual framework produces a body of data that is both reasonably reliable and compatible with corresponding data on Western countries.

More details on the outcome of these Western efforts are given in the following sections, where specific data categories are presented and discussed. As we shall see, despite the great efforts invested in collecting, understanding, recalculating, and checking the Soviet sources, many ambiguities, doubts, blank spots, and disagreements remain. Nevertheless, the reader who wonders at this point whether he or she should proceed any further can, I think, be reassured by a general agreement among researchers in this field that we do have a basically sound body of economic data about the Soviet Union which is also comparable with similar records of market economies.<sup>5</sup>

<sup>5</sup> Older studies on the reliability of Soviet economic formation are Bergson 1947, 1953a; Gerschenkron 1953; Alec Nove 1964. A relatively recent contribution to this field was made by Trembl and Hardt 1972. Information based on Soviet input-output data is presented and analyzed in Trembl and Hardt 1972; Trembl 1977; A. Tretyakova and Igor Birman 1976. A recent summary of Soviet national income definitions and comparison with Western GNP definitions is CIA 1978). Systematic series on Soviet national accounts and the economic magnitudes are presented in CIA 1983) and JEC (1982a) and in the CIA's annual *Handbook of Economic Statistics*. A description of Western macro models of the Soviet economy appears in Hilbrandt (1985a). The most comprehensive effort is a reconstruction of the Sovmod model (Donald Green and Christopher I. Higgins 1977), now with a number of offspring. Other relevant sources will be cited below.

### III. The Growth Record

In this and the following section the Soviet growth record and structural changes are presented and compared with the experience in the non-Socialist world and with general quantitative frameworks of "modern economic growth" of market economies, such as the one formulated by Kuznets. Before embarking on the analysis itself, however, we must establish the basis for such comparisons. A common pattern of such studies is to compare the growth record of the country under investigation with that of other countries "at a similar stage of development." The initial working hypothesis is that if, other things being equal, the growth record investigated conforms to the general, typical, or "normal" pattern, and because each individual country deviates from the average pattern, these deviations, if significant, form the basis for investigation into their causes (Kuznets 1971a; Chenery and Syrquin 1975; Ofer 1973).

The main dependent variable in most comparative studies, and their main normalizing criterion, is GNP per capita, which is accepted as the best, though far from ideal, single variable capturing many developmental features. The first step is thus to establish the level of Soviet GNP per capita in a comparative setting. A recent extensive CIA effort to compare the Soviet and U.S. economies between 1956 and 1977 estimates Soviet GNP in 1975 at 62 percent of the U.S. level (Imogene Edwards et al. 1979, pp. 381-83). Data on later years are obtained by adjusting this figure according to Soviet and U.S. growth rates of GNP and GNP per capita to the desired date. These calculations produce a USSR/US GNP per capita ratio of 50.3 percent for 1980. The

low. A reconstruction and reestimation of Soviet national accounts according to Soviet definitions was compiled by PlanEcon (PlanEcon Report 1986).

comparison is based on the purchasing power parity (PPP) method, and the figures given are the geometric mean between the comparisons in ruble weights and those in dollar weights.<sup>6</sup> This estimate provides a link to the study of Irving B. Kravis et al. (1982), where international GNPs and some subaggregates are estimated and compared, all based on PPP. The countries classified in this source as Groups IV and V (Kravis et al. 1982, p. 22), from Spain, the poorest, to West Germany, range between 54 and 81 percent of the U.S. level in 1975,<sup>7</sup> and are appropriately compared to the Soviet Union.

Comparisons are also made with the European members of OECD (E-OECD; OECD 1982) and with the industrial market economies (IMEs), as defined by the World Bank (The World Bank 1984). Most of the countries included in all three groups, which overlap one another to a considerable degree, belong to a similar range of GNP per capita mentioned above, though some exceed it.<sup>8</sup> Special comparisons are also carried out with the U.S., as these are of obvious interest.

Finally, further comparisons are made using the set of development equations estimated by Chenery and Syrquin (C & S 1975). These regressions are based on data from some 100 countries in 1959-69. In each case the Soviet level of the relevant variable is compared with the level estimated from the regression and then the differences are evaluated. The C & S regressions use GNP per capita levels in 1964 U.S. dollars, converted from local currencies at official exchange

rates. Kravis (1982) has demonstrated the weaknesses of official exchange rates, but has also found that in most cases the ordinal ranking between countries is not affected. We have estimated the Soviet GNP per capita levels (in 1964 U.S. \$) at about \$300 in 1928, about \$600 in 1950, \$850 in 1960, \$1,250 in 1970, and about \$1,500 in 1980.

The main parameters of the Soviet growth record and the accompanying structural changes in 1928-83 are presented in Tables 1-4. I chose 1928 as the initial point for two reasons: (a) the Soviet Union regained its prewar (1913) production level approximately then, and (b) this was also the initial year of the first Five Year Plan (FYP), which embodied the new Soviet growth strategy. The year 1928 is also the starting point of most Western efforts to estimate the Soviet growth record. As explained in the notes to the tables, most of the estimates relate to national accounts and input changes based on the works of Bergson and the team at the Office of Soviet Analysis (previously the Office of Economic Research) at the CIA. In both cases the data are the culmination of many years of research in academia, research institutes (notably the Rand Corporation), and various U.S. government offices. The present estimates were preceded by many earlier calculations belonging to the same main line of effort.<sup>9</sup> Earlier estimates may differ from the results presented here partly because, with time, more information has been accumulated and methodologies have improved, and partly because the base-year of the series has been moving forward. We discuss alternative esti-

<sup>6</sup>Rates of economic growth in the Soviet Union and in the U.S. are taken from the same sources as for the corresponding data in Table 3.

<sup>7</sup>The figures are the geometric averages of comparisons in U.S. and in the relevant country's prices (Kravis et al. 1982, pp. 230-32, Table 7.2).

<sup>8</sup>The IMEs range from Iceland at the bottom to Switzerland at the top.

<sup>9</sup>Bergson 1953b, 1961; Morris Bornstein 1959; Abraham S. Becker 1960; Stanley H. Cohn 1970, 1976a; Bergson and Hans Heymann, Jr. 1954; Nancy Nimitz 1962; Oleg Hoefding and N. Nimitz 1959; Sally Anderson 1968; Richard H. Moorsteen and Raymond P. Powell 1966; Norman M. Kaplan 1966; as well as Rush V. Greenslade 1976, who led the CIA team for many years.

mates only if the differences are important. Unless otherwise specified, all definitions of variables are in accordance with common Western practice.

### A. *Growth of Output*

The annual average growth rate of GNP during the 57 years since 1928 (line 1, Table 1) was 4.2 percent, or 4.7 percent when the five World War II years are excluded. The growth rate of population over the period (line 11) averaged 1.3 percent, giving 3.0 percent of annual growth of GNP per capita (line 12). All these rates are just above the upper limit of Kuznets' respective ranges for modern economic growth (1966, pp. 490–92) and were achieved despite somewhat faster rates of population growth than Kuznets' "norm." Hence, this growth record clearly qualifies as "sustained." True, since World War II there has been some acceleration in the growth rates of many countries, but the Soviet record is still among the best for such an extended period.

The second major feature revealed by Table 1 is the sharp decline in growth rates over time. GNP growth rates decline more than half, from 5.7 in the 1950s to 2.0 percent in the early 1980s (line 1). The corresponding figures for GNP per capita are 3.9 and 1.1, respectively (line 12). This decline and the very low recent rates have been a special cause for concern among the Soviet leadership for some time (e.g., Mikhail Gorbachev 1986, pp. 29–32) and a focal point of research and argument for students of the Soviet Union both in the West and in the Soviet Union itself. Much of what follows in this survey is related, in one way or another, to this major issue. Is the decline cyclical? Is it normal? Is it caused by the particular Soviet growth strategy? Can the Soviet Union sustain its military position and its internal stabil-

ity with such low rates? Can the trend be reversed, and how?

When compared with the growth record of other countries (Table 2) the Soviet record is generally better during the prewar period and less impressive during the postwar period, and is consistently better for GNP than for GNP per capita.<sup>10</sup> The Soviet record is almost always superior to that of the U.S., even when comparing the Soviet record in 1928–55 to the U.S. record during the last decades of the nineteenth century, when both countries were at similar stages of economic development (Bergson 1963, pp. 6–7). From 1950 to 1980 annual growth rates of Soviet GNP were slightly higher than those for the E-OECD and the IME groups (1960–80 for IMEs). The annual growth rates of Soviet GNP per capita were similar to those of the E-OECD and IME groups. For the decade 1970–80 the Soviet record is even less distinguished by comparison. (All comparisons are along lines 1 and 5 of Table 2.) The comparison of average growth rates for groups of countries in the West conceals the fact that a number of countries have growth records (GNP per capita) superior to that of the Soviet Union, like West Germany, Italy, France, Austria, Spain, Greece and others.<sup>11</sup> Maddison (1982, pp. 43–46, 102–09) articulated the theory that follower countries may have the opportunity to grow faster than leaders. If so, one should have expected the Soviet record to be better than that of E-OECD or IME, but at least since 1950 it was not.

Much of the development literature treats changes in GNP per capita and per

<sup>10</sup> For prewar and postwar comparisons not included in Table 2 see Kuznets 1963, pp. 334–42; Bergson 1963, pp. 6–7; and John Pitzer 1982, p. 20.

<sup>11</sup> Between 1950–1980. See the sources cited in Table 2; Pitzer 1982, p. 20; and Maddison 1982, p. 44.

TABLE 1  
GNP, INPUTS, AND PRODUCTIVITY, 1928-83  
(ANNUAL RATES OF GROWTH)

	1928-83 <sup>a</sup>	1928-40	1940-50 <sup>b</sup>	1950-85	1950-60	1960-70	1970-75	1975-80	1980-85
1. Gross national product	4.2 (4.7)	5.8	2.2	4.3	5.7	5.2	3.7	2.6	2.0
2. Combined inputs	3.2 (3.4)	4.0	0.6	3.6	4.0	3.7	3.7	3.0	2.5

TABLE 1 (continued)

	1928-85 <sup>a</sup>	1928-40	1940-50 <sup>b</sup>	1950-85	1950-60	1960-70	1970-75	1975-80	1980-85
24. Value added of S sector	4.3 (4.6)	6.9	1.9	4.1	4.3	5.3	4.3	3.0	2.1

Sources: 1928-1950: GNP is in "ruble factor cost" of 1937, as in Bergson (1961, Table 51, p. 210). Population: Bergson (1961, Table 60, p. 230). GNP per capita is computed, but also consistent with Bergson (1961, Table 72, p. 264). Inputs are from Bergson and Kuznets (1963, Table 1.2, p. 6). Employment is estimated as closely as possible to full-year equivalents (line 4), and then adjusted to take account of changes in hours (line 3). It includes military forces but excludes forced labor. Capital refers to "reproducible fixed capital" and excludes changes in livestock inventories. Because livestock was declining, the inclusive figures are slightly lower. Weights: Bergson's original weights (1961, p. 19, set A) were used as a base. They assume that return on capital is 20 percent and that land rent amounts to 40 percent of agricultural wages. Because Bergson's weights are for net national product, we have adjusted them to account for GNP by adding the appropriate amount of depreciation to returns from capital and to the total (15 billion rubles in 1937, according to Bergson 1961, p. 144). When also forced labor is excluded the rate of growth of combined inputs comes to exactly 4 percent, and when it is included it comes to 4.3 percent.

End-use categories: All categories at ruble factor cost of 1950 are from Bergson (1961, Table 51, p. 210). Consumption in established prices is from Bergson (1961, Tables 16, 18, pp. 85, 93).

Sector of origin: "A" stands for agriculture and forestry; "M" for mining, manufacturing, and construction; and "S" for all other branches. The data for 1928-50 are from Kaplan (1969, Table 1, p. 5, and Table A-6, p. 123).

1950-85: GNP, population, GNP per capita: 1950-80—Pitzer (1982, Table A-6, pp. 65-67, and Table A-9, pp. 72-74). 1980-85—CIA (1986, Tables 39, 40, 43, pp. 67, 70). All GNP figures are at 1970 factor cost, except for 1980-85, which are at 1982 factor cost.

Inputs, 1950-83: Labor force (line 4) defined as full-time civilian employment *plus* military personnel. The former is from Rapawy (1985, Table 4, p. 8); and the latter from Feshbach and Rapawy (1976, Table 8, p. 132). In line 3 the figures are adjusted to account for changes in hours, as in Rapawy (1985, Table 9, p. 18). Capital inputs are for fixed capital, plus livestock, in "comparable prices" of various years as in Soviet official series (Narkhoz 1971, p. 60; 1983, p. 48). Land is measured by area under cultivation, not farmland or arable land, which are used more commonly in the West. Combined inputs are weighted using Bergson's weights of 0.62 for labor (measured in hours, line 3), 0.33 for capital, and 0.05 for farmland (1982, p. 37). Data for 1980-85 are from (CIA HB, 1986, Table 43, p. 70).

End-use categories (except defense) and sector of origin: 1950-80—Pitzer (1982); 1980-85—CIA, HB (1986, Tables 37, 39, 40, pp. 66-67). Figures on consumption in established prices are from Schroeder and Denton (1982, Tables 3, 4, p. 329). The defense series is from Becker (1986, Table 1, p. 4).

Note: As emerges from the notes below, the data for 1928-50 are not fully consistent with those for 1950 on. We have reason to believe that basic trends are not seriously affected by these inconsistencies. The overall figures for 1928-85 are simply the sum of the changes over the subperiods.

\* Figures in parentheses in this column are calculated on the basis of only 50 years, excluding the World War II years.

\* This period covers World War II years and the following reconstruction period; therefore many of the figures are averages of extremely different magnitudes. For example, GNP stagnated over 1940-44 and grew at 3.6 percent per annum over 1944-50; the corresponding figures for population growth are -2.7 and 0.5 percent, respectively, giving 2.7 and 3.1 percent per year for growth of GNP per capita for the two subperiods.

\* Figures in parentheses in this line (except for 1928-85) are CIA estimates of total factor productivity, based on an alternative set of weights: 0.558 for hours, 0.412 for capital, and 0.03 for land (CIA, HB, 1984, p. 68). For 1980-85 the weights are 0.512, 0.458, and 0.03, respectively (CIA, HB, 1986, p. 70).

For 1950-80—based on five-year averages; for 1950—the average for 1950-52.

main national aggregate, which is more or less the Western concept of net national product (NNP) less the value added of most services. The official growth rate of NNP is 16.7 percent for 1928–37, at 1926–27 prices (Bergson 1961, p. 180), 7.4 percent for 1950–80, and 6.0 percent for 1960–80 at 1950 or later year prices (Pitzer 1982, p. 25). These rates are higher than those estimated in the West. They are explained partly by the definitional differences (about two-thirds of the difference in 1950–80; Pitzer 1982), and partly by Soviet practice, which underestimates price increases in their series. Most notable in Western discussion on the problem is the Soviet practice of introducing new products into constant price series at their high prices at the time of introduction (Gerschenkron 1962, p. 263).<sup>13</sup>

### B. Explaining Growth

Unlike growth itself, which conforms with Kuznets' definition of MEG, the

<sup>13</sup> A discussion of most of the relevant issues appears in Trembl and Hardt (1972, Parts II, V, VI).

A recent Western reconstruction of the Soviet NNP series estimates NNP growth in 1960–80 at 4.9–5.5 percent annually and in 1980–85 at 2.5–2.7 percent (*PlanEcon Report* 1986, p. 25, Table 14). The 1960–80 figure exceeds the GNP rates presented in Table 2 (4.2 percent) by one percentage point, and the figure for 1981–85 is identical to the corresponding GNP figure. The differences in coverage can explain these gaps. This further supports the hypothesis that different treatment of price indices causes some of the gap between official Soviet figures and Western estimates.

At least two Western students of the Soviet economy, William T. Lee (1979a) and Steven Rosefielde (1982), obtain significantly higher estimates of Soviet growth rates. Lee's annual growth estimate of 7.7 percent between 1955–75 and Rosefielde's similar figure are based mainly on accepting the official Soviet NNP series as a measure of growth at constant prices. Their main argument is that the Soviet series should not be deflated by estimates of hidden inflation because the higher prices for new goods, especially equipment, represent quality improvements (Lee 1979a; Rosefielde 1982; see also Rosefielde 1981, 1983). This argument is not accepted by most students in the field (see James E. Steiner 1978, 1982, 1983).

sources of growth of the Soviet economy deviate from the common patterns described by Kuznets. During the entire period, but more so with time, Soviet growth is generated by high rises in inputs and declining growth of overall input productivity. As shown in lines 2 and 7 of Table 1, during the entire period 1928–85 inputs grew at 3.2 percent and contributed 76 percent of total GNP growth, while factor productivity grew 1.1 percent a year, accounting for only 24 percent of total growth. The relative contribution of inputs to growth grew to 80 percent in the postwar period and became its sole component form 1970 on, when productivity completely stagnated or even retreated.<sup>14</sup> The proportions of inputs and productivity are diametrically opposed to those of a normal MEG pattern (Kuznets 1966, p. 491). This divergence from "normal" patterns, as we shall see, lies at the core of Soviet growth patterns and strategy, and is related, as can be seen from the data, to the declining growth trend. Indeed the Soviet experience reveals two sides of this diverging pattern: unusually high growth of inputs and a slow rise in productivity.

**Labor Inputs.** The main characteristic of labor inputs is that they grow over the entire period at a substantially higher rate than population growth (compare lines 3, 4, 11 in Table 1). While the population increased at an annual rate of 1.3 percent, the number of employed was growing 1.9 percent annually, and hours worked grew 1.8 percent. Only during the 1950s did a reverse order prevail. In this way the rise in labor contributed substantially not only to GNP growth but also to the growth of GNP per capita—not a very common phenomenon. Another result of these trends is an excep-

<sup>14</sup> Likewise, total factor productivity growth accounts for only 37 percent of per capita growth in 1928–83, declining over time from almost half to zero (lines 7 and 12 in Table 1).

tionally high rate of participation in the labor force, much higher than in any other country. In 1980 the Soviet participation rate, measured as a ratio of all those working to the population aged 15-64, was 86.6 percent, compared with 66.5 and 70.9 percent in E-OECD and the U.S. respectively (OECD 1982; Feshbach and Stephen Rapawy 1976; Godfrey S. Baldwin 1979; see also Cohn 1970, p. 66). Much of the Soviet advantage in labor force participation rates comes from the exceptionally high rates for women. These rates rose over the period to nearly 87 percent in 1980, again the highest rate in the world. Comparable rates are 48.5 in E-OECD and 59.7 percent in the U.S. (OECD 1982). The actual gap for women is even wider, as few women in the Soviet Union are allowed to hold part-time jobs, while many do in the West.

The main factors contributing to these trends include the elimination of most legal nonwork income sources; the legal requirement that all able-bodied males have a job; and the enlisting of most women into the labor force by wage policies, ideological education and indoctrination, and the opening of new schooling and occupational opportunities.

Despite a rapid rise in the enrollment of youth in all kinds of schools and despite the low retirement age (55 for women, 60 for men), participation rates increased, because nearly half the students were directed to evening and correspondence schools and thus kept in the labor force (Rapawy 1976, pp. 10-12).

Recently, because the rates of natural increase have declined drastically, special efforts are also made to keep retired persons on the job. Finally, the rise in labor inputs was also somewhat slowed by a rather sharp one-time decline in work hours during the 1950s and early 1960s—from 45 to 40 standard hours per

week in industry (Rapawy 1976, pp. 43-55).<sup>15</sup>

One can argue that Soviet-Western comparisons should be made between rates of actual employment rather than participation rates, in order to account for unemployment in the West and its virtual absence in the Soviet Union. The corresponding employment rates for E-OECD and the U.S. for 1980 are 63 and 67 percent respectively, more than 20 percentage points lower than the Soviet figures (Rapawy 1976). The counterargument is that the Soviet Union tolerates disguised unemployment and that this factor shows up as lower labor (and overall) productivity rates. We shall come back to this later.

Even when enlisting labor is entirely successful, rates of growth of employment are bound eventually to gravitate toward the growth rate of population. The secular decline in the latter placed a constantly descending ceiling on the former so that in recent years increments to the labor force are reduced to less than one percent per year and are now bottoming out—down to 0.6 percent per year (Ann Goodman and Geoffrey Schleifer 1982, p. 324). Population and labor force growth rates are much lower among the European nationalities of the Soviet Union and the overall rates are kept at present levels only because of the much higher growth rate of the Moslem populations. These by now account for about 21 percent of the total population, and generate most of the net additions to both population and labor force. Because economic activity is highly con-

<sup>15</sup> On population and labor force issues see Warren W. Eason 1963; Feshbach 1983; Feshbach and Rapawy 1976; Rapawy 1976; Baldwin 1979. The above discussion ignores the relatively small effects of changes in the age structure on trends and comparisons of participation rates. Much of these effects are excluded in any case by relating the labor force to the population aged 15-64.

concentrated outside the Moslem republics and also owing to language problems and lower education levels among the Moslem populations, these labor increments are less readily available for productive employment.

**Capital.** The most outstanding characteristic of Soviet growth strategy is its consistent policy of very high rates of investment, leading to a rapid growth rate of capital stock. The Soviet capital stock has been growing since 1928 at an annual rate of 6.9 percent and of 7.5 percent if World War II years, when capital was destroyed, are excluded (Table 1, line 5). Until 1975 the growth rate of capital remained between 8–9.5 percent, doubling its size every 8–9 years. These high rates, with the implied high rates of growth of investment and its high share in GNP, are all almost without precedent for such long periods (see Table 2) and are the hallmark of Soviet growth strategy. Only since 1976, with a change of policy, were the growth rates of capital allowed to decline to between 6 and 7 percent annually (still very high by international standards). Even so, in view of the much sharper decline in the growth rates of labor, capital now remains almost the sole carrier of the modest growth of the Soviet economy. A more detailed discussion of the underlying policies is presented below.

Before moving on, however, a word on the estimates of the capital series presented in Table 1. These series are taken directly from the *Soviet Statistical Yearbook*, following the accepted practice in the field (Bergson 1983a, p. 69; 1986). For reasons that are still not fully understood, these official statistics do not seem to be subject to the substantial upward bias that all agree affects most similar aggregated "constant price" series.<sup>16</sup>

<sup>16</sup> Direct use may be justified, quite surprisingly in this case, by the rather peculiar Soviet method of compiling the relevant data. The Soviet capital

While this is the accepted view, and the basis of most Western series on Soviet capital, there is a dissenting voice, that of the "British contingent." Based on several recent Soviet sources, they claim that, like most Soviet series on machinery and equipment, the investment series also contains a significant element of inflation, and that therefore the implied growth rates are exaggerated and the implied productivities are downward biased. With the recent low rates of increase in investment, Wiles and Nove even wonder whether the entire growth of investment is not made up of price increases (Nove 1981; Wiles 1982; Philip Hanson 1984; see also Selyunin and Khanin 1987). Some of the responses to these arguments have already been included in the discussion above, and detailed discussions appear in Cohn (1981) and Bergson (1986). One source of difficulty in both the Soviet sources and the debate seems to be a confusion between hidden

---

series is based on two elements: two capital censuses (one in 1959–60 and another in the early 1970s) and interim and following investment series. The methodology that apparently makes these series less afflicted with hidden inflation is the use of "estimated prices" (instead of the usual set of "comparable prices"), prices that are established and monitored by special agencies to avoid price creeping (Cohn 1981; Bergson 1986). One check on the reliability of the Soviet official capital series was provided by independent estimates of Soviet capital series through the heroic efforts of Moorsteen and Powell (1966). These estimates have been discontinued, but for the period covered (up to 1973) they come fairly close to the Soviet series. A second check is provided by ongoing independent CIA estimates of the Soviet investment series, which is also not dissimilar to the corresponding Soviet counterpart (Bergson 1986, especially Table 1; Powell 1979). In the case of investment, however, it is assumed that some element of hidden inflation (between 1 and 3 percent annually) is presented in the series especially during the second half of the 1970s (Ray Converse 1982; Cohn 1981; Bergson 1986, pp. 24–25). The impact of the bias on the capital series is much smaller because a 1 percent bias in the investment series is translated into a much smaller fraction in the capital series, and because the accumulated bias in the latter is periodically corrected by a new capital census.

inflation and increased capital costs per unit of output and between capacity resulting from technological input substitution and inefficiencies (Bergson 1986, pp. 18-25). In conclusion it must be stated that the issue is not yet settled and we must reserve judgment when productivity figures are discussed.

*Land.* Line 6 of Table 1 shows data on the expansion of land under cultivation. The figure for 1928-40 (1.6) reflects the Soviet territorial acquisitions of 1939, and the figure for 1950-60 (3.3) reflects Khrushchev's Virgin Land Program—the drive to raise food production by expanding the sown area, mainly in Kazakhstan and Western Siberia. This and similar drives are part of the contribution of land in the general effort of input expansion.

*Combined Inputs.* The common practice of combining inputs by their factor shares in national income is not readily feasible in the Soviet case. For ideological reasons the Soviet Union does not recognize as an economic category capital charges other than depreciation, and such charges are therefore not included in Soviet national accounting. Instead, until 1966-67 "profits" were calculated as a percentage of production costs and then added to production costs to yield wholesale prices. Since then, profit norms are determined as a percentage of total assets, and a capital charge of 6 percent is levied from profits; however, for various reasons, profit norms vary substantially among branches and individual products. Similarly, rents on land and natural resources were introduced only after 1966-67, but also only half-heartedly (Bornstein 1976, 1978). In order to arrive at appropriate Western type factor shares and, for that matter, national income estimates, all Soviet prices must be transformed from official "established" prices into "adjusted factor cost" prices, stripped from taxes and subsidies

and with an appropriate return on capital and land. The most common alternative practice in the West has been to assign reasonable rates of return and rental values to capital and land, as a basis for calculating their income shares (Green-slade 1976; Bergson 1961, 1963, 1973, 1978a, 1983b, 1985; Moorsteen and Powell 1966; and others). The rates used as returns to (net fixed) capital over the years were 6, 12, and 20 percent, the middle rate being the most commonly used, apparently also by Soviet planners when making project evaluations (Bergson 1983b, pp. 39-41).<sup>17</sup> Depending on the method and on the estimates of labor inputs, each investigator arrives at a slightly different set of weights, and therefore obtains a slightly different series for combined inputs.<sup>18</sup>

The weights used by Bergson to combine inputs are 0.62 for labor, 0.33 for capital, and 0.05 for land. The figures used by the CIA were for up to 1980, respectively, 0.558, 0.412, and 0.03 (CIA, HB, 1984, p. 68; Greenslade, 1976, p. 279), and slightly different for 1980-85. Because capital is growing faster than labor and land, a lower weight for capital generates a lower rate of growth of inputs and a higher residual, that is, productivity growth. Thus the CIA estimates for productivity growth are about 0.5 percentage points lower than Bergson's, as shown in Table 1 (CIA, HB, 1984).<sup>19</sup> The estimates of factor contributions and factor productivity in Table 1 are consistent with the assumption

<sup>17</sup> A new method of calculating factor costs and input shares was recently developed based on the Soviet input-output table, which involves computing factor cost prices under the assumption that all sectors have the same rate of return on their capital inputs (Pitner 1982, p. 40).

<sup>18</sup> See also notes and sources to Table 1.

<sup>19</sup> To illustrate, using a 6 percent return to capital instead of 12 percent would reduce the growth rate of combined inputs over the period 1960-70 to 3.12 (compared with 3.69) and raise that of productivity to 2.14 (instead of 1.51). See Bergson (1983, p. 38).

that the Soviet production of GNP lies along a Cobb-Douglas production function with constant returns to scale. We shall discuss other interpretations of the production data in Section VII.

The pattern of Soviet growth as shown in Table 1 is called *extensive growth* in the Soviet and Western literature. As we have seen, its main characteristic is in generating growth mostly through the expansion of inputs and only marginally through rises in productivity. Indeed, emphasis on input growth has been a strategic decision of Soviet policy makers from the beginning (Alexander Erlich 1967; Bergson 1973; Cohn 1970; James R. Millar 1981; and many others). The other aspect of the extensive model, the relatively small contribution of productivity growth, is clearly an undesirable and unintended outcome. The interesting questions are, to what extent is this failure a systemic problem that can be corrected by radical changes? If so, what are its sources and what are the changes needed? Is it affected by various policy aspects including different elements of the growth strategy? To what extent may it result from the extensive aspect of the growth strategy itself, where the emphasis on maximizing input expansion may have created conditions that are disruptive to productivity growth? More on this later, but not before we review the other structural changes in Soviet economic growth.

#### IV. Structural Changes

According to Kuznets (1966, 1971b), the discussion of structural change covers three aspects: changes in GNP distributed by end uses, changes in the industrial composition of GNP and of inputs, and changes in the extent and structure of external economic relations.

##### A. End Use

A key feature of the extensive growth model is that capital grows faster than

GNP. This is due to the high growth rate of capital, on the one hand, and to low productivity advance, on the other. Consequently, in order to sustain the growth rate of capital, the share of investment in GNP, in constant prices, must grow continuously. The share in current prices can move in both directions, depending on the change in the relative price of investment goods vis-à-vis other GNP uses.<sup>20</sup>

As shown in Table 3, the share of gross fixed investment in GNP, when defined in constant 1970 factor cost prices,<sup>21</sup> rises continuously and rather steeply. From 1950 to 1980 it rose from 14 to 33 percent of GNP (line 12). This manifests itself in a faster rise of investment compared to GNP growth (see Table 1); however, when measured in current prices, the share is fairly constant from about 1960 on—which means that at least since then the relative prices of investment goods have been *declining*. Since 1960, the investment shares are stable at 27–29 percent (Table 3, line 1). These are comparatively high figures; very few countries have sustained such burdens for so long. Kuznets estimates that “normal” investment shares reach about 20 percent

<sup>20</sup> The relation between  $I$  (investment),  $K$  (the capital stock), and  $Y$  (national product) in real terms is given by:

$$I/K = (I/Y)(Y/K).$$

Let us describe growth by  $\dot{Y} = \alpha\dot{K} + \beta\dot{L} + \dot{A}$ , where  $(\dot{\cdot})$  denotes growth rates,  $L$  is labor, and  $A$  is the level of technology.

Under intensive growth,  $\dot{K} < \dot{Y}$ , so  $Y/K$  rises over time. In order for  $I/K (= K/K)$  to stay constant,  $I/Y$  must decline, i.e.  $\dot{I} < \dot{Y}$ .

Under extensive growth,  $\dot{K} > \dot{Y}$ , so  $Y/K$  declines and a constant  $I/K$  implies a rising  $I/Y$ .

The share of investment in GNP in current prices may be written as  $I_c/Y_c = IP_c/YP_c$ , where  $c$  stands for “in current prices” and  $P$  for “price level.”

A change in the relative price of  $I$ , due, for example, to faster technological change, may slow down the rise of  $I/Y$  in real terms.

<sup>21</sup> Factor costs are calculated by adding subsidies to and subtracting (turnover) taxes from established prices. No adjustments are made to make factor prices scarcity prices as in “adjusted factor costs.”

GNP at an advanced stage of development (1966, pp. 496-97). Indeed, most of the figures for various groups of countries are about 20 percent (Table 3).<sup>22</sup> Compared with this estimate there is an excess Soviet investment of about 8 percentage points of GNP. The only other countries belonging to the control group which invest that much or more, and for such extended periods, are Japan and Norway (OECD 1982, p. 60). Another characteristic of the growth orientation of Soviet investment is that less than 20 percent goes to residential construction compared with more than one-quarter for E-OECD (OECD 1982; Cohn 1976b, p. 452). To the basic figure of 28 percent for fixed investment one must add 2-3 percent of investment in inventories and 3 percent spent on Research and Development (R and D), to get a grand total of about one-third of GNP in current prices for investment.

Before we discuss the implications of the above for consumption, a word on the share of GNP allocated to general government uses, especially *defense*.<sup>23</sup> The most recent estimates of the share of defense spending in Soviet GNP (the defense burden) are between 15-17 per-

cent for the early 1980s, estimated in 1982 prices. After a sharp decline in the share of defense following Stalin's death, it resumed a monotonic climb from possibly less than 10 percent in the late 1950s to about 13 percent in 1970.<sup>24</sup> This rise in the defense burden represents a combination of varying proportions of increases in real spending at rates higher than GNP growth, and an apparent monotonic increase in the relative price of defense. The first factor was more important up to the mid-1970s, when a major policy decision trimmed the real annual growth of defense spending from about 4 percent to 2 percent with almost a freeze on growth of the procurement of weapons (see Table 1, line 14). Increases in the cost of defense relative to economy-wide price rises have been more important and more pronounced since the early 1970s.<sup>25</sup> These cost increases stem from the rising level of sophistication of the new weapon systems and from the difficulties encountered by the Soviet system in coping with them (Becker 1986).

By all standards, the defense burden on the Soviet economy is especially high. As shown in Table 3 (line 11), it is at least three times higher (and often more than that) than for the group of industrial countries. It is also about three times higher than the defense burden of the United States. This exceptionally high defense share reflects both Soviet aspirations to achieve world-power status and sustain its position in the arms race, and the need to support this effort by a na-

<sup>22</sup> The figure estimated from the C & S regressions, 3 percent, includes investment in inventories, as do the World Bank figures.

<sup>23</sup> See note "a" to Table 3. Soviet defense spending usually defined in Western statistics in two ways. The lower range of spending estimates is based on the definition of defense used in the U.S. and includes the U.S. equivalents of (a) national security programs funded by the Department of Defense, (b) defense-related nuclear programs, (c) selective service activities, and (d) defense-related activities of the Coast Guard. This definition is broadened in the upper range to include other activities that the Soviets may view as part of their defense effort: (a) internal security, (b) construction and railroad troops, (c) civil defense (in part), (d) military assistance, and (e) military stockpiling. Both definitions exclude military pensions and veterans' benefits.

The estimated defense spending according to the second definition is usually larger by 2 percent of GNP than the estimate based on the first definition. The figures in Table 3 rely on the first definition which is better for comparison purposes). See U.S. Congress 1981, pp. 129-30; CIA 1981, p. 10.

<sup>24</sup> The figures for 1970 and 1982 are in established Soviet prices as estimated in the West. For years before 1970 and between 1970 and 1982 the shares are usually calculated in 1970 prices. The inferences about the behavior of current price shares are made on the basis of estimates of relative price rises by Becker (1986, pp. 16-18); CIA (1986, pp. 35-37), and others. See further discussion on the data below.

<sup>25</sup> It is estimated that the price level of defense has been rising since 1970 at about 3 percent per year as compared with a general price rise of about 2 percent (CIA 1986, pp. 33, 35).

Sources: The Soviet Union: 1928, 1950—Bergson (1961, Table 3, p. 46); 1960-80—CIA (1983, Tables 5 and 18). Constant factor cost shares are from CIA (1983, Table 9). The figure for food consumption is from Schroeder and Edwards (1981, p. 20). Defense expenditures for 1950-70 are from Becker (1986, Table 2, p. 14); the figure for 1980 is from CIA (1986, p. 35). Other countries: "Kravis"—Kravis et al. (1982, Table 1-6, p. 18); "E-OECD"—OECD (1982, various tables); C & S—Chenery and Syrquin (1975, Table 3, pp. 20-21). Defense shares are from CIA HB, (1984, Table 22, p. 47).

Note: E-OECD and USA data are based on GDP rather than GNP. It is assumed that the distortions created by taxes and the exclusion of proper factor payments are much more significant in the Soviet Union than those created

tional product that is about half the size of its chief adversary. While the defense effort cannot be considered an integral part of a "socialist growth strategy" in an abstract sense, it clearly has a very strong impact on the realities of the Soviet growth pattern.<sup>26</sup>

<sup>26</sup> The above discussion over the relative size of the Soviet defense effort represents the current estimates and views of what may be called the mainstream in the field including the CIA which, for obvious reasons, invests most of its resources in the investigation of this question. Comprehensive surveys on the methods of estimation and the nature of existing disagreements can be found in Becker 1986; Richard F. Kaufman 1985; Donald F. Burton 1983; and Hanson 1978a. The major method of estimation of the Soviet defense effort is the building-blocks

method, starts from estimates of physical series of the production of weapons, employment of military personnel, and so on. These series are then valued and aggregated by estimates of their U.S. dollar costs in the United States. Finally, estimated ruble/dollar price ratios are employed to transform the dollar into ruble series. The problems and difficulties encountered at every step may explain why twice in one decade the CIA came out with major revisions of its own estimates. Once, in 1973, the revision consisted mostly of near doubling the ruble cost of more or less unchanged dollar estimates of Soviet defense spending. The second major revision, in 1983, involved scaling down the estimates of real rates of growth, mostly of weapons procurement. The major dissenting views are, on one side, those of Lee (1977a, 1977b, 1979b) and Rosefield (1982), who consistently come up with higher estimates of Soviet defense spending, its growth rate, and its GNP shares (see also Birman 1984). They claim that what the CIA considers cost increases are real increases in

by taxes in other countries. In 1970, the consumption share in the Soviet Union at factor cost was lower by one percentage point than that estimated at established prices (54.2 and 55.1 respectively; CIA 1983, p. 8; Pitzer 1982, p. 21). OECD, IMEs, and USA data are as in Table 2, except that the IMEs figure is the median value for the group. Kravis' data are simple averages for two groups of countries; the left-hand figure is the average for Italy and Spain, and the right-hand figure is the average for nine industrialized countries (eight European and Japan), excluding the U.S.; C & S stands for Chenery and Syrquin 1975. The figures in this column are the relevant levels as estimated from their equations for a level of GNP per capita of about \$1,500 (of 1965), the approximate level for the Soviet Union in about 1980 (see text p. 1776).

Consumption includes the provision of communal services, mostly education and health, by governments. Household consumption excludes services supplied by governments.

As apparent from the table and the related discussion in the text, the sum of the shares of investment (lines 1, 2, and 3), consumption (line 4), civilian administration (line 9), and defense (line 11) add up to more than 100 percent in all years since 1970. This results from the fact that expenditures covered by "other" government expenses include, in the reconstruction of Soviet GNP in the West, only part of the Soviet defense expenditures. Western analysts believe that the amounts spent on defense but unaccounted for in "other" government expenses (line 10) are allocated and reported according to the Soviet practice in other categories, fixed investment, changes in inventory, R and D (where over half the expenditure is probably spent on military R and D), and consumption (military subsistence and pay). See Becker (1968, Ch. 7); JEC (1982b, pp. 121-23). It is also possible that in the reconstruction some defense expenditures are left out of total GNP. Western analysts are not sure how to allocate the rest of defense among other uses, and thus are also unable to reallocate them to defense. Therefore, there is no breakdown of Soviet GNP by end use with defense as one of its categories (CIA, 1983). The above implies that the shares of consumption (and household consumption) and of investment (especially R and D and inventories) are overstated by a few points for purposes of international comparisons. But this does not significantly affect any of the observations in the text.

<sup>a</sup> Including changes in livestock.

<sup>b</sup> — = not available.

<sup>c</sup> R and D figures for the Soviet Union in 1928 and 1950 are included in the government budget. For other countries the figure is included in other categories.

<sup>d</sup> Food excludes beverages and tobacco.

<sup>e</sup> In 1928 and 1950, includes defense expenditures as recorded in the budget, that is, only part of such outlays (see text). In 1960-80, in addition to part of all defense expenditure the category may contain other (small) unspecified government expenditures.

<sup>f</sup> For 1928 and 1950 the data are official Soviet figures as recorded in the budget. The figure in parentheses for 1950 is from Becker (1966) and includes, as do the figures for 1970 and 1980, all defense expenditures, some of which are recorded in the various investment categories (including inventories and R and D) and consumption. The defense share is recorded at factor cost, not in established prices as are the rest of the figures in the table. The bias created is small.

Government administration and general government collective services, such as internal security, take up only 2-3 percent of GNP in current prices and do

not require special attention. This figure may appear far too low for a system that is the symbol of bureaucracy and internal security, but I believe it is of the right order of magnitude.<sup>27</sup>

The final claimant on GNP is *consump-*

spending reflecting quality improvements. It follows that the differences in estimates of the defense shares in current prices are now relatively narrow. Dissents on the other side of the estimates are mainly by Franklyn D. Holzman (1960, 1962), who questions the finding about rising relative costs of defense, in contrast with Gerschenkron's theory of declining costs of advanced products (1947), and also with claims of the relatively higher efficiency of defense production in the Soviet Union. All estimates, however, agree that the share of defense in the Soviet Union has been exceptionally high in comparison, and this is the main relevant point for the purpose of this review.

<sup>27</sup> I tried to check this point (Ofer 1973, Chs. 3-4), and received a dissenting rejoinder (Gertrude E. Schroeder 1976). I stand by my conclusion that labor and money resources devoted to civilian public administration are, at least, not strikingly large even by the standards of market economies. Some support for this claim is presented in Table 3 (lines 7, 8) where "normal" shares for government services, with communal services, are only slightly excessive in the Soviet Union, considering that they include the bulk of the large defense outlays. See also Schroeder and

tion, whose share has declined over the years, in current prices, from 73 percent in 1928 to 64 percent in 1950 down to 55 percent in 1980. Consumption here includes household consumption financed by disposable income, and "communal services," chiefly education and health, provided almost entirely free of charge by the government.<sup>28</sup>

The share of consumption in GNP is lower in the Soviet Union than in most countries, typically by at least ten GNP points, which are taken up as seen above by investment and defense. The comparisons are presented in Table 3; some are for private consumption and others for household consumption only—that is, without communal services. The typical Western level of household consumption is 60–65 percent compared to the Soviet 50 percent, while the typical level for total private consumption is 65–71 percent compared to the Soviet 55 percent.<sup>29</sup>

Figures on the increase in consumption per capita and per worker are presented in Table 1, and international comparisons are made in Table 2. Growth rates of consumption and of its components are presented at factor cost and at established prices. Factor costs are consistent with the GNP series, and established prices, paid by consumers, better represent changes in welfare. During 1928–40 consumption per capita rose by only 1.4 percent, but the entire rise is credited to communal services. Household consumption per capita actually declined (Table 1, lines 18–20). During those years the Soviet regime was engaged in rapid expansion both of medical

services and of the educational system, an intensive effort of investment in human capital alongside that in material capital. The combined volume of these two services quadrupled in 1928–40 (line 18). The fact that household consumption per capita declined somewhat over that period is an extreme manifestation of Stalin's industrialization policies. After 1950, consumption per capita was allowed to grow more rapidly for almost three decades, creating a real revolution in the Soviet standard of living, a revolution that goes beyond the quantitative rise. The estimates do not capture the improved consumption environment and the variety and quality of goods and services that together brought a radical change in the quality of life in the Soviet Union; however, it should be borne in mind that this started from very low initial levels. Growth of consumption per capita has tapered off recently, following the trends in GNP, reaching the very low annual rate of about 1 percent and less. The apparent contradiction between increasing consumption levels on the one hand, and declining consumption shares in GNP on the other, reflects a decline in the relative prices of household consumption (primarily the result of reducing sales taxes and raising subsidies) and the fact that the growth rate of consumption over most of the period, even after World War II, was kept below that of GNP (Table 1).

All along, except for one interval, consumption per worker rose more slowly, and household consumption per worker even declined substantially in 1928–40 (Table 1, lines 17 and 4). While GNP per worker measures productivity, consumption per worker is a better measure of overall consumer welfare than consumption per capita because it also takes account of the amount of work effort or leisure forgone.

Soviet growth rates of household con-

<sup>28</sup> The rate of decline shown here may be slightly exaggerated because estimates for earlier years (Janet G. Chapman 1963; Bergson 1961) may be slightly upward biased according to more recent methodology.

<sup>29</sup> Similar comparisons and results are presented by Schroeder and Imogene Edwards 1961, p. 26; Bergson 1963c, pp. 205–6; and Pitzer 1962, p. 22.

sumption per capita for 1950-80 are somewhat higher than the E-OECD average for the same period and than those of IMEs for 1960-80. Soviet rates are equal to the other groups of countries (Table 2, line 12). E-OECD rates per worker are, however, equal to or higher than Soviet rates (lines 13 and 14), whether the former are presented per labor force member or per worker. In both comparisons the U.S. rates are lower. At least 6 OECD members, and possibly 14, have higher per capita rates, and more countries have higher rates per employed person (OECD 1982).<sup>30</sup> The welfare implications of unemployment aside, the Soviet citizen seems to be catching up with his Western counterpart very slowly, if at all.

The smaller and declining share of consumption in Soviet GNP brought about a situation in which the *relative level of consumption* of the average Soviet citizen, when compared across countries, is lower than that of GNP per capita. According to Schroeder and Edwards, Soviet per capita consumption level in 1976 is just above one-third of that in the U.S. (1981, p. 19), compared with 45 percent of GNP per capita, and 36 percent of GNP per employed person (Schroeder and Edwards 1981, p. 26). The actual figure for the Soviet citizen is bound to be even lower, because the comparison necessarily fails to take into account the limited variety and choice of goods, the effort that must be invested in shopping, the lines, the perennial shortages, the lower level of retail trade services, and possibly the unaccounted for lower quality of many goods and services (Bergson 1983c; Schroeder and Edwards 1981; Schroeder 1982). Birman (1983), in a criticism of Schroeder and Edwards' paper, estimates Soviet per capita con-

sumption at only 22 percent of the U.S. level. This is probably much too low, but some of Birman's points are valid and are mentioned above. One additional point is that when comparing consumption of retail goods in the Soviet Union and the U.S., the huge differences in the quality of retail services is disregarded (Birman 1983). This difference means extra time pressure on the Soviet consumer, who must spend many nonwork hours attempting to obtain retail services.

### B. Sector of Origin and Urbanization

More than 50 years after the initial industrialization drive, the Soviet Union still lags behind the West in some of the main characteristics of structural change. Comparative data are presented in Table 4. The level of urbanization was 63 percent in 1980 compared with a C & S "norm" of 70 percent for its level of development, and an average of 78 percent for E-OECD countries. The gap is actually even wider, because within the Soviet Union very few places are defined as rural unless they are either collective or state farms, whereas in most other countries many small nonagricultural locations are classified as rural. Correspondingly, more than a quarter of the persons employed in the Soviet Union (in 1980) still worked in agriculture, compared with the "normal" figure of about 15 percent, and 20 percent of the Soviet GNP is still derived from agriculture, compared with "norms" of 4-12 percent.<sup>31</sup> On the urban side of the industrial structure there is, first, a deficiency in labor and GNP shares of the service sectors, in each case by 10-15 points, and only normal shares (not higher) for the M sector including manufacturing, min-

<sup>30</sup> Similar evidence is presented by Bergson 1983c, Schroeder and Edwards 1981, and Schroeder 1982.

<sup>31</sup> GNP shares should be compared across countries in current prices, so the following refers to lines 5-8 in Table 4. Labor force shares are compared in lines 1-4.

TABLE 4  
INDUSTRIAL STRUCTURE BY SECTOR OF ORIGIN AND URBANIZATION

A. Shares in Labor Force and GNP (percentage)									
	Soviet Union					C & S		E-OECD	
	1926	1940	1950	1970	1980	1950	1980	1950	1980

Sources: Soviet Union: Labor shares, 1926, 1940—Ofer (1973, Table E-1, p. 187); 1950-83—Rapawy (1985, Tables 1, 4, pp. 1, 8). Product shares, 1937, 1950—Kaplan (1969, Table A-6.1, p. 123); 1960-80—in current prices; 1950-80—CIA (1983, Table 10, p. 10). Urbanization levels, Narkhoz—various years. Other countries: C & S, Chenery and Syrquin (1975, Table 3, pp. 20-21); E-OECD and U.S., OECD (1982, various tables).

Note: Here, too, as in earlier tables, data for the period up to 1950 are not fully consistent with later data. The definition of the sectors is as in Table 1. "1950" and "1980" under C & S stand for GNP per capita values of approximately \$600 and \$1,500 of 1965. The "range" in Part B of the table stands for changes from a level of GNP per capita of about \$70-\$1,500. "1928-80" covers the income range of \$300-\$1,500. In each case the dates attached correspond to the approximate time when Soviet GNP per capita was at the corresponding level. Data for E-OECD are based on GDP and represent the structure of the sum of the entire group of countries.

<sup>a</sup> Data for 1940 is for 1937. Data for GNP in current prices for 1950 is in 1955 prices. The bias created must be very small.

ing, and construction. Here, too, the figures in the table are not exactly comparable, and make the Soviet Union seem closer to "normal" than it really is.<sup>32</sup> The word *only* is used above in referring to the M shares because one would expect to find relatively high levels of activity in that sector in the Soviet Union. The lower than normal service shares stem from, among other things, a persistent Marxist-doctrinal bias against service activities. Most services to people, including government administration, are considered "nonproductive."

When the emphasis is shifted from the Soviet economy today to comparisons of changes over time, one finds that by and large the Soviet Union has followed a normal pattern of change, and indeed quite rapidly (Table 4b). Between 1928 and 1980, and even since 1950, most changes are equal to or larger than those called for by estimates derived from the C & S equations. This is even true with respect to labor and product shares. On this basis Kuznets and others judged the changes to be normal in direction and *intensive* in pace (Kuznets 1963, pp. 345-47; Millar 1981).

How can one reconcile this apparent contradiction between a normal pattern of structural shifts and a biased structure still in effect in 1980? There are a number of possible explanations. First, it has been shown that in 1928 the industrial structure of the Soviet economy was already tilted in the same direction as it is today, but much more so (Ofer 1973, 1976, 1977, 1980c). In fact the industrial distribution of the labor force in 1928 resembled the one shown by C & S for countries with a per capita income of \$70, not \$300, as was estimated for the Soviet Union. This finding may explain the dif-

ferent Soviet structure by long-range historical factors, or simply because the USSR needs more time to catch up. Both explanations are partly valid, but they cannot explain the entire gap. Based on comparative analysis with a more limited group of countries, I have shown that even when the historical legacy is taken into account, until the mid-1960s structural changes in the Soviet Union were not as rapid as has been typical elsewhere: Urbanization levels, the decline in the A labor share, and the rise in the S labor share were all below the norm. It was claimed that the biased structure and the slow changes reflected two major strategic development decisions: first, to go with the smallest possible increase in consumption levels, including minimum development of agriculture and services, and second, to concentrate most investment resources in industrial growth while limiting them in all other sectors including agriculture, urban infrastructure, services, and even transportation. Such a strategy implies slower urban growth, less than normal rural-to-urban migration, higher than normal labor-to-capital ratios in agriculture and services, and higher ratios in manufacturing. Because technology and productivity are at least partly embodied in capital, it also follows that both the A and the S sectors lag in productivity relatively to the M sector.<sup>33</sup>

Since the mid-1960s structural changes accelerated and moved closer to normal

<sup>32</sup> In the C & S data, mining and quarrying are included in the A sector, and the Soviet labor series are for full-time annual equivalents, which usually reduces the estimate for agriculture.

<sup>33</sup> This can be seen from the changes in the implied sectoral relative prices computed from GNP shares in current and constant prices. Between 1950 and 1980 relative A prices (to GNP) increased 38 percent, relative M prices declined 24 percent, and relative S prices rose 52 percent—based on data on the distribution of GNP by sector of origin in current (established), and constant, 1970 prices in CIA (1983, Table 10, p. 10). These relative price changes may also reflect government policy in raising A prices and resisting raising M prices even when such changes were warranted.

patterns. This is especially true of urbanization and of the labor share in agriculture, but also, to some extent, of services. The main causes of this change were the shift to more favorable policies toward agriculture and the emergence of labor shortages, especially in manufacturing and related branches. The more tolerant attitude toward the growth of consumption also contributed to this result.

### C. *External Economic Relations*

Foreign trade and aid, and the movement of people, capital, and technology have played important roles in the theory and viability of economic development everywhere. External economic relations strongly affect both the rate of growth and the pattern of the accompanying structural changes. Have Soviet external relations, like other aspects of Soviet industrialization, been atypical? And if so, what are the growth and structural implications?

A number of difficulties arise in comparing the Soviet Union's external economic relations with typical patterns of modern economic growth. First, there is no single unique pattern for all countries, but a variety of patterns depending on the strategy chosen (e.g., export lead or import substitution), the relevant time, and world conditions (Kuznets 1966, Chs. 6, 10; Chenery and Syrquin 1975, Chs. 4 and 6). Second, on the Soviet side there is its large size and abundance of most raw materials that make it almost *sui generis*. In addition to the above objective problems, there is also the difficulty in interpreting official Soviet trade statistics: Soviet trade is conducted by the Ministry of Foreign Trade, which has been until very recently virtually the sole Soviet trader in foreign markets. Internally, the Ministry buys and sells at domestic prices, but trade is conducted in international transferable rubles, reflecting prices related to world

prices, but different from domestic prices (Trembl 1980; Trembl and Kostinsky 1982). This obscures the volume of trade relative to the size of the economy and its economic impact. Lack of official data on trade in services and on the capital account adds to such difficulties.

As a rule, large countries engage less in international trade, which also has a smaller effect on their internal economic structure. In spite of this, Soviet external economic relations have attracted much attention in Western literature. There are two reasons for this. First, there is the natural interest of other countries as potential partners or competitors. Second, there is interest in the theoretical and empirical aspects of the conduct of trade by a centrally planned system, its internal and external effects, and on how trade is conducted when internal prices are so extremely remote from world prices. In view of the limited effects of trade on large economies, this survey will restrict itself to a brief discussion of the main issues. (Some recent surveys of the literature are Holzman 1974, 1976; Edward A. Hewett 1982; Marshall I. Goldman 1975; Michael R. Dohan 1979.)

*Autarky.* The first notable feature is the small amount of external economic aid the Soviet Union has received compared with many other countries, even with pre-Revolutionary Russia. There was very little private inflow of capital during the early 1930s, and with the exception of lend-lease during World War II and forced transfers of resources from East Germany and Eastern Europe thereafter, there was very little government-to-government aid. Growth was self-financed all the way, mainly through compulsory saving.

Second, no matter how it is estimated, the volume of Soviet trade up to the mid-1950s was below reasonable international standards, and also below trade levels achieved during the Tsarist era. Holzman (1963, p. 290) estimated the share of ex-

ports in national income at 10.4 percent in 1913, 3.1 percent in 1929, 0.5 percent in 1937, and 2 percent in 1955. These figures, since 1929, are small enough to justify the claim of autarky even for a country the size of the Soviet Union. But since 1946 Soviet trade figures have been growing very rapidly in real terms—13 percent annually in the 1950s, 8 percent in the 1960s, and 9 percent in the 1970s—thus constituting a rapidly increasing proportion of GNP. Soviet trade shares were estimated by Trembl (1980), following necessary price adjustments.

An attempt to compare Soviet trade shares with "normal" patterns is made with the help of the C & S equations. After an adjustment of the C & S estimates for GNP size, and taking into account the secular rise in world trade since 1965 (the base year for the equations), and on the basis of Trembl's estimates with some adjustments, I estimate that in 1965 the Soviet trade ratios (imports *plus* exports *divided by* GNP) were about one-third below the "norm," and that by 1980 they had probably caught up and closed the gap. It is possible that by 1980 Soviet commodity trade reached 5-20 percent of GNP (based on Trembl 1980), which may be similar to the U.S. ratio (The World Bank, *WDR*, 1984, p. 27).<sup>34</sup>

The expansion of trade after World

War II was first concentrated in trade with the newly established socialist regimes in Eastern Europe, but since the mid-1950s trade with Third World countries and then also with the developed West began growing rapidly. Autarky, in the sense of trade proportions, was thus part of Soviet policy only up to World War II or shortly thereafter. It was partly the Soviet Union's large size, partly the concentration of trade within Eastern Europe, and partly—perhaps most important—the way it conducted trade (the isolation of the economy from world market prices and from external connections, and inconvertibility of the ruble) that helped sustain the autarky claim or image (Holzman 1974). The quite rapid development of significant trade shares by the much smaller Eastern European socialist countries further contributed to weaken the assumed close association between autarky and the socialist system (Holzman 1974, 1976).

*The structure of Soviet trade* is shaped by the Soviet Union's growth strategy, its natural endowment, and its choice of partners. Here, too, size vitiates simple comparisons. The evolution of the structure of Soviet trade differs in at least three ways from the patterns in other countries trading along the same development road. First, the balance of trade in agricultural products turned negative rather early, in 1958. By the 1970s, it was 18 percent in favor of imports with almost no exports.<sup>35</sup> The change is much more extreme than for OECD countries which today still have a balanced trade in agricultural products. The contrast is especially marked in view of the traditional position of Russia as a large exporter of such goods.

Second, the Soviet Union developed a large export capacity of nonagricultural raw materials and other natural resources, including oil and gas. From a

<sup>34</sup> Trembl's figure for commodity trade as a percentage of Soviet national income, both in domestic established prices, is 14.9 for 1970 and 21.1 for 1976. Since 1976 it has grown further as trade has been expanding faster than national income. An adjustment of the denominator from "national income," Soviet definition, to Western-type GNP reduces the Soviet trade proportion 10-20 percent (Bergson 1980, p. 207). In his comment on Trembl's paper, Bergson (1980) raises some other issues, most of them about the proper prices that should be used, that may reduce the Soviet trade proportion even further. Hewitt (1983, pp. 274-76) also questions Trembl's figures, first, because he doubts the correctness of the prices used, and second, because he believes that Soviet exports in domestic prices contain a high proportion of tariffs that must be eliminated. See also Trembl and Kostinsky 1982.

<sup>35</sup> The percentages here and below are for net flows of exports minus imports as percent of total exports.

negative balance until World War II, the Soviet Union moved to a positive balance of about 20 percent since the early 1960s. During the late 1970s and early 1980s more than half of Soviet exports belonged to raw materials. Most industrial countries have a negative balance in raw materials (the U.S. has a 20 percent negative balance).

In terms of all primary products combined, agricultural and nonagricultural, the Soviet Union has developed in a peculiar cycle: Starting with an export surplus based on agriculture, it reached a balance in the 1930s and 1950s, and then, in the 1960s, developed a large surplus based on raw materials. This surplus has been declining lately owing to a rise in Soviet dependence on food imports, and not to a decline in the export of new materials. The Soviet Union still maintains a small export surplus of primary products, whereas most industrial countries run a large import surplus. OECD had a 20 percent net primary import surplus in 1980. According to Chenery and Syrquin (1975), the exports of a country like the Soviet Union should be made up of 30 percent primary goods and 70 percent industrial goods; the actual Soviet proportions are almost the reverse. It should be mentioned that data or trade presented here do not include trade in arms, data not reported by the Soviet Union. With arms the proportions of both imports and exports should be higher and the export deficit somewhat lower.

This leads to the final point: With rapid industrial growth the Soviet Union would have been expected to be a large net exporter of machinery and equipment. It is, however, a large net importer of machinery, with a deficit of over 20 percent in the late 1970s and early 1980s (CIA HB 1985, pp. 97-98, Tables 62, 63), in contrast with most industrial countries, which are net exporters of machinery and equipment. (Most of the data in this para-

graph are from Holzman 1963; Trembl 1980; Hewett 1983; The World Bank, WDR 1984; OECD 1983; and Bornstein 1985.)

Most of the features of Soviet trade structure are explained in the literature by its broad comparative advantage. The Soviet Union and other socialist countries rapidly developed a relative disadvantage in food production and a regional food deficit. This comparative disadvantage resulted from the socialist industrialization strategy including the neglect of agriculture (Ofer 1976, 1980a; Goldman 1983, Chs. 3, 4). The Soviet Union's relatively harsh climatic conditions are also seen as a justification (Russell Ambroziak and David W. Carey 1982). The Soviet comparative advantage in raw materials and, lately, in energy products, is based first of all on the availability of resources, but possibly also on the mode of production such as high capital intensity, only moderately advanced technological sophistication, and large-scale production, all in line with Soviet systemic tendencies. Finally, and most important, the Soviet failure to reach Western technological frontiers in many sectors prevented it from shifting its export structure in the direction of machinery and equipment (M & E). The same applies to consumer goods with the added reason that it is also a low-priority sector. The Soviet Union exports M & E mainly to its East European fellow-members in Comecon and to Third World countries and imports more advanced technology from the West, and from advanced Comecon countries. The opening up of trade with the West has been motivated by Soviet Bloc demand for agricultural products and high-technology M & E. For this reason the structure of Soviet trade with the developed West is even more tilted than total Soviet trade in the directions described above (Bornstein 1985, Ch. 5).

**Technology Transfer.** The most studied and discussed aspect of Soviet trade in recent years is the impact of technology transfers (TT) from the West to the Soviet Union. TT from advanced countries is considered to be the major late-comer's advantage (the advantage of being backward; see Gerschenkron 1962, Ch. 2; Maddison 1982) derived from external economic relations. It serves the dual purpose of raising the technological level of current production and providing the basis for the development of an indigenous R and D sector capable of eventually taking over. For reasons discussed later, the Soviet indigenous R and D capability has not developed to a level that would put it on a par with advanced countries, and partly for this reason, Soviet dependence on Western technology has been prolonged to the present and is expected to continue into the future.

With the very important exception of the early 1930s, lend-lease during World War II, and the massive importation of German technology after the war, most of the TT to the Soviet Union until the early 1960s was obtained by "reverse engineering" of individual pieces of equipment acquired and by the collection of relevant information. This strategy is inexpensive in terms of foreign currency but very costly in terms of domestic resources. It was only under Khrushchev that TT took the form of importing large quantities of equipment and entire plants, some under turnkey arrangements, and other forms of transfer (such as patents, licensing, and training agreements; Bornstein 1985, Ch. 3).<sup>36</sup> Even so, direct Western investments had not been permitted until very recently, and both the prolonged presence of Western

experts in the Soviet Union and the training of Soviet scientists and technicians abroad are strictly restricted.<sup>37</sup>

Difficulties in incorporating Western technology into the Soviet production system and the failure to use it as a catalyst for domestic R and D activity are among the explanations for the decline in imports of technology after 1977 and contributed to what Hanson dubbed "the end of import-led growth" (1982a). As things stand now, there seems to be no better alternative and one should expect Soviet effort to resume such imports when conditions prove favorable.<sup>38</sup>

**Benefits from Trade.** Even though the broad structure of Soviet trade is consistent with the principle of comparative

<sup>37</sup> Many attempts have been made to estimate quantitatively the benefits to the Soviet Union from technology imports from the West. One factor that limits potential gains is, again, the large size of the Soviet economy. Any reasonable amount of credit or equipment can provide only a small proportion of total Soviet investment in new equipment. For example, at its peak, in 1975-77, imports of Western M & E came to no more than 6-7 percent of Soviet domestic investment in M & E (Hanson 1982a, p. 136). Attempts to estimate the effect of such imports using production function analysis and other methods arrived at conflicting results, ranging from an estimate that Western equipment may be more than ten times as productive as domestic M & E (Green and Levine 1977; Green 1979) to estimates that showed no differential effect (Martin L. Weitzman 1979; Yasushi Toda 1979). Hanson, following Stanislaw Gomulka (1977; and Gomulka and Jerzy D. Sylwestrowicz 1976) offers an upper-limit estimate of the contribution of imported M & E from the West at 0.5 percent growth of industrial production which, he claims, while modest, "is not to be sneezed at" (Hanson 1981, Ch. 9). Half of 1 percent of industry probably translates into one-quarter of 1 percent of GNP. But considering that total factor productivity, including in Soviet industry, was recently estimated to be negative, such imports may deserve more than a non-sneeze.

<sup>38</sup> Recent surveys and analyses of technological transfer are Hanson 1981, and his 1976, 1978b, 1982a, 1982b papers; Gomulka and Nove 1984; Bornstein 1985; see also George D. Holliday 1979; Robert W. Campbell and Paul Marer 1974; Hewett 1975; Holliday 1982, 1984. See also references in the discussion on technological change in the Soviet Union, below.

<sup>36</sup> One of the most innovative of Gorbachev's reforms is in opening up possible joint Western-Soviet ventures in the Soviet Union. Rules and details are now being worked out.

adverse internal conditions that constrain its growth potential (Gerschenkron 1962, Chs. 1, 2 and postscript). Second, catching up is the expected outcome of the introduction of the more efficient, so it is claimed, socialist system. Finally, there is a combination of the Soviet fear of outside threat and the Soviet and Russian national aspiration to become a leading world power. In each of the three motivations there is a strong element of competition and conflict between the two economic systems and powers. These three forces clearly interact. Specifically, a case has been made that Marxism took root in Russian intellectual and revolutionary circles because it was seen as an inspirational and operational vehicle toward modernization (Gerschenkron 1971). As we shall see, the particular shape of socialist economic and political models, with many elements actually developed and shaped in Russia, conforms to its economic, political, and national aspirations and reflects the haste syndrome. According to Gerschenkron, the tension that builds up in follower countries is translated into more radical institutional arrangements and more drastic means than those utilized in countries that started MEG earlier. While early starters could leave growth initiatives in the hands of private entrepreneurs, late starters needed strong government intervention and direction (Gerschenkron 1971).

Haste, impatience, and radical action translate into a high time preference, a high discount rate for future benefits for the sake of short-term achievements. This observation is, however, the diametrical opposite of another image of the Soviet economy, an image usually associated with a high rate of investment, distant horizons, low time preferences, and low discount rates of future benefits. This contradiction can be resolved by observing that the objective function of the

Soviet leadership, the maximand for growth, differs from what is usually assumed in MEG models. High investment rates represent low time preferences when the goal is to maximize consumption and the welfare of the population in the long run. The Soviets first learned of a model of this kind in Marx "expanded reproduction" and developed their own versions early on in the industrialization debate and the preparations of the first Five Year Plan (FYP) in the 1920s. Evsey Domar (1957) describes a model prepared by Feldman in 1928; see also Erlich (1960). The early FYPs included both extraordinarily high rates of investment *and* high rates of consumption growth, the latter being more of a sop to public expectations than a realistic goal. Since the early FYPs, the imposed sacrifices in consumption have been consistently justified by the promise of abundance in the future and have been viewed as an example of a prudent and farsighted strategy to which many other countries were not equal. It has been felt that if it takes "stronger" measures to restrain the impatient consumption-hungry population, this should be understood and tolerated.

In 60 years, consumption levels, though substantially higher, have not become a high priority goal, and the share of consumption in total production is still relatively low. Thus some other, competing, shorter-term goals were placed higher up in the objective function of the system. Much earlier the Soviet leadership satisfied its goal of becoming a world power, militarily and politically, and of projecting this power far beyond its borders. Internally, the leadership secured its power and hold over the country so as to become one of the most stable regimes on earth. Revealed preference demonstrates that the above "composite good" was a goal in itself. If so, the growth strategy becomes much more

consistent, achievements were secured relatively early, the horizons are much nearer, and the instruments used more rational. The need to concentrate on defense and heavy industry during the 1930s was justified at the time, and obviously later, by the vital need to prepare for a German invasion. The above citation from Stalin and other pronouncements are evidence of Stalin's foresight. That threat, and later exogenous pressures on the Soviet Union to build up its military strength also partly determine the Soviets' chosen goals.

An extreme view is that the maximand is internal and external power building, and that its translation into economic terms is the maximization of the growth rate of heavy industry and defense production capacity. The final use of much of the product of heavy industry, as well as its own expansion, consists of investment goods; therefore high rates of investment become part of the goal rather than just the means to achieve it. Consumption, on this line, becomes a constraint, an intermediate cost of production to be economized. It should be kept at the minimum level feasible to assure internal stability, and at some level of acceptable work incentives (see Wolf's comments in Hildebrandt 1985a, pp. 141-48). These last two minima were termed by Berliner (1983a, p. 43) "the political and incentive thresholds of minimum consumption."

This extreme view need not be fully accepted, and is probably not entirely true. First, it is claimed that consumption or welfare belongs in the maximand, at least as part of the Soviet effort to project the superior nature of the socialist system, and help it win new adherents. Second, it is difficult to explain the drastic changes in consumption trends following Stalin's death on the basis of the above. Also, since that period there has been a significant shift from (mostly) repression to a more mixed use of "carrot

and stick," of repression combined with rising living standards, to stimulate effort. Finally, the repeated official pronouncements on raising the population's welfare as an independent goal cannot be discarded as mere propaganda. The best judgment may be that the welfare of the population takes an intermediate position, being both a constraint and a weak competitor in a crowded objective function.<sup>39</sup>

Whether the extreme or more moderate view on the objective function is accepted, all the comparisons of the previous section are off the mark from the Soviet point of view. It is not GNP or consumption or welfare per capita that should be compared but levels and rates of growth of total GNP *less* consumption. And if consumption is taken as an input and the stock of capital as part of the maximand, total factor productivity should be measured as total investment *plus* defense per unit of consumption and other inputs. No calculations are needed to show that Soviet achievements, at least until recently, are far more impressive if measured in this way. They would be even more so if expenditures on human capital, most education, and health care services were reclassified as investment.

When investment growth and power building become goals, the apparent contradiction about time preferences also clears itself up. Such goals are fully consistent with haste, high rates of time preference, and short horizons. One manifestation of high rates of time preference is the readiness to borrow at relatively high rates of interest. With very limited opportunities to borrow abroad, "borrowing" was mostly from the future, in

<sup>39</sup> This is not far from Berliner's formulation: "But if we are to capture faithfully the aims of the Soviet elite then we must accord first place to military defense, and derivatively to heavy industry, as the aim of economic development. This assumption does not compel us to deny that in some ultimate sense material incentives have their use" (1983a, p. 140).

two major forms: first, heavy commitment of resources to present growth at the cost of exceptionally high losses of such resources in the future. This form can be looked on as *high depletion rates*, though, as is made clear later, the term is extended beyond its ordinary use. The second form is the postponement of investments with lower yields, mostly in infrastructure, causing much higher current operating costs. The eventual need in the future to make up for postponed investments can be considered repayment of principal on the loans, and the higher operating costs, and excess "depletion" costs as interest payments. Both restrict the potential of future growth. Many specific examples are mentioned in the following pages.

Trading future growth for present growth may or may not be profitable, depending on the relation between the "interest" actually paid and the rate of time preference. Whatever the case, such a policy of haste becomes an additional factor to those usually mentioned in the literature explaining the recent sharp decline in growth rates, or a factor underlying some of the usual explanations.

The following discussion on the main elements of the system and its growth strategy pays special attention to elements of high time preference and haste.

### B. The System and Its Operation<sup>40</sup>

The overriding feature of the Soviet economic system is the combination of state ownership of most means of production and of the central planning of production and distribution. Since 1928, the Five Year Plan has been the main instru-

ment of strategic development, and the annual plan its short-term operational translation. Ideally, in such a centralized system the essence of Soviet socialism aspires to have full and sole control over the entire economy; it should be able to define clear targets and to focus on their implementation. In principle, less time should be lost on deliberations and decision making, less must be spent on gaining political and popular consent, and less wasted on secondary missions. In order to assure that directives are obeyed and that the population accepts the decisions on the allocation of resources, a political dictatorship ("of the proletariat") is established, with strong ideological and disciplinary authority and apparati to complement the command economy. The advantages of this system are obvious considering its goals. The main disadvantages many Western observers believe, are that command replaces initiative and entrepreneurship, discipline replaces motivation, and a rigid bureaucratic organization replaces the more flexible market. In many cases the decision-making process gets bogged down in a labyrinth of commissions.

Every shortcoming usually attributed to a bureaucratic organization is found here—and in the Soviet Union the bureaucracy encompasses the entire production sector. If the decisions are right and the structure of incentives reasonable, this kind of system can move ahead rapidly. But mistakes, when made, are also huge and more difficult to correct. The system is at its best immediately after a course is set; it is much weaker later on, when changes in course are required.

The three major elements of the centrally planned system are as follows: (a) production plans are very ambitious—the jargon uses the term *taut*; (b) the main success indicator and the basis for the incentive and reward system are the fulfillment of the annual plan's output tar-

<sup>40</sup> The literature describing the Soviet system is very extensive. Among many let us mention Herbert S. Levine 1959; John Montias 1959; Bergson 1964; Nove 1977, 1980, 1983, part 2; Michael Ellman 1971; János Kornai 1980; Paul G. Hare 1982; Bortolier 1987, 1978. J. W. 1969

gets; and (c) priorities are set as to which targets to aim at first, when difficulties arise. The most important time horizon for all the above is one year, a short time horizon that should be included as the fourth major element of the system. One year is a reasonable length of time for routine production plans, but is much too short for any important change (organizational or technological) involving disruption of routine performance, especially if the targets for routine production are exacting.

The plans are taut first because of the need to move ahead rapidly. The pressure of the political leaders on planners has been constant since the days of the first FYP. Tautness also aims at stimulating effort and extracting better results at all levels of the command hierarchy and is an important instrument of control and discipline. Because plans encompass the entire economy, *priorities* must be established to fulfill the plans of important sectors first. In this way the low priority sectors become substitutes for the absent reserves or slack in the plan. The *incentive* system must primarily reward the meeting of output targets because they are usually inputs in plans of other enterprises—the most critical links of the plan. Indirect signaling, using prices or profits, can rarely be used as substitutes, chiefly because prices are seldom scarcity prices; thus profits do not mean much. Finally, it is difficult to extend the basic annual planning period, because this would reduce control, especially in production and supply. All the elements combined create a permanent seller's-market environment, an economy of constant shortage, where most efforts are directed at receiving inputs and very little to selling (Kornai 1980, 1986). The salesman and the market expert of a market economy are replaced by the *tolkach*, the "expediter," whose (officially nonexistent) job is to see that supplies arrive on time. Shortages and uncertainty of

supply encourage "intraenterprise autarky" (Vladimir Kontorovich 1985a) as a substitute. Enterprises hoard inputs and establish auxiliary departments to produce spare parts, and in extreme cases even produce food for their workers.

Emphasis on fulfillment of output targets comes at the expense of most other efficiency criteria and leads to a phenomenon termed by Kornai the "soft budget constraint" (1980, 1986). In order to assure fulfillment, plants are ultimately allowed to use more inputs and labor and to disregard costs. Almost by definition, enterprises cannot fail and can count on being bailed out by the authorities when in trouble. It is easy to see that the soft budget constraint is a major source of inefficiency and also severely aggravates the conditions of shortage.

Another feature and consequence of the system of central planning is the strong bias toward short-term goals, to the detriment of long-term results and gains. In general, all inputs at the disposal of the management which, under normal conditions, would be employed in tasks relevant to longer horizons, are diverted to short-horizon tasks. The main consequence is very slow and inefficient innovation and diffusion, a matter we return to below. But this bias affects all changes in the production routine, from simple matters such as changing the supplier of inputs to changing the product mix, stopping production for major repairs, or maintaining a decent system of quality control. Short-term considerations are very costly, such as when equipment is not properly maintained; when oil is pumped out too fast, so that penetrating water damages next year's pumping potential (Goldman 1980, pp. 173–78); when summer fallow areas are sown beyond optimal levels to acquire small short-term gains in grain output (D. Gale Johnson 1983, pp. 133–34); and similar phenomena in investment allocation,

which are discussed later. All the above show a strong tendency to borrow from future production potential.

Finally there is the issue of the trade-off between efficiency and equality under socialism.<sup>41</sup> In principle, remuneration for work in the Soviet Union is according to work performed, which leaves room for substantial wage differentials. Wide differentials indeed existed under Stalin and up to the late 1950s, but they have been narrowed down substantially since then, mainly because of the dramatic expansion of the educational system. Add to this the almost complete elimination of nonlabor incomes, and one would expect to find an income distribution that is substantially more equal than in market economies. Bergson, in a survey in his journal (1984), demonstrated that the distribution of wages is not substantially more equal than in a number of market economies and that incomes are distributed only slightly more equally by similar comparisons. To the extent that equality hinders efficiency in the Soviet Union, it may be the result either of the inefficient use of wage differentials or of the denial of the opportunity to accumulate private wealth and to use it productively. The first problem, if it exists, can in principle be attended to. The second is at the heart of the socialist system and, so far, the state is still in search of alternative incentives or institutional structures that can efficiently replace the highly remunerated entrepreneur or manager of the market economy.

### 2. Elements of Growth Strategy

The economic system described above can be seen as one complex strategic decision on the Soviet course of modernization. The other strategic decisions are allocative decisions to which we now

turn. Given the goal of maximum growth of the heavy-industry sector and the desire to economize on the growth of consumption, the decision to bypass agriculture, is only natural, at least during the early phases. Early self-development of raw materials and of heavy industrial bases is also connected with one version of going it alone, that is, with autarky. Finally, there is the vector of strategic and policy decisions that come under the umbrella of extensive growth.

*Bypassing Agriculture and Collectivization.* Leaving the modernization of agriculture for later stages, unlike the "organic" pattern of leading countries, is a classical example of a Gershenkronian act of impatience by a follower. It was tried before by Witte during the earlier Russian industrialization drive. Agriculture was expected to pay heavy taxes and to export grain to finance an ambitious industrialization drive, which was only moderately successful. Agriculture went through a series of famines, and the outcome was crisis and revolution (1905). Stalin's decision to collectivize agriculture in 1928 (Russia's third revolution) was aimed at least partly at the same goal: first to assume tight control and then to press for rapid industrialization. To this day, the literature debate on the motivations and the outcome of that move is an important part of the bigger debate on "was Stalin really necessary?" (Nove 1964, 1969, 1971; Millar 1970, 1974, 1977, 1981; Millar and Corinne A. Guntzel 1970; Holland Hunter 1983). Views range from "maybe necessary but very costly" (Nove), and motivated partly on political grounds, to "Stalin's major economic mistake" (Millar 1981). Without going into details it is clear that the economic payoff fell far short of expectations in the 1930s and that the Soviet Union is still paying dearly for the decision to collectivize and for the way the decision was implemented. Everyone agrees that one of the main economic motivations

<sup>41</sup> The discussion follows Bergson's survey on this issue (1984).

for collectivization was to "collect," but there was also the belief, based on Marxist learning, that by transforming agriculture into industry-like large-scale mechanized production, productivity would go up.<sup>42</sup> Early plans called for a large share of agriculture to take the form of state farms, not collectives, but the heavy losses of livestock and grave inefficiencies in state-farm operation caused heavier reliance on collective farms, *Kolkhozi*, where losses and risks are borne by the farmers and not by the state procurement agencies.

The hopes for low-cost productivity gains in agriculture have not materialized to this day; indeed, the sector has been transformed from a net provider of resources into a net absorber of government funds. Since the mid-1950s, when consumption moved up somewhat in the objective function, agriculture went through a series of reforms in organization and in the structure and levels of incentives. Prices paid to farmers were raised; incomes were secured; and the supply of machinery, fertilizers, and other industrial inputs increased dramatically. The share of total investment to agriculture rose from 10 percent in 1950 to about 30 percent since the early 1970s. In 1980 the state subsidized agriculture with 37 billion rubles, about one-third of the value of its production (Trembl 1982, p. 171). More recently they grew to over 50 billion rubles (Colton 1986, p. 153). Subsidies support both input and output prices. Yet despite considerable improvements in performance, Soviet agriculture still lags badly in productivity and is unable to meet expectations of either the leadership or the population.

The initial organization of collectivized agriculture created a small private sector

consisting of a private plot allocated to every farmer and to others as well, mainly for production of food for their own needs, but also for sale in private markets to the urban population. It turned out that these small plots became a major supplier of food not only for the rural but also for the urban sector. The private plot was crucial to the Soviet Union in earlier years and is quite important even today as a major supplier of fruit, vegetables, and dairy products and thus of work incentives to the entire population. Its presence is, however, a constant reminder of the low level of efficiency of socialized agriculture. Although these plots account for only 3-4 percent of total land under cultivation, (animal fodder is grown largely on public land) they yield about a quarter of the entire Soviet food production (Ann Lane 1982, pp. 25-26; Karl-Eugene Wadekin 1973).

Three groups of factors are responsible for the poor performance of Soviet agriculture: the collective system itself as manifested mainly by the curtailment of the direct link between the farmer and his produce; the particular inherent difficulties in managing agriculture by central planning; and the long legacy of neglect, low priority, poor quality machinery and inputs, and poor transport and storage and supply systems.<sup>43</sup> All three clearly interact and there is no simple way to assign responsibility. It must, however, be clear that collectivization and central planning were imposed on agriculture for quick results. The immediate benefits gained took a long-term toll, which must be paid now, with high interest.

*Autarky.* Initial autarky and prolonged autarkic elements were discussed

<sup>42</sup> Collectivization was, of course, also motivated by the fear of potential resistance to the regime, and by the desire to establish control over and discipline throughout the hostile countryside.

<sup>43</sup> Recent summaries on the operation and performance of Soviet agriculture are by Roy D. Laird et al. 1977; Johnson 1982b, 1983; Douglas B. Diamond, Lee W. Bettis, and Robert E. Ramsson 1983. See also Robert C. Stuart 1972; Lazar Volin 1970. On private plots see Wadekin 1973.

in detail above. Let us point out here that the initial decision to go it alone fits perfectly into the formulation of the objective function and the time horizons. There is also a Marxist bias here. Even if faster growth could be achieved by developing agriculture first for trade purposes it would not have fulfilled the objectives as fast as desired. True, heavy industry could not be developed solely on the bias of previous Russian technological achievements, hence the one-time rush to collect a basket of up-to-date modern Western technology in 1929–32, on the basis of which self-growth proceeded. As shown above, autarky in the sense of very low trade proportions no longer exists—nor has it for some time. Even the goal of self-sufficiency in essential needs was relaxed with respect to agricultural products. The most important remaining element of autarky under the present Soviet practice is the high degree of isolation of the economy from world markets. Restrictions on most kinds of contact and the very limited connection between internal prices and world prices deny the Soviet economy the beneficial efficiency impact of such relations.<sup>44</sup>

*The Extensive Model: Mobilization.* One of the cornerstones of the Soviet growth strategy is the mobilization of a maximum number of inputs to the growth effort. This is the input side of the extensive growth model. Most of the factual evidence and some of the policies

of this drive were described in a previous section, and we concentrate here on a more general discussion of its sources and implications.

Mobilization of inputs first serves the major goal of rapid growth and catching up. It fits in very well with the nature of the system and with the regime of growth via pressure. It is also a rational and convenient source of growth at early stages, when labor participation rates are very low and growth leverage through a rise in the initial small capital stock is very powerful. Mobilization of inputs is also consistent with the Soviet objective function, which gives the standard of living and general welfare of the population a lower priority level. Investment levels are higher at the expense of consumption and there are heavy pressures to work harder and to use one's leisure to produce services for oneself.

Some aspects of mobilization are also consistent with socialist ideology and Marxist doctrine. The Marxist labor theory of value and the elimination of most nonwage sources of household income created economic and political motivations to join the labor force. The economic incentives affect household behavior directly; they are reinforced by laws requiring all able-bodied men to work and by educational and indoctrination campaigns. These, together with the doctrines of equality between the sexes and of the economic independence of women, also contributed (again with the help of economic incentives) to the rapid rise in the participation of women in the labor force. Similarly, the high rates of capital investment, especially in producer goods, are an integral part of Marxist growth theory. Marxist doctrine also influences the pattern of investment, as we shall see below.

The input mobilization side of the extensive model is necessarily temporary; the relative increments of inputs must

<sup>44</sup> With the dramatic rise in trade volume some influence of world prices on domestic prices do emerge, especially when world prices changes are as extreme as in the case of energy prices in the 1970s. It is indicative that many price changes in the Soviet Union take the form of changing retail prices without changing the price paid to producers. But there were also some price changes of machinery and equipment in spheres associated with imports and/or exports. In most cases price adjustments of this sort are partial and occur with a considerable time lag. See Trembl 1980, pp. 191–98; Trembl and Kostinaky 1982.

decline over time and hence, too, their contribution to growth. If a strong element of haste is also introduced, exhaustion will be further hastened. The decline in the rate of growth of labor comes naturally after reserves are utilized and the rate of rise of labor inputs converge with a declining growth rate of the population. While the decline in the population is partly a natural corollary of economic modernization and partly a direct outcome of World War II, it was very likely accelerated by pressure, especially on women and mothers, to join the labor force, by other pressures on free time, and by the low consumption, especially of housing and household amenities.

At present, it is clear that the labor potential for extensive growth is exhausted. Given the heavy value placed on growth, and the relatively limited value awarded to consumption, population growth must be welcomed by the system's directors. Therefore some policies believed to be responsible for declining birth rates have been reversed during the past decade (Gail Lapidus 1978, 1982; Feshbach 1983; Feshbach and Rapawy 1976; Jeffrey W. Hahn 1982; McAuley 1981; Paul R. Gregory 1982, 1983; Berliner 1983b; Baldwin 1979; Rapawy 1976; Goodman and Schleifer 1982).

The fact that the contribution of each unit of *capital* to growth must decline in the extensive model is the essence of this model. Extensive growth may be defined as a growth path along which capital grows at a (much) faster rate than output. Given the relatively slow growth of labor, this path will be followed whenever overall productivity growth is lagging. A necessary condition for rapid growth is that the share of investment in GNP grow monotonically, for it takes a larger share of a slower-growing GNP to keep the growth rate of a faster-growing capital stock constant. Only productivity growth at a rate that equalizes the growth rates

of output and capital can avert this outcome, and its absence is what makes Soviet growth extensive. Bergson, who pointed out this application of growth theory to the Soviet record, also demonstrated that in order to sustain a 2.5–3 percent contribution of capital to output growth, assuming low productivity growth, capital has to continue to grow at 8–9 percent. This, however, would push the share of investment in GNP not only far beyond the present 30 percent level but also to the point where noninvestment uses would begin to decline in absolute terms (Bergson 1973, 1975). In order to avoid this, investment shares must stop growing and the growth rate of investment must decline to the rate of GNP growth. This, in turn, reduces the growth rate of capital, which will eventually also converge to the rate of growth of output, leading to a decline in capital's contribution to growth. Such developments have indeed been taking place over the past decade, and the contribution of capital to growth had declined to only one percentage point (Tables 1 and 3). The leadership's concern over this development is evidenced in the apparent reversal of the declining trend of investment growth in the current (12th) FYP (Hewett 1985, pp. 300–03).

Haste to reach the upper limit of the investment share is in itself a no-cost loan from the future, provided no loss is incurred by speed. Even so, later growth rates of output are bound to decline. Costs are involved if the speed at which the capital stock is growing adversely affects both its quality and that of the embodied technology, the lead time of construction, and the efficiency of installation and of eventual production. The literature abounds with examples of inefficiencies in all these aspects; there is no question that a slower pace would have been much more efficient and that

a reserve of potential increase in the investment share could have been built up (Cohn 1970, 1976a, 1976b, 1979, 1982; Boris Z. Rumer 1982, 1984a, 1984b, 1984c).

Finally, it should be pointed out that with near zero growth of labor, the extensive growth turns into growth led solely by capital. Such an extreme imbalance between capital and labor adds to the difficulties in the introduction of new capital, and further reduces capital and overall efficiency. We shall also come back to this aspect.

*Specific Investment Policies.* The classical Soviet investment strategy first follows the objective function in directing the lion's share of investment to producer-goods industries. The concentration of investment in such industries ("Sector I" in Marxist terminology) is the key to rapid growth in Marxist and Soviet growth models. A second Marxist and Soviet distinction is between "productive" and "nonproductive" investments. The latter include all investments in services such as housing, urban infrastructure, and consumer services, as well as in public administration, banking, and other business services. A third preference of Soviet investors is for investment in core production processes as against auxiliary functions, which are left to simpler, labor-intensive technologies. One motivation for such a policy is to allow the concentration of scarce capital in key processes that absorb the most advanced Western technology and that are usually highly capital intensive. In this way, the most important technologies can be incorporated, while the overall capital/labor ratio remains low and reflects Soviet factor availabilities. This aspect is developed in detail by David Granick (1967, Ch. 6). Another aspect of this preference is to start production early, putting off auxiliary functions for later, also a manifestation of the haste strategy. Under

such a policy, investments in transportation and communication networks, in storage and shipping facilities, and in urban infrastructure are all postponed or minimized in order to concentrate on "real" production. In many cases the investment requirements for infrastructure or transportation are very large and the payoffs indirect and slow, so capital productivity without them may be higher in the short run.

One example of such preferences is the development of the raw material bases in Siberia with very limited investment in infrastructure and in industries of both consumer, "nonproductive," or productive types (Rumer 1984a; Cohn 1976b)—a clear example of haste. Another is the constant underinvestment in the transportation network (H. Hunter and Deborah A. Kaple 1982).

Another important manifestation of such investment policies is the comparatively lower level of urbanization, at least until very recently. On the one hand, directing investment to manufacturing raised the capital/labor ratios beyond "normal" levels and left those in agriculture abnormally low. Such a shift in the capital/labor ratios was also desired because it helped reduce the required rural-to-urban migration and hence the urban infrastructure needed. Economizing on urbanization was also achieved by the demand that every able-bodied migrant participate in the labor force, by a lower demand for labor for urban services, and by limitations on construction of infrastructure for services. The amount of urban infrastructure per capita was also minimized. A final advantage of the policy of economizing on migration to cities is that it helps limit consumption and consumption expectations. Rural populations do not need as many services as do city dwellers and their expectations for improved consumption develop much more slowly. In pursuing such a policy

the Soviet authorities made it difficult for people to move freely to the cities. Until recently collective farm members did not have personal passports and were not allowed to leave their farms without permission. Moreover, permission to reside in major cities still had to be obtained (see Ofer 1976, 1977, 1980a; on East Europe see Eva Ehrlich 1973 and G. Konrad and I. Szelenzyi 1974).

Another distinctive feature of Soviet investment policy is the overconcentration of investment in new plants compared with replacing equipment in existing enterprises. Such a pattern, very natural in the early stages of industrialization, has prevailed in the Soviet Union to the present (Cohn 1979, 1982; Hanson 1981, 1982b). The main reasons are the relative ease of planning and directing new plants from the center compared with planning and enforcing replacement investment in existing enterprises. One corollary, but also a possible consequence of the policy, is that service lives of machinery and equipment in the Soviet Union are extremely long (Cohn 1979).<sup>45</sup> Pressures to meet exacting output targets also contribute to the reluctance on the part of managers to introduce new and retire old equipment. Such old equipment needs much maintenance and repair, another form of "interest" payments due to haste. A second consequence of the concentration of investment in new plants, when combined with the general pressure on current production, is the increasing stock of incomplete projects. Such stocks hold up production and delay the introduction of new technologies. Finally, investment in new plants raises the proportion of construction in total investment, thus again reducing its technological content (Cohn

1979, 1982; John A. Martens and John P. Young 1979; Hanson 1981, Ch. 4). A of late, Soviet planners have tried to tackle these problems by cutting down on new projects and by redirecting investment to the replacement of equipment in existing enterprises (Kontorovich 1985b; Grossman 1953, 1955).

While resisting the introduction of replacement equipment, plant managers overdemand investment funds, also as part of their effort to meet exacting production plans. Accumulated excess capacity can help meet production norms under conditions of frequent shortages due to equipment failures and supply interruptions, and can be used to produce unobtainable spare parts for oneself, albeit at high cost. Similar factors, as well as rigid pricing policies and low-quality production, lead to high investment in inventories. The long tradition of no charge or low charge for capital funds also contribute to excess demand. The accumulated capital "reserves," which are quite significant despite the strong rationing efforts of the planning authorities, also contribute to the low level of capital productivity.

Soviet investment policies, in summary, reflect first and foremost the allocation decisions embodied in the growth strategy, including many elements of haste and high time preference. They may also reflect the ability of a center to internalize and take into account external effects of urbanization. Finally, they respond to particular systemic and organizational difficulties, as observed in the bias in favor of new plants and against replacement investment.

Our review of the Soviet growth record and our discussion of the nature of the Soviet system (Sections III-V) have pointed out the significant differences between the Stalinist and the post-Stalinist eras. In many respects, however, the en-

<sup>45</sup> Until after Stalin's death obsolescence was not recognized as a legitimate reason to retire equipment.

a period can be seen as belonging to the same basic system and growth strategy. By way of summary let us point out the most prominent differences and similarities.

The most striking difference is, of course, the substitution in the post-Stalinist era of some coercive and punitive measures with more generous increases in consumption levels. From the population's point of view, this was indeed a revolutionary change, and not only in the economic sense. In terms of the objective action discussed above, the weight allocated to consumption was clearly increased. In the early years of the post-Stalin era consumption could grow out of resources that became available through postwar reconstruction, from the decline in defense spending, and from efficiency gains created by the relief from oppression. The change in investment patterns, however, was very small or nonexistent. Indeed, the share of investment in GNP continued to climb until the early 1960s, when it reached a plateau of 28-29 percent in gross fixed investment (Table 3). The level of investment could not be allowed to grow any further if the aspired for increase in consumption and defense was to be achieved.

In the post-Stalin period, although the attention was paid to agriculture and international trade, there was no change from the extensive to an intensive model, nor were there any significant changes in the basic system and its modes of operation.<sup>46</sup>

## VI. *R and D and Technological Change*

The obverse side of the coin of the extensive model of growth is the rela-

tively (and eventually absolutely) small contribution of the rise in overall productivity to Soviet growth. Research and development (R and D) and the introduction and diffusion of new technologies into the production system are among the major potential contributors to advances in productivity in general. In the Soviet Union, however, they are among the main victims of the central planning system and of the policy of haste. Considering the central role of productivity growth and technological change in the growth process of most other countries (Kuznets 1966, Chs. 1 and 10), Soviet technological performance must be carefully examined and evaluated.<sup>47</sup>

The slow pace of technological change was certainly unintentional. On the contrary, technological change as a main aspect of economic modernization was always emphasized by Soviet leaders; allocation of inputs to R and D activities was always relatively generous; and there seem to be good a priori reasons to assume that a centrally planned system should favor rapid technological advance. The results must, therefore, be attributed largely to unanticipated negative consequences of policies in other spheres and to the economic system. Bruce Parrott (1983, Ch. 2) suggests that the difficulties in R and D and technological change are due partly to the leadership's underestimation of the requirements for success.

Technological change under a centrally planned system has a number of advantages over a pure market system, where

<sup>47</sup>The literature on this topic is abundant. The major recent works are Berliner 1976; Ronald Amann, Julian Cooper, and R. W. Davies 1977; and Amann and Cooper 1982; the three-volume work by Antony C. Sutton 1968, 1971, 1973; Hanson 1981; Parrott 1983; Bornstein 1985; and many earlier works. These books include surveys of earlier works and many references. The following is based mostly on Berliner 1976; Amann and Cooper 1982, Ch. 1; and on Hanson 1981, Ch. 4, which is a concise but very good summary of the main issues.

<sup>46</sup>On the question of how distinct these two periods are from one another see Bergson 1986, pp.

externalities and market failures reduce its efficiency. Lange (1938), among others, applauded the economic advantages of socialism in large degree on the basis of these advantages. In a centrally planned system, the center in principle, can formulate a national scientific technological development program based on all available information and in accordance with national priorities. It can then build the organizational structure for its execution; secure the needed resources, manpower, and funds; and monitor implementation throughout the entire innovation cycle, from basic research through diffusion. All potential benefits from innovation can be readily internalized and no information or patent-protection barriers would prevent rapid introduction and diffusion. Indeed, many market or mixed Western economies are taking similar measures of government intervention to avert market failure, albeit very selectively.

Of the above list of a priori or assumed advantages, a number were actually realized: First, a vast institutional infrastructure for science, R and D, and diffusion of innovation was built, usually generously and consistently funded and staffed. Today the Soviet Union probably outspends the U.S. (as a fraction of GNP) and employs a larger work force of technicians and scientists than does the U.S. on R and D (Bergson 1983b, pp. 53–56; Louvan E. Nolting and Murray Feshbach 1979, 1981; Nimitz 1974; Eugene Zaleski et al. 1969).

A second realized advantage is what Berliner terms *mission-oriented projects*, which are major investments decided on and executed by the center on a top-priority basis. This occurs mainly in new plants, which are thus shielded from the disruption of ordinary production activity and intervention by lower-level authorities (see below) (Berliner 1976, pp. 504–18). Many of the Soviet technological

achievements, notoriously in the military and space sectors are outcomes of such mission-oriented projects.<sup>48</sup> However, only about a quarter of all projects involving major new technologies are directed from the center proper, however, the rest are left in the hands of ministries and lower-echelon authorities (Hanson 1981, Ch. 4).

Finally, it is also generally agreed that Soviet science as such works at a high level in a number of fields (Loren R. Graham 1984, pp. 124–27); however, the danger in a dictatorship of Stalin's type is that science comes to a dead end when dictators decide on the "right" direction of scientific advance. In the Soviet case this happened on a large scale at least twice, once when Stalin forbade the use of mathematical methods in planning and economics (Wassily Leontief 1960), and again when Stalin and Khrushchev drove biology into an impasse (Zhores Medvedev 1969). These are just two notorious examples of a general tendency.

Despite the advantages, many R and D efforts fail to achieve the desired result because they are frustrated by a multitude of weaknesses and drawbacks. The combination of bureaucratic planning and command, of a flawed reward system, and of pressure for short-term production outcomes, helps create an inhospitable environment at all stages of the innovation cycle.

The discussions of innovation in the Soviet Union concentrate on three areas: the R and D sector itself, the separation between the R and D and the production sectors, and the problems of introducing and diffusing innovations within the production sector.

<sup>48</sup> Hanson (1981, p. 67) is right in proposing "that the design of the Soviet system was aimed, in part, precisely at carrying through large investment projects, and at facilitating a process of technological change in which the construction of new plants played a dominant role."

## The R and D Sector

Traditionally, basic and applied research, development, and even much prototype production and testing in the Soviet Union are confined to special research institutes belonging either to the various academies of science or to production ministries. Each has its own projects, and reports upward within its own institutional hierarchy. Comparing the main characteristics and needs of R and D everywhere and the major attributes of the Soviet production system discussed above, one observes a number of conflicting features. R and D needs reserves and slack; but the system is very tight and operates on the basis of shortages. R and D requires flexible supply lines, free-form plans, and open time horizons and does not always have clear results; but the supply system is rigid and plans are routine, bound by time, and expected to be strictly met. R and D requires organic and flexible modes of organization and free multidimensional (especially lateral) interaction and connections, but it faces rigidly structured, hierarchically directed organizations. R and D needs autonomy as one condition for initiative and creativity; but it is restricted by discipline, regimentation, and conservatism. R and D needs challenge and competition; but it operates in a seller's market where low prices are not always a virtue. Many R and D projects are by nature small-scale; but the Soviet system is geared to deal with large-scale routine production. R and D needs a free flow of information; but the system is both highly departmentalized and shrouded in a dense screen of secrecy that extends far beyond what is usually considered state security, to say nothing of interaction with the outside world. R and D needs to be rewarded by the end result of its efforts, not by the number of projects or papers com-

pleted; this, however, is very difficult to accomplish, and the Soviet reward system is indeed based on such less meaningful "production" assignments. In short, R and D works best with flexibility, autonomy, change, slack, free interaction in all directions, all of which are in extremely short supply and very costly under the Soviet system.<sup>40</sup>

### B. Interaction Between R and D and Production

According to the traditional organizational methods, Soviet R and D institutes have been separated almost completely from production enterprises. Whether they belong to the Academy of Sciences or to a production ministry, their formal connection with enterprises is through the ministerial hierarchy. This separation between R and D and production is considered by many observers, inside and outside the Soviet Union, to be a major obstacle to the introduction and diffusion of innovations (Bornstein 1985, p. 33). The difficulties created by this separation are easy to see: Research institutes follow their own goals and plans, which are detached from those of enterprise managers; they have only partial information on the client's needs; and there is no unified system of responsibility for an innovation from its inception to its introduction and use. Enterprise managers complain that many innovations are too expensive, that prescribed inputs are not available, and that introduction is not followed up by the R and D staff.

### C. Introduction and Diffusion of Innovations

While separation is a real handicap, it may well be considered less so when

<sup>40</sup>The literature offers innumerable examples on problems of the R and D sector and on difficulties resulting from short-term considerations, including, among others, Berliner 1976, Ch. 4; Hanson 1981, Chs. 3 and 4; Bornstein 1985, Ch. 2; Parrott 1983; Zaleski et al. 1980; Ofer 1980b.

This discussion reflects the literature's valuation of Soviet R and D activity in the civilian sector. In almost all cases, exception is made for military R and D, where, as most scholars agree, performance is far more successful and achievements are impressive.<sup>50</sup> It is of interest therefore, to explain the sources of the excess of military R and D in so far as they further explain or qualify the observations on the relationship between the Soviet system and its growth strategy and technological change. All students agree that Soviet military R and D consists of top-priority, mission-oriented projects and directed from the center. In addition to the priority allocation of highest-quality manpower, funds, and facilities; smooth supply lines; more lucrative incentives; and more flexible organizational modes, military R and D is also isolated from the aggravations, barriers, and problems of ordinary bureaucratic planning. Priority treatment is by definition selective, and the benefits it awards translate into costs to the excluded sectors, in this case especially civilian R and D. One aspect of the above-mentioned isolation, combined with the heavy secrecy screen, is that the military allows almost no spin-off of innovations to the civilian sector. Recognizing its weakness, the military developed the capacity to self-supply, and aims all its requirements in-house. In the short- or medium-run this policy secures military needs at a heavy cost to the civilian sector. In the longer run, including the past 10-15 years, the military is bound to grow more dependent on the level and infrastructure of civilian R and D. The price of

impatience and haste is being paid now, with civilian R and D unable to support expanded military needs.

There is some disagreement in the literature on the extent to which military R and D is immune to most of the system's ills and about the true quality of Soviet-developed military technology, about the level of efficiency of military R and D when both inputs and the technological content of new weapon systems are appropriately measured, and finally, about the extent of real trade-offs between military and civilian R and D activity. But even here, the inability of the system to generate new technology across a wide spectrum of military and civilian projects at the same time is underscored by most scholars.<sup>51</sup>

There are two rational economic responses to comparative disadvantage in technological change, or to the undue expense of R and D: one is to import technology, the other is to economize on the use of R and D by substitution with other inputs. Both courses of action have been followed in the Soviet Union.

Importing Western technology was a main tool of technological advance all along; only the method shifted in the early 1960s from "borrowing" and reverse engineering to commercial purchases of equipment, entire plants, and technological know-how, as described above. Sutton (1973, p. 370), who reviewed the Soviet technological advance in hundreds of technologies over 1917-65, found it was almost all due to importation, with only a very small Soviet indigenous contribution in a small section of all technologies. While imported technology clearly contributed to the Soviet economy, the success was less than expected or hoped for and very little indigenous capability was generated by it. This is testimony to the fact that not only

<sup>50</sup> This is even pointed out by Sutton (1973, p. 370), who probably takes the most critical view in the West of Soviet technological abilities. For a discussion of this issue see David Holloway 1977, 12, 1983; Berliner 1976; Becker 1986; Arthur J. Alexander 1978; Nimitz 1974; Parrott 1983; Ofer 1986.

<sup>51</sup> See references cited in the preceding footnote.

the R and D sector but also the production sector, with its problems of introduction and diffusion of innovation in existing and new plants, share responsibility (Hanson 1981, p. 53).

The discussion in this section has not made the distribution between technological changes of a leading country consisting mostly of major new innovations at the world frontiers, and technological changes of an essentially follower country that consist of borrowing, adapting, and improving such innovations. The Soviet Union clearly aims at joining the leaders, at least in some (e.g., military) fields; however, the discussion so far, including that on technological transfer, should have made it clear that the Soviet Union faces increasing difficulties even in sustaining its position as an effective follower.

The second response to the high cost of R and D is the conservative nature of research and development activity—military and civilian alike. Conservatism shows up in the marginal-improvement approach to innovation and in the maximum use of off-the-shelf parts and components. It was first introduced in the 1930s, when the decision was made to concentrate R and D effort on “replication, modification and scaling up of existing Western models” (Ronald Amann 1982, p. 19)<sup>52</sup> and was incorporated into the system as one of its conditioning elements, making it difficult to abandon later (Amann 1982, pp. 23–24).<sup>53</sup> Hanson clearly reflects the accepted view in stating that “Soviet systemic weaknesses in innovation extend quite widely and are by no means confined to innovation and

diffusion at existing enterprises” (Hanson 1981, p. 74).<sup>54</sup>

Hanson further concludes that “there appears to be something approaching Soviet conventional wisdom which, by implication, also holds that the USSR has major relative weaknesses in technological performance” (1981).

## VII. *Why Did Growth Rates Decline? Production Function Estimates*

The discussion of growth strategy and the economic system sheds light on the systemic sources of growth, on its structural patterns, and, among other things, on possible reasons for the secular decline in growth rates. Three major explanations for this decline emerge: First, extensive growth is by nature exhaustible as manifested in the unavoidable decline in the growth rates of inputs. Second, technological change and improved efficiency failed to replace input growth; in fact, the contribution of technology declined over the years, reflecting the increased difficulty of borrowing Western technologies cheaply. Finally, the de

<sup>52</sup> On the decisions on R and D policies in the 1930s see also Parrott 1983, Ch. 2.

<sup>53</sup> Conservatism sometimes helps create the false impression that R and D is more productive than it really is. The fact that lower R and D content is embodied in seemingly similar products is sometimes overlooked. See Alexander 1978 and Ofer 1980b.

<sup>54</sup> Sutton's conclusion, at the end of a three-volume study of the history of Soviet technological activity is that “the system cannot develop technically across a broad front without outside assistance; internal industrial capacity can be expanded only in those sectors suitable for scaling-up innovation and duplication of foreign techniques” (Sutton 1973, p. 419). A less extreme, but similar conclusion was reached by a group of researchers in Birmingham, after completing a large comparative study of Soviet technological capabilities (Amann, Cooper, and Davies 1977; Amann and Cooper 1982). Amann writes that the study confirms earlier Western accounts of the negative systemic impact on Soviet innovation processes “These systemic features appear to apply equally to all case studies in our sample with the exception of the military sector” (Amann, Cooper, and Davies 1977, p. 18). And a final conclusion, five years later formulated a “rough hypothesis that successful innovation appears to be associated with a high level of government support, preferably of a longstanding and stable kind, low cost, average or below average research intensity and low level of ‘complexity’ in the sense of interdisciplinarity of research fields or close dependence on other industries” (Amann, 1982, p. 7).

cline in growth was accelerated by the strategy of haste. Haste not only made the growth curve decline more steeply but has also been partly responsible for the difficulties encountered by the Soviet economy in shifting to an intensive path. Haste has contributed to the present low rates of growth mainly by accelerating the exhaustion of extensive growth and by accumulating numerous bottlenecks in the production system, creating backlogs in needed investments—all of which must be paid for now. Haste makes change difficult because it has a negative effect on R and D and because it limits the feasibility and prospects of economic reform.

The literature discusses a number of other factors that contribute to the downward trend. The first is the growing complexity of the economy. This argument maintains that planning from the center was reasonably simple in a more primitive economy, which produced a more limited number of products and had a clearer vision of how to translate goals and priorities into production plans. But as an economy becomes more advanced and complex the number of options and variations multiply, the amount of required information and coordination grows at a much faster rate than the economy itself, and it becomes more and more difficult to cope in spite of technological and theoretical advances in data management and planning. While in the early stages learning and improving the system may have been dominant, most students feel that at some point in recent decades, greater complexity turned the balance (Bergson 1983b; Levine 1982b).

Second is the persistent and increasing drag on growth caused by the large and rising size of defense spending. As we have seen, the share of defense spending in GNP has been increasing slowly since 1959 (Tables 1 and 3). Numerous studies have attempted to estimate the func-

tional relationship between growth (via investment) and defense, and between consumption and defense, but the trade-offs correspond fairly closely to the amount of resources engaged. None of the studies discovered either special windfalls coming from the transfer or particular obstacles that might limit the trade-off to less than one ruble for each ruble taken from defense. It seems to me, however, that the emerging one-to-one relationship in most studies is built into the models through assumptions.<sup>55</sup> Even the evidence gathered over the past decade, when the real rate of growth of defense was drastically cut—mostly through a near freeze on the growth of procurement—is far from conclusive (Kaufman 1985). It is, reasonable however, to assume that lower defense burdens and slower defense growth rates could (in the past) have brought, and may (in the future) bring, some small measure of relief to overall growth and consumption (Becker 1985; Kaufman 1985).

A third factor contributing to the decline of growth is the weakening of the material incentive system as a result of the inability to fulfill the production targets for consumer goods. Declining growth cuts first into consumption increments, a low-priority target, which in

<sup>55</sup> Thus Sovmod, the leading macro model of the Soviet economy, yields the finding that the transfer of 1 percent of the growth rate of defense (= 0.14 percent of GNP) to investment, at 12 percent annual return, can add about 0.018 percent to annual GNP growth. Because marginal capital/output ratios are rising (see below), this is not a very productive trade-off. Alternatively, Sovmod students as well as M. M. Hopkins and Michael Kennedy, Hildebrandt, and others studied the trade-off between defense and consumption and found that, at most, after a few years, the resources released from defense could be transferred, ruble per ruble, to consumption: approximately 0.33 percent growth in household consumption per each percent drop in defense spending (Daniel L. Bond and Herbert S. Levine 1982; Hopkins and Kennedy 1984; Hildebrandt 1982b; Becker 1982, 1986; Lars Calmfors and Jan Rylander 1976; and others; see references in Becker 1986).

turn has negative effects on work motivation and efforts, thus further reducing growth. If, to avert these effects, the wage bill is kept higher than the realized consumption bill, repressed inflation emerges to add another source of frustration. A "second economy" developing alongside the main, public sector takes another bite from the effectiveness of the public sector but must be tolerated because of its beneficial effect on work motivation. Heavy drinking is another refuge from dissatisfaction. In the Soviet context, where material incentives fail to meet their target, efforts can be redirected to disciplinary actions about which there have been some recent reports.<sup>56</sup>

The effects on Soviet growth rates of most of the factors mentioned so far were defined in qualitative terms and many will have to remain so until ways of quantification are developed. Nevertheless, some effort has been made to quantify the more elusive elements in the Soviet growth equation beyond the common division into growth of inputs and the "residual" of output per unit of input. The quantitative study of the residual proceeded along two lines: The first follows Denison, which peels away at the residual, layer by layer, and accounts for a long list of factors that were not included earlier as "inputs" (Edward F. Denison 1967, 1974, 1979). The second consists of alternative estimates of production functions. Denison's method was first used by Kaplan (1969), who was also the first to show that the decline in GNP growth was due not only to lower input growth but also to declining productivity. Denison's method was then used extensively, mainly by Cohn (1970, 1976a,

1976b) and Bergson (1973, 1983b). In a recent work, Bergson, concentrating on both GNP and the material production sectors only (GNP less most services), starts from a "basic" residual, after capital, annual labor hours, and land are taken into account against output. In order to isolate the part of the residual that most closely measures technological progress proper (TPP), Bergson (1983a, pp. 41-49) adjusts the basic residual to take out the following:<sup>57</sup>

- a. Rising quality and productivity of labor resulting from increased levels of education and decline in work hours.
- b. Depletion of natural resources and declining quality of farmland.
- c. Productivity gains from the movement of labor from farming to nonagricultural employment and from economies of scale.
- d. The effect of planning reforms and other organizational changes. Here Bergson speculates that the increased complexity of the system offsets any gains emerging from such reforms.
- e. The significant negative impact of bad weather over 1970-75.

A summary of the resulting calculations for the material sectors over 1950-75 is presented in the following table (rounded percentages of average annual growth; Bergson 1983a, p. 49):

Period	Basic Residual	Adjustments	TPP
1960-69	3.6	0.7	2.9
1960-70	1.8	0.8	1.0
1970-75	0.3	0.1	0.2

<sup>56</sup> On repressed inflation, the second economy, and alcoholism as disrupting efforts and motivation see Grossman 1982a, 1982b; Vladimir Kontorovich 1985b; Fyodor I. Kuznirsky 1984; Birman 1981; and many others. On causes for declining growth see also Levine 1982.

<sup>57</sup> Cohn also makes adjustments for changes in age and sex composition but they turn out to be small. He also divides capital into residential, nonresidential, and inventories (Cohn 1976b, pp. 53-54).

Calculations of TPP for 1975-85 would most likely produce similar results to those for 1970-75 even though the residual is eliminated altogether (see Table 1). Bergson collects further qualitative evidence in support of the result of the calculation that the technological performance of the Soviet Union is indeed inferior, especially for a country that still has considerable catching up to do.

The big challenge to this method of analysis and its conclusions came with an article by Martin Weitzman in 1972. He challenged the entire "trinity" concept consisting of Bergson's method and findings, the CD production function, fixed input shares, and declining residual, and presented estimates of a CES production function for Soviet industrial output. These, he claims, achieve a better fit to the data than the CD function and yield the following findings and conclusions.

First, the elasticity of substitution of capital to labor was estimated at about 0.4, rather than the assumed 1, and the residual, the indicator of technological change, was estimated at a constant rate of about 2 percent annually. Weitzman's conclusions were: "By this time [the late 1960s], a low elasticity of substitution seems to imply that capital accumulation has outstripped labor growth by a wide enough margin that the drag due to diminishing returns is significantly cutting into output growth" and "The present emphasis on diminishing returns is very different from the somewhat more usual factor productivity approach. Accordingly, the sharply diminished growth of factor productivity usually emerges as the main reason for the Soviet slowdown" (p. 685). Over ten years later, after many more production function estimates by Weitzman and others, the same conclusion is reasserted in even stronger terms: "If we are to believe this approach [the CD method], the growth of the residual

has declined rather dramatically from 5 to 6 percent [*sic*] in the early fifties to about 1 percent in the late seventies. Such a conclusion is a bit difficult to absorb in its entirety . . . [among other reasons because] far greater attention is paid to questions of economic efficiency in more recent years than in the past" and "An alternative historical explanation to the Soviet industrial slowdown is not to make the residual take all the blame, but to allow a low elasticity of substitution to share some of it" (1983, pp. 185-86). Before tackling the main issue, it should be pointed out that Weitzman's CES estimates offer an alternative interpretation to the end of the extensive model. It came about not only when the share of investment in GNP hit the ceiling, but also because the marginal product of capital declined, where capital is the only growing input.

The real disagreement is about what caused the slowdown and therefore about how to try to reverse it. One must first spell out the technical aspects of the two interpretations. We do so in a world where capital is growing much faster than labor, just as in the Soviet Union. When the elasticity of substitution is smaller than one, the share of capital declines with time (the same capital series multiplied by a declining rate of return), causing the rate of growth of combined inputs to decline as well, leaving a higher residual. Because the declining capital share is monotonic, it almost "replaces" the decline of the residual under a constant-shares assumption. In this way, the same data support both versions.<sup>58</sup> While a

<sup>58</sup> This conclusion must be qualified, as it is based on the unlikely assumption of Hicks neutrality of the technological change assumed in the CES estimates. A capital using bias in the technological change, as is most likely the case, would mitigate the pace of decline of the marginal productivity of capital and of its share, and as a result the residual may now decline also under the CES estimates. This criticism of conventional CES estimates made by Moses Abra-

number of papers over the last 15 years claim statistical superiority for the CES interpretation (Padma Desai 1976; Rosefelde and C. A. Knox Lovell 1977; Gomulka 1977; Toda 1979), I tend to agree with Weitzman's most recent statement on this matter: "... without further information we do not know how to decide on statistical grounds alone between the two alternatives" (1983, p. 187).<sup>59</sup>

More important than the debate over econometrics is the question, to what extent do the two interpretations tell two distinct, mutually exclusive stories about the basic reasons behind the observed phenomena. We would like to stress a point, occasionally made in the literature, that a declining marginal productivity of capital, as in the CES theory, can result as much from weaknesses in, and misdirection of R and D activities as from problems of investment policy. Similarly, a small and declining "residual" can stem both from unsuccessful R and D and from suboptimal investment policies. Previous discussion in this paper provided many

reasons for the productivity of capital to decline. But under conditions of labor shortage it is also definitely the responsibility of R and D to provide the right kind of labor-saving innovations that can make the absorption of new capital more efficient and avert its declining productivity. This point is stressed by Kontorovich (1985a), who claims that lack of labor-saving innovation in new capital is responsible for the continued creation of labor-intensive workplaces with no workers to man them (1985a; Josef C. Brada 1985, p. 126). It seems, therefore, that the two different production function interpretations provide little help in resolving the real issue.

Most recently, Weitzman (1983, p. 187) seems to agree, at least in part, with the above when he states that both suboptimal investment policy and unsuccessful R and D must share the blame for low growth. More important, he also says that whatever the diagnosis, the only way to reverse the trend of declining growth rates is by much heavier reliance on technological change. If Weitzman was willing to compromise, so was Bergson. In his latest contribution on this issue Bergson also included, in the variants of residual analysis to be considered, estimates with an underlying CES production function with elasticities of substitution of 0.5. With 12 and 6 percent return on capital he obtains the following results for the material sectors (annual average growth rates of the residual; Bergson 1983b, p. 38):<sup>60, 61</sup>

---

movitz and Paul A. David (1973) applies to many estimates and aims to show that technological change is embodied in the capital series in addition to its presence in the residual. This criticism may also be relevant, in principle, to the Soviet Union, except that the declining rates of growth do not allow too much capital using technical change *along with* a 2 percent growth of productivity. The relatively low R and D content of investment may limit the extent of capital using technical change. See, for example Kontorovich (1985a), the discussion in Section VI, and also below.

<sup>59</sup> There have also been extensive arguments on the types of data used, the modes of aggregation, and the plausibility of the results. One example is that it follows from Weitzman's CES estimates that the capital share in Soviet industry reached 80 percent in 1950 and declined to 27 percent by 1978 (Weitzman 1983, p. 187), or that the return to capital reached levels of 38-199 percent in 1950, but declined to 6 percent already in 1969 (Bergson 1979, pp. 117-20). It is reasonable that the rate of return of capital should fall under the circumstances, but not as sharply, and not to such an extremely low level. Surveys of this literature are presented by Bergson (1979) and Brada (1985). Challenges to Weitzman's 1972 paper were offered by Earl R. Brubaker (1972) and T. Krishna Kumar and Ephraim Asher (1974).

<sup>60</sup> While Weitzman could not justify a breakdown of the period into significant subperiods, Norman E. Cameron (1981) and Gomulka (1977) did find significant divisions, but in both cases the trend in productivity was not declining (Gomulka) or it was even rising (Cameron). Other similar results for the 1950s and 1960s were obtained by Rosefelde and Lovell (1977), Desai (1976). None of these estimates include data for the early 1980s, when growth rates were still lower.

<sup>61</sup> Much of the evidence advanced by Wiles, Nove, and Hanson in support of their argument about the

	$r = 0.12$		$r = 0.06$	
	$ES = 1.0$	$ES = 0.5$	$ES = 1.0$	$ES = 0.5$
1950-60	3.6	1.4	4.5	2.4
1960-70	1.8	1.1	2.6	2.0
1970-75	0.3	0.5	0.9	1.1

In both CD and CES estimates reported above, technological change is presented as neutral and/or disembodied. Some of the literature, however, assumes embodiment of technological change in capital (Gomulka and Sylwestrowicz 1976; Brada 1985, pp. 120-22, 126-27).<sup>62</sup> Two outcomes emerge: First, with embodiment more of the decline in the rates of growth is charged against the decline in the rate of growth of capital and less to systemic problems of R and D or of efficiency. Second, if embodiment is important the intended reduction in the future rate of capital growth may hamper rather than improve Soviet growth prospects (Brada 1985, p. 127). As to the interpretation of past performance, if embodiment were a dominant factor in Soviet growth then, with normal R and D performance and given the large investments, one would expect a much larger contribution of technology to growth in conventional growth-accounting calculations that neglect embodiment. That this did not occur is additional evidence of poor R and D performance in the past. While embodiment is clearly part of reality, what the Soviets lacked in the past, and what they have to worry about in the future in this

connection, is the embodiment of additional new technology per unit of investment. Merely raising the level of investment will not solve this problem, but raising the weight of new technology in well-planned incremental investment might do so. This is just another part of the cluster of dilemmas facing Soviet planners in the key sphere of investment policy.

#### VIII. *Evaluation and Conclusion—or, Can the Trend Be Reversed?*

The evaluation of the Soviet growth record and strategy in this section concentrates on the question of future prospects. Under what conditions might the present trend of low and declining growth rates be reversed? In a broader view, can sustained growth be assured under the present system? If not, what changes are needed in the system and what strategy will make it feasible?

A comprehensive attempt to project the future is given by the Sovmod econometric model (Bond 1983). The projections for 1980-2000 range between 3.3 and 2.3 percent of annual growth of GNP, the baseline projection is 3.1 percent, and the main differences between the various estimates are assumptions about productivity growth. Under the baseline assumptions, total factor productivity is estimated to grow 1.1 percent annually while under less favorable conditions it would grow 0.33 percent (Bond and Levine 1983). In conventional calculations, both rates are above the average record for the past 15 years, when total factor productivity was negative (see Table 1).

This means that even the more pessimistic Sovmod estimates must, in effect, assume some future improvement in the system's performance. As things stand now, there seems to be little chance of exogenous factors contributing to such improvement. The factors exhausting further extensive growth are all there:

existence of hidden inflation in the capital series (Section III) can be added here as further support for the low and declining efficiency of capital formation. The rise in the costs of capital formation due to such inefficiencies contributes to a rise in the price of capital relative to the general price level; and this increase in the relative price of capital should be added to the proper measure of capital inputs because it reflects the heavier burden of capital cost on the economy (Hildebrandt 1985b).

<sup>62</sup> On embodiment in modern economic growth see Maddison 1982, pp. 21-25.

Bottlenecks are cumulating and payments for past haste are due. In addition, the favorable external trade conditions of the 1970s have turned unfavorable with the sharp decline in energy and gold prices (Hewett 1985; Hewett et al. 1986; Hanson 1985). The possibility of better weather conditions over the next five years is sometimes mentioned, but there is no talk of a future favorable trend.

According to Sovmod, a shift of resources away from defense, from a baseline growth rate of 4.5 percent per year to zero growth, will produce only a 0.12 percentage point increment in overall growth, to a growth rate of 3.27 percent (Bond 1983, pp. 18–19). As pointed out above, this may be an underestimate, and it may be assumed that at least under reduced defense spending a productivity rise of 1 percent may be more likely. But recent Soviet experience with low growth rates of defense is not very promising. All these should also be weighted against the prospects of long-term cuts in defense. Other possible shifts in resource allocation are treated later.

While some studies do not rule out the possibility of a continuous decline in growth down to 2 percent per year or less, with almost no productivity growth, most seem to believe that future growth can be somewhat higher, around the baseline projection of 3 percent. It is held that such a rate would allow the Soviet Union to "muddle through" just above the critical political and consumption incentive thresholds, and it would even qualify as acceptable sustained growth for a relatively mature economy such as that of the Soviet Union (Berliner 1983a, pp. 42–44; Hunter 1979; Schroeder 1983; Seweryn Bialer 1983). Berliner, for example, foresees the Soviet Union permanently lagging behind the world leaders in technology, a position that, while it has its disadvantages, also has some benefits and may in any case be "appealing

to R & D people operating in a risk-averse bureaucratic structure" (Berliner 1983a).

In terms of the distinction between a technological leader and a follower, Berliner seems to advocate a follower position. It may be true that the Soviet Union has been striving to reach the technological frontiers, but as we have seen, it is finding it very difficult to be an efficient follower.

"Muddling through" may be attained with the help of what the literature calls "moderate" (Colton 1986, Ch. 4) or "liberal" reform (Berliner 1983a, 1983b), as distinct from no reform or minor changes on the one hand, or radical systemic change on the other. But even if muddling through with some reforms is feasible, it is much less than what the present Soviet leaders consider acceptable. They have gone on record demanding significantly higher growth rates. Gorbachev has publicly insisted on at least 4 percent growth instead of the existing 3 percent, and the new plans unveiled late in 1985 call for GNP increases of 4–5 percent and more in 1986–2000 (Hanson 1985; Hewett 1985; Keith Bush 1986). While such goals are more modest than earlier unrealized plans, and catching up with the West is not mentioned as a major goal, it must be considered that all increments above 2–2.5 percent growth must come from rising efficiency. Given the perceived internal and external needs and aspirations, the Soviet leaders cannot accept the "slow-growing mature economy" argument even if growth rates in many industrial countries have recently declined. This is utterly unacceptable at a GNP per capita level of just one-half of that of the USA. Nor can one accept for the long run a 2–2.5 extensive growth rate without productivity growth as "sustained" in the real, Kuznetsian meaning.

It has been clear for some time that without some fundamental changes the

Soviet system cannot resume more dynamic growth. Theoretical analysis of possible reforms was a permanent element of economic analysis in the West all along. Over the last five years this discussion was joined by much more active reform efforts by Andropov and lately Gorbachev. The discussion that follows on changes that may reverse the trend combines some of the abstract discussion with actual measures that are being taken or that are in a planning stage.

Before discussing the main possible directions of reform, three lessons of past reforms should be mentioned. First, the growth record of the past generation was accompanied by a permanent stream of reforms, some of which were considered quite radical in their day. It is difficult to estimate their net impact, but they were not enough to stop the declining trend of growth (Berliner 1983a; Schroeder 1979, 1982; Colton 1986, Chs. 1-2). Second, the partial or marginal reforms often had side effects that offset at least some of the benefits. A shift in the incentive structure in one direction may harm other goals and, in addition, may cause superfluous activity in the direction of the new incentives. Moreover, most attempts at partial reform did not live up to expectations because they conflicted with the unaltered principles of the system in other sectors or activities. An exaggerated metaphor for partial reform is a gradual shift of traffic from one side of the road to the other, a bit at a time.

Finally, reforms suffer from the haste factor: The leadership is too impatient and is reluctant to pay the necessary short-term introduction costs for long-term benefits. As rates of growth decline and pressures to perform routine tasks grow, this reluctance becomes even more entrenched. The outcome is that the more a reform is needed, the more difficult it becomes to implement. This may eventually lead to a crisis where

drastic reform becomes indispensable.

The possible economic reforms designed to encourage faster growth, discussed in the literature, range, to use Berliner's and Colton's terms, from reactionary reform, through conservative-marginal, to moderate or "liberal" and to a radical far-reaching reform (Berliner 1983b; Colton 1986, Ch. 4). The reactionary model calls for tightening central control, improving the system of central planning, and the reinstitution of various disciplinary and coercive measures as the major means to raise efficiency. More resources can thereby be devoted to investment (defense) and to growth. A comprehensive application of such reforms is ruled out by most observers except under acute conditions of international crisis. Nor do specialists believe in their effectiveness at this stage; however, partial implementation of stronger disciplinary measures, work discipline, more responsibility by administrators, and antialcohol campaigns are part of the changes introduced by Andropov and reemphasized by Gorbachev. They serve as part of the proposed reform and as stopgap changes while other reforms are being contemplated.

At the other end of the range is a "radical" reform whose essence is the conversion of central planning into a system of market socialism in which central planning would be phased out in favor of decentralization and market mechanisms, possibly like the "new management mechanism" of Hungary since 1968 (Kornai 1986). Such a change involves, of course, a shift in resource allocation toward higher rates of growth of consumption and more slack in the economy, as well as major ideological and power-structure shifts. In a way, the prospects of such a radical change are of minor interest here because when implemented they will draw the Soviet system much closer to the present-day mixed econo-

**Bottlenecks** are cumulating and payments for past haste are due. In addition, the favorable external trade conditions of the 1970s have turned unfavorable with the sharp decline in energy and gold prices (Hewett 1985; Hewett et al. 1986; Hanson 1985). The possibility of better weather conditions over the next five years is sometimes mentioned, but there is no talk of a future favorable trend.

According to Sovmod, a shift of resources away from defense, from a baseline growth rate of 4.5 percent per year to zero growth, will produce only a 0.12 percentage point increment in overall growth, to a growth rate of 3.27 percent (Bond 1983, pp. 18–19). As pointed out above, this may be an underestimate, and it may be assumed that at least under reduced defense spending a productivity rise of 1 percent may be more likely. But recent Soviet experience with low growth rates of defense is not very promising. All these should also be weighted against the prospects of long-term cuts in defense. Other possible shifts in resource allocation are treated later.

While some studies do not rule out the possibility of a continuous decline in growth down to 2 percent per year or less, with almost no productivity growth, most seem to believe that future growth can be somewhat higher, around the baseline projection of 3 percent. It is held that such a rate would allow the Soviet Union to "muddle through" just above the critical political and consumption incentive thresholds, and it would even qualify as acceptable sustained growth for a relatively mature economy such as that of the Soviet Union (Berliner 1983a, pp. 42–44; Hunter 1979; Schroeder 1983; Seweryn Bialer 1983). Berliner, for example, foresees the Soviet Union permanently lagging behind the world leaders in technology, a position that, while it has its disadvantages, also has some benefits and may in any case be "appealing

to R & D people operating in a risk-averse bureaucratic structure" (Berliner 1983a).

In terms of the distinction between a technological leader and a follower, Berliner seems to advocate a follower position. It may be true that the Soviet Union has been striving to reach the technological frontiers, but as we have seen, it is finding it very difficult to be an efficient follower.

"Muddling through" may be attained with the help of what the literature calls "moderate" (Colton 1986, Ch. 4) or "liberal" reform (Berliner 1983a, 1983b), as distinct from no reform or minor changes on the one hand, or radical systemic change on the other. But even if muddling through with some reforms is feasible, it is much less than what the present Soviet leaders consider acceptable. They have gone on record demanding significantly higher growth rates. Gorbachev has publicly insisted on at least 4 percent growth instead of the existing 3 percent, and the new plans unveiled late in 1985 call for GNP increases of 4–5 percent and more in 1986–2000 (Hanson 1985; Hewett 1985; Keith Bush 1986). While such goals are more modest than earlier unrealized plans, and catching up with the West is not mentioned as a major goal, it must be considered that all increments above 2–2.5 percent growth must come from rising efficiency. Given the perceived internal and external needs and aspirations, the Soviet leaders cannot accept the "slow-growing mature economy" argument even if growth rates in many industrial countries have recently declined. This is utterly unacceptable at a GNP per capita level of just one-half of that of the USA. Nor can one accept for the long run a 2–2.5 extensive growth rate without productivity growth as "sustained" in the real, Kuznetsian meaning.

It has been clear for some time that without some fundamental changes the

Soviet system cannot resume more dynamic growth. Theoretical analysis of possible reforms was a permanent element of economic analysis in the West all along. Over the last five years this discussion was joined by much more active reform efforts by Andropov and lately Gorbachev. The discussion that follows on changes that may reverse the trend combines some of the abstract discussion with actual measures that are being taken or that are in a planning stage.

Before discussing the main possible directions of reform, three lessons of past reforms should be mentioned. First, the growth record of the past generation was accompanied by a permanent stream of reforms, some of which were considered quite radical in their day. It is difficult to estimate their net impact, but they were not enough to stop the declining trend of growth (Berliner 1983a; Schroeder 1979, 1982; Colton 1986, Chs. 1-2). Second, the partial or marginal reforms often had side effects that offset at least some of the benefits. A shift in the incentive structure in one direction may harm other goals and, in addition, may cause superfluous activity in the direction of the new incentives. Moreover, most attempts at partial reform did not live up to expectations because they conflicted with the unaltered principles of the system in other sectors or activities. An exaggerated metaphor for partial reform is a gradual shift of traffic from one side of the road to the other, a bit at a time.

Finally, reforms suffer from the haste factor: The leadership is too impatient and is reluctant to pay the necessary short-term introduction costs for long-term benefits. As rates of growth decline and pressures to perform routine tasks grow, this reluctance becomes even more entrenched. The outcome is that the more a reform is needed, the more difficult it becomes to implement. This may eventually lead to a crisis where

drastic reform becomes indispensable.

The possible economic reforms designed to encourage faster growth, discussed in the literature, range, to use Berliner's and Colton's terms, from reactionary reform, through conservative-marginal, to moderate or "liberal" and to a radical far-reaching reform (Berliner 1983b; Colton 1986, Ch. 4). The reactionary model calls for tightening central control, improving the system of central planning, and the reinstitution of various disciplinary and coercive measures as the major means to raise efficiency. More resources can thereby be devoted to investment (defense) and to growth. A comprehensive application of such reforms is ruled out by most observers except under acute conditions of international crisis. Nor do specialists believe in their effectiveness at this stage; however, partial implementation of stronger disciplinary measures, work discipline, more responsibility by administrators, and antialcohol campaigns are part of the changes introduced by Andropov and reemphasized by Gorbachev. They serve as part of the proposed reform and as stopgap changes while other reforms are being contemplated.

At the other end of the range is a "radical" reform whose essence is the conversion of central planning into a system of market socialism in which central planning would be phased out in favor of decentralization and market mechanisms, possibly like the "new management mechanism" of Hungary since 1968 (Kornai 1986). Such a change involves, of course, a shift in resource allocation toward higher rates of growth of consumption and more slack in the economy, as well as major ideological and power structure shifts. In a way, the prospects of such a radical change are of minor interest here because when implemented they will draw the Soviet system much closer to the present-day mixed econo-

mies; the prospects for sustained growth of a Soviet-type socialist system from the present stage is thus left untested. So far, Gorbachev strongly rejected the possibility of introducing market socialism of the Yugoslav or Chinese style (Bialer and Joan Afferica 1986, pp. 608-13).

The middle ground of the reform range is occupied by the "moderate" reform. Under such reform the basic authoritarian regime and central planning system are assumed to persist, but a number of significant changes in them are contemplated and the distance traveled in each direction may vary. Many of the steps listed below under "moderate" reform are in fact included in what is emerging now in the package of reforms initiated by Gorbachev.

The "Gorbachev reforms" have been formulated as a complete strategy only very recently, at the meeting of the plenum of the Communist Party last June (Gorbachev's speech, and the main document approved, "Basic Provisions for Radical Restructuring of Economic Management," *Pravda*, June 26 pp. 1-5, and June 27, pp. 2-3, respectively). Only a small part of the reform provisions have been put into effect so far, and most of it awaits detailed formulation and implementation. The main effort of the reform is in "restructuring" the economic mechanism so as to achieve, in Gorbachev's words, "the union of centralism and independence of economic organization" (quoted by Berliner 1986 p. 8). It is an attempt to create the entrepreneurship, dynamism, creativity, and flexibility of the market economy in a more decentralized, but still centrally directed environment. This effort includes radical streamlining of the top administrative and planning bodies, and relieving them from much of the burden of the short-term operational direction of enterprises. A considerable part of the supply of materials and goods will be turned to wholesale

trade network where voluntary deals will be struck. Following a major price reform, many prices will be determined by the contracting parties. Much of the previously central financial allocation and control system will be turned to newly established banks that will offer regular credits. Enterprises, with much more freedom of action over plans, over the use of funds, for investments, wages bonuses, over sources of supply and sales, and even prices, will be run according to the principle of "self-financing" where all costs, including taxes will come out of earned revenues; thus profits and sales will be the main success criteria and the source of remuneration. Losing enterprises will eventually be forced to close and the workers will be transferred. Liberalization is being extended also to international trade, where some freedom of action has been granted to individual enterprises and ministries, and joint ventures with Western companies are permitted. The exact division of power between the central administration and market-like mechanisms will determine how radical the reform will be in the core of the economy. With limited free action the system will not be very different from the present one, but with significant reduction in the role of administrative measures it could border on the radical. (See discussion on this issue in Kornai 1986, pp. 1699-1700.)

The second direction of the proposed reform is in enlarging the role and scope of the legal private and cooperative sector, where real markets and market prices and motivations prevail. The Soviet system has probably been the most extreme among the socialist countries in limiting private economic activity all along. In addition to legal private agricultural plots and more or less free farmers' markets for their produce, very limited urban private activity was allowed. The proposed reform enlarges the scope of

private food production and of the production and provision of many services and some products—by private people or cooperatives (as approved by the new law of individual activity that went into effect in May 1987) and by allowing some private-market type activities in collective farms and public sector enterprises, like permission to sell above-quota or above-contract production on the free market or to contract out to private people or cooperatives segments of production (*kolkhozi*, running a computer system for a factory, or developing and introducing an innovation for it). Finally, privatization could mean more liberal policies with respect to the import of technology, even to the point of allowing direct investment of foreign capital in some joint ventures (as under another of the new reform laws).

The increased role of the private sector under such reforms is designed to raise efficiency in spheres where central planning is especially weak, to reduce the burden of central planning, and probably most important, to increase the supply of consumer goods and services in key sectors, thereby raising the level of work motivation of the population. If the supply of privately produced business services to the public sector is also allowed, it may help ease key bottlenecks and make supply response more flexible. Finally, privatization of service activities may raise the share of services in the national product and move the industrial structure of the Soviet economy closer to a "normal" pattern of growth, in which rapid growth of the share of services is a main feature.

The third direction of the reform is the "democratization" of the cultural, social, and political spheres to which we will return below.

A key question relates to the expected effect of reform on Soviet R and D. Final judgment must be left to the future, but

whatever the possible effects, some observers believe that present and anticipated technological frontiers impose even tougher obstacles on the Soviet system than earlier ones did. The main thrust of the Soviet industrialization drive took place at a time when the dominant technological advance was concentrated in heavy industry and machinery, energy, and raw materials. In a way, this suited the goals and structure of the Soviet system. But the technological frontier has shifted to electronics, computers, and communications—toward an "information-intensive economy" (Heymann 1985, p. A-1). There are any number of reasons to assume that the Soviet system is less suited for this revolution. Among other problems, Heymann suggests the following:

Soviet society—as is now beginning to be recognized by the new Gorbachev leadership—is handicapped by a socio-political organization ill suited to the adoption and assimilation of an information-intensive culture: its highly centralized approach to management and decision making; its dearth of reliable data bases and the wall of secrecy with which it surrounds them; the poor quality and availability of its telecommunications links; its discouragement of entrepreneurship and risk taking (uncoordinated small-team, competitive ventures do not exist); its tradition of ignoring the needs and wishes of customers and users; and its abhorrence of the wide-open, chaotic marketplace, where a staggering variety of profit-motivated buyers and sellers contend—these and other features hamper and constrain the society's ability to adjust to and benefit from the information revolution. (Heymann 1985, pp. A-1, A-2)

Three specific problems of introducing the information revolution into Soviet society must be emphasized. First, the process of innovation is hampered by the fact that the use of the new developments must be diffused across the entire economy and not concentrated in a well-defined branch. Second, its main uses in production are antagonistic to long-established traditions of management and con-

trol. Finally, possibly most important, the benefits of the information revolution in a society and culture that is based on monopolization of information, on secrecy, and on the denial of basic freedoms are limited. A society that severely limits the use of photocopying machines and mass communication systems has little taste for the information revolution (Colton 1986, p. 170; on the general theme see also Graham 1984, pp. 129-32; Richard W. Judy 1986).

Gorbachev's "openness" (*glasnost*) reform of partly lifting the veil of secrecy on social and economic information, of calling for open criticism, of more freedom of expression in the arts and culture, and even some democratization of political structures and processes, are motivated by more than one reason—among others, by a desire to raise the level of efficiency of the economic mechanism and to contribute to the "human factor," the key element in reconstructing the economy and society. These can be seen as responses to the problems mentioned above. Time will show how much openness will ultimately be tolerated and how far it will go to meet these problems.

It is difficult to evaluate theoretically how extensive the changes must be to generate the needed turnabout in growth rates. It is no less difficult and much too early to say whether the present reforms contain a critical mass of the ingredients of autonomy, flexibility, incentives, motivation, and freedom needed for enhanced efficiency and more dynamic technological advance. What we can state is that these reforms, as described above, and the recent patterns observed so far in the Soviet Union appear to be less radical in most respects than their Hungarian, Yugoslav, or Chinese counterparts.

Second, it is also difficult to determine in advance whether the changes that may

bring the Soviet economy back to more rapid growth will or will not move the system away from its "socialist" character. Can they be effective without giving up public ownership of most means of production? Or without opening up income and wealth differentials larger than are ideologically acceptable? Or without giving up too much of the central political authority.

A third question with an uncertain answer is whether the minimum reform needed for economic recovery can be pushed through the Soviet political establishment and social structure. There is evidence and open discussion of internal opposition to reforms on academic, ideological, political, and self-interest grounds (Hanson 1985; Tat'yana Zaslavskaya 1984; Colton 1986, pp. 166-76). Zaslavskaya's 1983 report, secret at the time, is a bold description by an insider of the extent of expected opposition by vested-interest groups that stand to lose power and income. Whether or not a "moderate" reform is strong enough to effect the necessary change, it is certainly considered quite radical by many Soviet and non-Soviet observers (Hanson 1985, p. 307).

In addition to reforms in the economic mechanisms and institutions, economic reforms also include changes in resource allocation. Three such general changes seem to be in prospect, also part of a scheme of moderate reform. First, moderate reform calls for a stronger reliance on material standard-of-living incentives. This translates into more resources earmarked for consumption, including services. Second are changes in the sphere of investment, which are engulfed by many difficulties. Up against a severe resources constraint, one has to choose a proper volume of investment, one that will cover the needs of hitherto neglected infrastructure, depleted natural re-

sources, embodied technology in machine building and replacing antiquated equipment (antiquated even according to Soviet norms), while attending to the mounting stock of unfinished projects and over-long lead times. One manifestation of these hard choices is the zig-zag pattern of Soviet investment policies since the late 1970s and early 1980s. In this period we have witnessed, first, attempts to lower the overall growth rate of investment and to divert it from machine and metal production toward agriculture and energy. These attempts had to be abandoned and reversed during the early 1980s. Then in the present (12th) FYP, we find on the one side a modest growth of overall planned investment for 1986-90, but on the other an exceptionally high rate set for the first year (1986), with renewed reemphasis on investment in the machine-building sector (Schroeder 1985; Hewett 1985; Hanson 1985; Hewett et al. 1986; Bergson 1986; Colton 1986, Ch. 4). Time will tell whether these efforts prove successful in raising the marginal productivity of capital.

Third is an effort to reduce, if possible, allocations to defense. The feasibility of such a move depends significantly on the development of a favorable international environment, especially in East-West relations. Arms reduction, lower pressure on military R and D, more opportunities for Western credits and technology, all are favorable to the internal efforts. The Soviet leadership should definitely be interested in promoting such an environment.

Internal policy dilemmas, external uncertainties, including those related to the future terms of trade, and uncertainties connected with the nature and outcome of reforms, all found expression in both the many revisions of the current, 12th FYP, and in the many apparent inconsistencies remaining in it. These inconsis-

tencies raise some doubts about the feasibility of achieving even the modest targets of consumption (Bush 1986).

Oscar Lange, in his treatise on socialism (Benjamin Lippincott 1938), concluded that one of the system's major potential economic advantages is in the field of technological innovation. He considered the ability of one center to sponsor, direct, and then diffuse new technologies to be the answer to the failure of the market economy to yield a constant stream of innovations. As it turned out, Lange was wrong: the flexibility of the market economies, aided by a mixed strategy including some degree of government regulation and intervention proved able to generate continued innovation. On the other hand, technological change only by command proved much less successful.

George Orwell and others viewed the development of modern communications and information technologies as the ultimate weapon of control, brainwashing, and repression at the hands of authoritarian regimes. They may be right, but these inventions also carry a great economic potential for a free society that can put them to use in a different way, on a much wider scale, for far greater social benefit.

In his five-and-a-half-hour report to the 27th Congress of the Soviet Communist party (and in many speeches before and since), Gorbachev (1986) acknowledged the problem of decelerating growth rates, blamed it among other things on the failure to move from extensive to intensive methods of production, criticized most past reforms as mere rhetoric, and pledged to reverse the trend by introducing the scientific and technological revolution and carrying out a "truly revolutionary change" (Gorbachev 1986, pp. 29-33)—a total "economic and

social reconstruction" of Soviet society.<sup>63</sup> There is some debate among experts as to whether Gorbachev has the right picture in view, the correct prescription for redirecting Soviet society and its economy toward sustained economic growth, and the energy and ability to push it through. For the time being the skeptics dominate, and their reasons are strong (see Hewett 1986; Schroeder 1986; Jerry F. Hough 1986; Hanson 1986); but we all have to bear in mind that it is rare for analysts to foresee radical changes or sudden shifts in long-established trends. Only time will tell whether the present Soviet leadership possess the attributes necessary to effect such a sweeping turn.

## Historical Perspectives and the Interpretation of Unemployment\*

By Michael J. Piore

*Massachusetts Institute of Technology*

IN THE LAST DECADE, the levels of unemployment in industrialized countries have risen dramatically. Rates now are typically two, and in some cases, three and four times those prevailing in the 1950s and 1960s. The fact that these new higher levels are widely tolerated suggests that our thinking about the meaning and significance of unemployment has changed enormously over the period. Such a change is certainly present in the thinking among professional economists. In the 1960s the standard view was that the unemployed represented unutilized resources; their existence in an economy where the vast majority of people had unsatisfied wants was seen as a major social paradox and the most important unsolved intellectual puzzle of the capitalist economic system. This fed the rationale for Keynesian countercyclical fiscal policy and government deficit spending: The government could reasonably print money in order to hire the unemployed because the resources absorbed in the process were essentially "free goods."

Today, a good number of professional

economists, certainly in the United States but to a lesser extent throughout the world, have come to view measured unemployment in industrial economies as an *artifact* in at least three senses. It is a statistical artifact of a measurement process that classifies as unemployed people who are not really available for work. It is an institutional artifact of a system of social insurance and public welfare that encourages an extension of the process of job search. And it is an artifact of the language that uses a term which in everyday parlance means forced idleness for activities that have important productive functions akin to the functions of inventories, information processing, and investment associated with the utilization of capital goods. These interpretations to be sure hardly constitute a consensus about the meaning of unemployment. But they are no more diverse than the range of views that underlay the older orthodoxy. And for policy makers and economic researchers, they carry a single message: There are many more serious problems toward which to direct attention.

These new views about unemployment were developed out of a set of ideas originally associated with the Chicago School of economics, where the emphasis—at once positive and normative—was placed on the competitive market as the gover-

\* A Review of Alexander Keyssar, *Out of Work: The First Century of Unemployment in Massachusetts*. Cambridge: Cambridge University Press, 1986 and Robert Salais, Nicolas Baverez, and Bénédicte Reynaud, *L'invention du chômage: Histoire et transformations d'une catégorie en France des années 1890 aux années 1980*. Paris: Presses Universitaires de France, 1986.

nor of labor market activity. The mainstream of the economics profession continued for a long time to work from models that presumed the older view, and in the process failed to provide an effective counter to either the empirical evidence or the theoretical propositions that made the new views seem reasonable and increasingly coherent. Analysts who on other issues were quick to criticize the prevailing orthodoxy from an institutional, historical, or Marxist perspective followed the main body of the profession in this regard and never developed an independent position. As the old orthodoxy has collapsed therefore, there has been no coherent counterweight to the essential complacency of the new position.

These two books, which appear more or less coincidentally, constitute the first really original effort of scholars working from a critical perspective to confront and come to terms with the new orthodoxy. They start from the presumption that the economy must be understood as the product of a continuing historical evolution and as embedded in social processes. In this they stand in contrast to mainstream economics, and particularly the theoretical ideas out of which the new understanding of unemployment is built, in the sense that the analytical approach of the latter is ahistorical and makes a radical separation between the economy and society. In addition, both books share the preoccupation, prominent today in anthropology and sociology and common to much of contemporary Marxist thought, with the working out of the precise relationship between the realm of ideas and the productive structure itself, a relationship that orthodox Marxists took for granted and in which mainstream economics is basically not interested at all. Despite these common intellectual roots, however, the two books suggest almost diametrically opposite conclusions

about the meaning of unemployment in modern times and the validity of the newly dominant interpretations.

# I. *Salais et al.*, *L'invention du chômage*

Salais and his colleagues are directly concerned with the emergence of the new high unemployment levels in France in the 1970s. They approach this problem through a complex and sophisticated blend of quantitative statistical and qualitative historical analysis.

The statistical analysis focuses on the pattern of variation in unemployment rates across French departments, basic geographic units of the French administration roughly comparable to U.S. states. They look at this pattern in four separate years (1896, 1936, 1970, and 1980) and are thus able to see how it has changed over time. For each department, they collected a large and disparate group of variables. These include the demographic composition of the population and the distribution of the labor force between industry and agriculture and by urban size and size of establishment.

A standard approach would be to use these data to estimate demand and supply curves for labor in each of the periods. The variables, however, are highly intercorrelated, and it would be difficult to identify the two curves. Salais et al. take the position that a set of more fundamental forces are operating simultaneously on both sides of the labor market, and it is these forces, not supply and demand, that are of analytical interest. To uncover these forces, they turn to principal component analysis. This technique constructs out of a series of highly intercorrelated variables a new and smaller set of measures: the principal components. The principal components are linear combinations of the original variables and have the property of being those combinations that account for most of the variation in the original set. The principal

components are also orthogonal to (that is, uncorrelated with) each other. They can thus be interpreted as "purer" variables, measures of the underlying processes at work. The dispersion of the effects of these "underlying processes" over the original set of variables is interpreted as accounting for the intercorrelation that principal components analysis as a statistical techniques is designed to eliminate.

This approach is widely used in psychology and sociology but economists are uncomfortable with it, especially where the original set of variables have direct interpretations in terms of conventional theory and the principal components do not. Salais et al. circumvent this problem by building the interpretation of the principal components out of their qualitative analysis. Here their evidence is drawn from what might be termed *case studies* of the employment relationship and the way in which the evaluation of that relationship is connected to the changing social structures within the enterprise, the profession, and the residential community. Interestingly, much of this evidence was generated as part of the debate among statisticians going back to the nineteenth century about the meaning of unemployment and how it should be measured.

The story which emerges in this process is that the modern concept of unemployment derives from one particular employment relationship, that of the large, permanent manufacturing establishment. Employment in such institutions involves a radical separation in time and in space from family and leisure time activity and was (and is) relatively permanent. When employment ties of this kind are severed, there is an empty space in the worker's life which is sharply defined and that space is what is meant by unemployment. In early twentieth-century France, there were, however, a number

of other types of work structures in which the terms *employment* and *unemployment* had rather different connotations. In agriculture and in a variety of different family enterprises in industry and commerce, market and household activities were so intermingled that the line between them was difficult to draw and adjustments to variations in economic conditions were made through changes in the distribution of time between various tasks. These changes were not registered by measures of unemployment at all. In rural areas and small towns, workers frequently moved back and forth between their own farms and industrial employment in small enterprises with an ease and frequency that also escaped conventional measures of unemployment. When there was not enough work to keep everybody busy, workers were still supported by other family members either on the farm or in the workshop.

In large urban areas where social ties were weak, forms of public assistance gradually developed to sustain workers from such small enterprises that occasionally fell through the net of family relations in which work relationships were typically embedded. Such workers were then formally classified as unemployed. But in this situation, the category *unemployment* was ambiguous because such workers were not conceptually distinct from similar people who, even in urban areas, and to a much larger extent in small towns and villages, were absorbed into the extended family, sharing family resources and assuming domestic tasks.

Still another type of employment typified the crafts. Craft workers were attached to their professions rather than to particular employers and often moved regularly from one employment establishment to another. The level of employment within a craft, moreover, often had a marked seasonal pattern involving prolonged periods when work was scarce or

nonexistent, but workers anticipated these off-periods and tended to accommodate them through the social and cultural institutions associated with craft work. Typically, craftsmen were organized into associations with mutual insurance funds to sustain their members during the slack season. Early statisticians were confused and divided as to whether craftsmen out of work during the slack season and drawing upon funds of this kind should be counted as unemployed.

The turning point in the emergence of unemployment as we know it today, Salais and his colleagues argue, was the Great Depression of the 1930s. The modern category of unemployment emerged out of two distinct effects of the economic collapse. First, very large numbers of workers were displaced from the large industrial establishments in terms of which *unemployment* had its clearest meaning. Second, under the pressure of the depression, the variety of social networks, mutual insurance funds, and local public support systems associated with other employment relationships were broken, or so strained that the state was forced to intervene. But while the two effects were conceptually distinct and both proved to be temporary, a single permanent institution was created to deal with them: a general system of unemployment insurance. And the model of the employment relationship upon which that system was built was that of the employment relationship in large industrial enterprises. In the subsequent period of postwar prosperity, workers and employers were induced by the existence of this system increasingly to structure their employment behavior upon the large enterprise model.

These institutional changes appear clearly through the statistical analysis: The principal components that reflect the employment institutions are important in accounting for the interdepartmental var-

iation in unemployment rates in the pre-World War II period, but their importance drops substantially in the postwar years of 1970 and 1980.

There is a certain resemblance between this story and the argument that workers have been induced to behave as unemployed by the fact that they thereby become eligible for unemployment insurance payments. But the argument here is more sophisticated and ultimately very different. First, there is a set of institutions in the economy in terms of which the initial concept of unemployment and the institutional structures which derive from that concept are defined: Unemployment has a clear and unambiguous meaning in terms of these institutions. Second, the category of unemployment is enlarged, not by inducing individuals to alter their behavior, but by changing other institutions so that they come increasingly to resemble the paradigmatic structure in terms of which unemployment is defined.

Finally—and this is perhaps the most intriguing part of the Salais et al. argument—the process of imposing one institutional paradigm upon an initially heterogeneous structure is not something that is confined to, or can be understood in terms of, unemployment alone. It extends to the whole social and economic policy of the state. A good part of the book is thus devoted to showing how, in the period extending from the Popular Front through the Liberation, the French came to see the large industrial enterprise as the critical economic institution of the modern industrial state and how the state pushed—not only in labor policies but through financial subsidies, the tax system, and indeed through virtually every instrument of statecraft—to force smaller productive institutions to merge in order to create the paradigmatic structures of the modern French economy. Indeed, they argue that the spread

of Keynesian economics, through which unemployment came to be recognized and understood as an analytical concept, has to be understood as part of the process through which the state imposed the structures of large enterprises upon the system as a whole. Here again, it is easy to confuse this argument with that of American economists who see unemployment as "artificial." For proponents of that view, the institutional structure of the French economy will be seen as the product of artificial state intervention. But Salais and his colleagues see state action in this respect as the product of an intellectual process. And indeed, the ideas upon which it was based were accepted by politicians and policymakers distributed across the political spectrum. Their success in pursuing the policy of institutional transformation was undoubtedly due to the fact that the ideas were ultimately accepted by the custodians of the institutions that had to be transformed. In this sense, state action is an expression of underlying social and historical processes, not something separate and exterior to them. State action cannot be artificial in this view of the world in the sense that it can in orthodox theory where the economy on the one hand and the society on the other are modeled as so separate that entrance of the latter in the domain of the former can be termed unnatural.

What conclusions does this argument then suggest about contemporary unemployment? The unemployment of the last decade, like that of the Great Depression, is the product of the unanticipated collapse of a large portion of the older institutional structure. The huge layoffs in heavy manufacturing industries like steel, automobiles, and shipbuilding, which were once thought symbolic of the modern age, are representative of this process. Because the collapse is unanticipated, existing institutions cannot deal

with the problem. Salais and his colleagues take it for granted that the society has an obligation to help those who are suffering in the process. The danger is that in the attempt to do this, we will inadvertently create the structures that determine the emergent economic order. It is the character of that order, and not unemployment per se, that is the critical issue, and it is toward that which the book ultimately directs our attention.

## II. *Alexander Keyssar, Out of Work*

Alexander Keyssar is also concerned with the changing meaning of the term *unemployment*. His focus is on nineteenth-century Massachusetts. In the early nineteenth century, unemployment as we know it today does not seem to have existed as a category, at least in the modern sense of the term. The word was widely used, but it referred mainly to "those who were simply 'not employed,' who were idle or not working" (p. 3). It thus included small children, who were never engaged in productive labor and grown men who had taken the day off to go fishing. By the end of the century, however, it had come to be understood exclusively in the modern sense of "involuntary idleness," wanting a job but being unable to find one. The central question of the book is thus: What happened in the course of the nineteenth century to produce this linguistic transformation?

Keyssar is a social historian, not an economist, and his answer to the question is based largely upon traditional historical sources: documentary evidence, gathered from the newspapers, government reports, trade union pamphlets, civic organizations, and the casework of charitable organizations and social workers supplemented by case studies by other historians of particular industries,

industrial communities, and businesses, which, for Massachusetts, are numerous. He presents statistical material when it becomes available. For the latter years, it is fairly extensive: the federal census of 1890, 1900, and 1910; Massachusetts census in 1885 and 1895; and a special survey of the Massachusetts Bureau of Statistics of Labor of unemployment among trade unionists, quarterly from 1908 through 1923. There are serious problems of comparability among these different surveys. Keyssar is well aware of these problems, but he is extremely apologetic about burdening the reader with discussion of them. They are confined to footnotes and appendices and even there, from an economist's point of view, are teasingly abbreviated. But because the statistics are used largely to illustrate or amplify the documentary evidence, the data are adequate to bear the weight of the argument they are asked to carry.

The explanation for the emergence of unemployment which Keyssar abstracts from his material is similar to that of Salais and his colleagues, but also different. The similarities lie in the social structures in which work is embedded and which act to cushion the impact of fluctuations in economic activity. At the beginning of the nineteenth century, industrial work in Massachusetts, as in much of early twentieth-century France, was combined in close geographic and institutional proximity to domestic work and agriculture. It tended to be done in small household-based workshops or put out to farmers. Thus, when industrial activity was slack, industrial workers simply shifted to farm tasks or household maintenance; when demand picked up, they shifted back to industrial activity. In the course of the century, however, work moved off the farms and out of the household into factories that were separated socially, geographically, and institution-

ally. When factory work fell off, workers could not therefore easily shift. They were without a job and finding something else to do involved a distinct effort, a recognizable period of time and social space. That space came to be referred to as *unemployment*. Keyssar does not make the distinctions between large and small enterprises or more or less urbanized environments that loom so large in Salais et al., but otherwise the notions of social space and its emergence through structural change in the two books are coincident. Keyssar's book is different from that of Salais et al. in the sense that Keyssar does not really explain why or how this structural change occurred. Instead he concentrates on documenting the change, the amount of unemployment (in the modern sense of the term) to which it gave rise, and the impact of the unemployment on workers' lives. As a result, he leaves the impression that the changes are the natural and inevitable product of industrial, or as Keyssar himself would probably term it, capitalist development. There is no choice or act of will. The result is an extremely effective reply to the new economic orthodoxy. Keyssar shows us what the world looks like in which unemployment means leisure activity. He documents the disappearance of that world and makes clear that it is not the world we live in today. He also shows that contemporary institutional structures such as unemployment insurance and layoff by seniority, which analysts now tend to view as a "cause" of unemployment, actually emerged in response to unemployment, and asserts that while they may, in fact, have changed its distribution, they have done little to alter the level.<sup>1</sup>

The book also addresses a number of

<sup>1</sup> His quantitative analysis is not enough actually to sustain this last point, but the much more sophisticated statistical work by Christina Romer (1986a, 1986b, 1986c) in the last year makes it plausible.

issues that have emerged as a by-product of the new orthodoxy. For example, Keyssar shows that in the nineteenth century, before there were any of the institutional restraints such as unemployment insurance or recall rights which modern analysts have argued distort decisions, workers tried to shift geographically in response to variations in the distribution of demand, but demand was so erratic even across firms in the same industry that it was impossible for even an extremely mobile labor force to keep up with its variations. But the book leaves us at a complete loss as to what to do about unemployment. Keyssar does not seem to believe that we can go back to the early nineteenth-century economic structures; indeed, he leaves the impression that this would cost us dearly in terms of our standard of living. And, yet, he seems to see little that we might do to reduce unemployment within the existing economic structures and he offers us no vision of an alternative structure toward which we might move in the future. Somewhat paradoxically, therefore, Keyssar leaves us with a certain nostalgia for the position he seems to have destroyed. It, at least, offered the possibility of measures we might take to improve the world.

### III

How does one explain the difference between the perspectives of these two books?

To a great extent, that difference reflects the differences in the intellectual traditions out of which they have developed. Salais et al. are the product of contemporary French labor economics and industrial relations, a tradition of thought whose major preoccupation has been the attempt to understand the historical evolution of institutional structures. It has been driven by what is, especially for

France, unusually rich case-study material of actual business practices that scholars have tried to understand by an eclectic theoretical approach, borrowing freely from Marxist and orthodox economic theories as well as American industrial relations, labor market segmentation, and radical economic theory.

Three developments growing out of this tradition seem particularly important for the understanding and interpretation of the Salais book. The first is the work of *Laboratoire d'économie et de sociologie du travail* (LEST) in Aix-en-Provence comparing the organization of industrial work in France and Germany (Marc Maurice et al. 1982, 1986). The LEST studies started with the observation that the distribution of wage and salary income is much wider in France than it is in Germany. They tried unsuccessfully to explain this difference through successively finer disaggregations of the data until ultimately in the early 1970s they were able to reduce the problem to the plant level. They formed 12 pairs of plants, each pair composed of a plant in France matched on the basis of size, product, and production technology with another in Germany. At this level, they were able to trace the difference in the two distributions to a series of lower-level managerial employees that were found in the French plants but not in the German ones. In order to fit these employees into the wage hierarchy, its range was widened. The LEST researchers then conducted further studies designed to explain what these "extra" managerial employees did in France and why. The essential result is that the same work in France is organized completely differently from that in Germany: To simplify, the French make a much more radical separation between the tasks of conceptualization and execution than do the Germans, and French lower-level managerial workers carry a range of design

and planning functions that German rank-and-file workers perform themselves. This difference is in turn related to profound differences in the structure of the educational systems (there is more formal education in France, more on-the-job training in Germany), in industrial relations (adversarial in France, cooperative in Germany), and in the nature of day-to-day social interaction in the two countries (French social relations are structured to avoid personal confrontation). It is reflected not only in differences in the distribution of wage and salary income, but also in the nature of career paths and in the degree of worker autonomy, on the one hand, and responsibility on the other. Indeed, the differences in the two countries extend to so many aspects of economic and social organization that it is impossible to isolate a clear chain of causality.

The LEST studies leave a lot of loose ends, and in themselves have not been fully successful in generating a theoretical explanation for the structures of the two societies. But they have fundamentally changed the type of theoretical explanation of economic and social structures that is acceptable to French scholars. Prior to these studies, most French social scientists (and probably those in the Anglo-Saxon world as well) tended to subscribe to some form of industrial or technological convergence. They believed that competitive pressures would drive all industrial societies sooner or later to adopt the one best set of industrial techniques and that those techniques would determine the key aspects of work organization and related income, education, and industrial relations structures. Given that France and Germany are at more or less equal stages in their industrial development, more or less equally successful given conventional indicators of social welfare and economic performance—and indeed the pairs of

enterprises competed directly in the Common Market—these hypotheses can no longer be sustained. The LEST studies thus open a whole new space for speculation about the origins and impact of the key structures of modern society, and it is within that space that Salais and his colleagues are working.

A second range of studies that feeds directly into the "invention of unemployment" is the on-going research at INSEE, the French national statistics institute, into the history of statistical categories. This research was pioneered by A. Desrosières (1977). Among the most important contributors are F. Eymard-Duvernay (1983, 1984), Eymard-Duvernay et al. (1983), Eymard-Duvernay and L. Thévenot (1979), Thévenot (1984), and Salais himself. All of these scholars worked and studied under Edmond Malinvaud (1974; Carré et al. 1972) but their work has been heavily influenced by the French sociologist Pierre Bourdieu (1977, 1980). Most of this research focuses upon statistical categories that, individually at least, are much less critical to our interpretation of industrial society than unemployment, and the findings are considerably more modest in scope and import than those that Salais and his colleagues reach in their book on unemployment. But together the studies develop the notion that statistical categories ranging from those used by the census to collect data on professional employment to the job evaluation grid in which the French collect wage data, are a social and political creation; they emerge in a definite historical process in response to particular political and economic pressures and once they emerge they affect in important ways the structure of the economic system and its subsequent evolution. Statistical categories are in other words themselves instruments and institutions that are invented and then propagated through "invest-

ments" in the same way that technologies embodied in physical capital are invented and propagated. We cannot say whether we train doctors and nurses separately because they are distinct categories in our occupational statistics or whether doctor and nurse are distinct categories because they are educated and trained through distinct processes and institutions.

Because statistical categories are important, but historically contingent structures, these categories and the processes through which they are generated could explain such critical differences in the nature and direction of the economic system as those that the LEST studies uncovered in France and Germany. American business organizations today will understand this lesson in terms of their attempt to copy what they perceive as the more efficient Japanese organizational forms: The Japanese eschew a whole set of professional categories—ranging from secretaries to accountants, and industrial engineers—that are critical to the way in which Americans do business. But U.S. companies feel unable to abandon these categories: Instead they have been forced to invent functional equivalents to the Japanese organizational forms that retain these categories even as they have sought to imitate Japanese practice (William Ouchi 1981).

The last of the major intellectual currents reflected in *L'invention du chômage* is the "theorie de la regulation" (Michel Aglietta 1976; Robert Boyer 1979, 1986a, 1986b). This theory was developed by a group of economists trained at INSEE in neoclassical economics but with a strong Marxist intellectual background. In many ways, it can be understood as a way of combining a Marxian framework with the basic analytical insights of orthodox economics, although the features of the two schools that the theory tends to highlight are not those

generally attributed to either school in the United States.

From orthodox economics, the Regulation theorists have taken the idea of a coherent, self-regulating economic system. From Marxian economics, they have taken the notion that the economy is embedded in a series of social and institutional structures and that analytical models must explicitly recognize these structures and the political processes through which they are generated and sustained. They have also taken from Marx the idea of a developmental process in which the society passes through a series of distinct economic systems that succeed each other in history. But they have transposed this notion from the metatransition from feudalism through capitalism to socialism, upon which classical Marxism focuses, to a sequence of systems that are encompassed within capitalism itself. One focus of the theory is upon the nature of these systems, each of which it defines in terms of a set of characteristic institutions that together form a self-equilibrating economic system (in the sense that a competitive neoclassical economy is self-equilibrating, although not necessarily of the neoclassical form). These regimes are separated from each other by periods of *crisis*, in which the system loses its self-equilibrating capacity, and in which stability can be restored only by the generation of a new set of social and institutional structures. These crisis periods and the social and institutional regeneration that occurs within them constitute a second focus of the theory. It is in the analysis of these crises that social and political, as opposed to orthodox economic analysis comes into play. Regulation theorists view both the Great Depression and the current period, beginning in the early seventies, as periods of economic crisis. And it is in this sense that Salais et al. argue that unemployment was created in France as

cial construct in the period of the 1930s as part of the process which generated the post-World War II regulatory structure and that that social construct can be altered in the current crisis in order for a new regulatory structure to emerge.

Keyssar is a product of the new labor history, which emanated in England from the work of Edward P. Thompson (1933) and is represented in the United States by David Brody (1980), David Montgomery (1949), Herbert Gutman (1975), and Eugene Genovese (1969, 1976). Most of these people are Marxists like the French labor economists who have been interested in developing the relationship between the economy and social structure, or what orthodox Marxists would call the *base* and the *superstructure*. They thus reject the traditional view that until the revolutionary period when the capitalist system came to an end, the working class plays an essentially passive role in economic history. The central theme of this research is that workers play an important active part in developing their own culture and that that culture then mediates the impact of the system upon their lives.

The interest of the new labor historians in working-class culture can be likened to the interest of the French labor economists in institutions, but the role that labor historians ascribe to culture never goes nearly so far. The historians preserve the orthodox Marxist determinism moving from the base to the superstructure: working-class culture may mediate the impact of the economic base upon workers' lives but the culture cannot "reform" those lives, nor can it transform the economic system itself. The work of the historians thus tends to preclude an independent historical thrust for the economic system. In this respect, it is fundamentally at odds with the findings

of the LEST studies, the INSEE studies of the history of statistical categories, and the theory of regulation, all of which render problematic the very base that the labor historians assume.

But it is probably a mistake to try to understand the difference between these two books and their interpretations of unemployment within the terms of Marxist scholarship alone. In many ways, the differences transcend Marxism and distinguish continental and Anglo-Saxon thought in all domains of social science. Keyssar, despite his Marxian orientation, writes from a Lockean tradition in which there is a natural world, separate from human beings and independent of their actions. One can thus distinguish, at least conceptually, between "true" ideas which are associated with that world and "other" ideas which are the product of human efforts to alter that external reality. His argument is distinguished substantively by the fact that he works from a Marxist model of capitalist reality in which "unemployment" is a real category. But it is structurally not so different from the Chicago notion of a "natural" rate of unemployment, something which, as the term implies, is beyond the reach of human action. In the continental tradition of social thought, this notion of an external reality is problematic.

The distinguishing cast of recent Anglo-Saxon thought in this regard is illustrated by the evolving debate about the relative stability of the U.S. economy in the post-World War II period. The old orthodoxy in which the postwar view of unemployment was embedded held that the institutional reforms of the depression and the emergence of Keynesian-based demand management after the war had significantly reduced instability. In the new orthodoxy, these claims are highly suspect. They are nonetheless difficult to evaluate because most postwar statistical series are not comparable to

their prewar counterparts. In particular, postwar series are based upon much more comprehensive surveys. This should reduce random variance, or noise, and that alone could make for the greater stability we observe.

A new page in this debate has been opened recently by Romer (1986a, 1986b, 1986c). Her work is based on the insight that although it is not possible to go back in history and collect prewar statistics to conform to postwar standards, it is possible to edit postwar data so that they are essentially comparable to those of the earlier period. The results of this exercise tend to confirm that a good deal of the observed stability in the postwar period is spurious. These results have been interpreted as supporting the view that the fundamental economic processes were unaffected by the postwar reforms, and thus have greatly intensified the debate about Keynesian countercyclical policy. The renewed debate, however, has focused almost entirely upon the accuracy of Romer's corrections of the postwar series (Stanley Lebergott 1986; David Weir 1986). But these series were introduced to support the more active policies that Keynesian economists sought to pursue and are really part of the same package of institutional reforms as the policies themselves. Romer's work raises therefore, not only a statistical question but also a profound theoretical question as well: How is it possible to change so fundamentally the institutions that serve as the eyes and ears through which we experience economic activity without significantly changing the way in which we behave? Or, to put the matter differently, why are our data-gathering institutions so much more malleable than those that produce and distribute goods and services? Indeed, is it really plausible that we could have succeeded so easily in changing the one after the end of the war and yet fail, despite much more

determined efforts, in changing other institutional structures in the same period? These are the questions the French scholars would naturally ask.

#### IV

The difference between the Keyssar and Salais interpretations of unemployment can probably not, however, be understood exclusively in terms of the intellectual traditions in which they are working. To some extent, they are examining two different realities. For one thing, the book focus upon different sectors of the economy in different historical periods. The Keyssar study is of the advanced industrial sector of a much larger national economy in a relatively early period of industrial history. Salais and his colleagues examine the whole of an economy whose industrial spurt occurred much later, at a very different moment in the evolution of the world economic system. To evaluate these influences, given the material provided by these two books, almost requires the reader to take a position on the arguments outlined in the previous section.

The orthodox Marxist position is that the inevitable thrust of industrial development is toward productive units which are increasingly large, employing progressively less skilled labor in more and more narrowly defined jobs, performed in factories whose physical and social existence is increasingly remote from other aspects of social life. Under this supposition, the large productive enterprises and urban conglomerates that Salais and company found to be associated with unemployment are the avant garde of industrial development in twentieth-century France. And Massachusetts, as the most industrialized sector of one of the pioneer industrial economies, is likely to have developed these characteristics in the course of the nineteenth century, as

Keyssar's study shows. Indeed, in this view, French postwar policy, in imposing this model on the national economy, was simply serving as the vehicle for the expression of the forces of capitalist economic development. This conception of the nature of industrial development was very widely shared in postwar France—across the political spectrum—and was one of the major factors in state policy.

On the other hand, when these studies are read against the background of contemporary institutional research on unemployment, one arrives at a somewhat different position about the two studies. The LEST study of France and Germany suggests that perhaps France and the United States were developing fundamentally different employment systems that were basically independent of their technological development. The plausibility of this hypothesis is strengthened by the concern in the last several years with labor market flexibility in the U.S. and Western Europe. The research that has responded to that concern suggests that the American employment system is distinguished not only from the French system but also from that of most other industrial economies by the degree to which employers are free to lay off and discharge workers in response to variations in economic conditions (Piore 1986b).

One would be unlikely to arrive at this conclusion from these two books alone, but if one comes to them with such an idea about the difference between American and European institutions already well formulated, the books begin to suggest how that difference emerged. And one sees it in both the large enterprises to which Salais et al. link modern notions of unemployment, and in the smaller ones, to which they see modern unemployment as initially foreign.

The picture that emerges from the comparison of the history of unemploy-

ment in France and the U.S. is thus different from the one that Salais et al. abstract from French history taken in isolation. Even the large enterprises in France, it becomes apparent, operated on a familial model: They tried to reproduce a social structure within the enterprise that was analogous to that of the household, the workshop, or the farm. That structure involved an obligation of permanent, continuing employment. It has been only when companies are unable to fulfill these obligations, as was the case in the Great Depression of the 1930s, that open unemployment appeared. In other periods France, even in areas dominated by large companies, has had virtually no open unemployment at all.

Keyssar identifies a similar development in early nineteenth-century Massachusetts. The most prominent example is well known: the recruitment of young women for textile employment into factories that combined industrial work with educational and cultural activities in a college campus-like environment. These efforts were abandoned, however, in the course of the nineteenth century for a much more casual employment commitment. Moreover, that move toward a casual employment relationship does not appear to have been peculiar to relatively large enterprises. It seems to pervade the whole of the Massachusetts labor market. Perhaps most striking is the fact that the kinds of mutual aid societies among craftsmen that Keyssar describes in Massachusetts were much too weak to provoke the debate so salient among French statisticians about whether or not out-of-work craftsmen should be classified as unemployed. The critical factor in this development of a casual labor market in the story which Keyssar tells was large-scale foreign immigration. The suggestion that immigration is the critical factor in the development of the peculiar

casualness of the U.S. employment relationship fits well with the fact that in the 1920s, after free foreign immigration was curtailed, America's industrial employers began to introduce more permanent employment commitments comparable to those in Europe and Japan. But for the depression of the 1930s, which interrupted these experiments in a brutal and definitive way, they might have evolved into a very different institutional structure.

## V

What do these books ultimately suggest for an understanding of unemployment? Either book alone, and certainly the two taken together, should be enough to forestall the emergence of a consensus among economists about the interpretation of unemployment. Keyssar's argument, however, is essentially a reassertion of the standard view dominant in the 1950s and 1960s: Unemployment is real—it is a serious disruption in workers' lives. It is not the result of productive job search or relocation: The location of jobs in nineteenth-century Massachusetts shifts too rapidly for workers to find them. But while workers cannot move fast enough to keep up with the pace of job change, they seem to move too fast to serve as an effective inventory of labor for jobs that have temporarily disappeared. There is in Keyssar, moreover, a strong suggestion—although the evidence is incomplete—that the world has changed little in these respects since the beginning of the twentieth century. This suggestion feeds the growing scepticism about the effectiveness of Keynesian demand management. Without demand management, or the prospect of a Marxian revolution, the differences between older views about unemployment and newer ones lose much of their force. Keyssar's analysis suggests a

good deal of moral indignation, which the position originating in Chicago lacks, but it implies a similar resignation.

Salais and his colleagues suggest a fundamental revision of the traditional interpretation of unemployment, one that recognizes and validates many of the insights of recent scholarship, but that leads to very different conclusions. The French argument rejects the premise of mainstream economics, that economic behavior can be usefully modeled by abstracting from the social context in which it occurs. Instead, the argument implies that human beings always attempt to embed their activities in stable social structures. Governmental activities and institutions must be understood as part of those structures (just as, incidentally, must statistical concepts and measures). When government institutions exist, the relevant social structures will be built around them; when they are not present, alternate structures will be created in their place. It is inconceivable, in this view, that such structures will fail to respond to such a fundamental aspect of the human environment as the discontinuity in economic activity or the instability of work, which is reflected in our measures of unemployment.

All of this makes it very doubtful that, under normal circumstances, unemployment is the catastrophic event that Keyssar pictures it to be. When interruptions in work activity are a frequent occurrence, some kind of social structures must be developed to handle it. When that unemployment exhibits a fairly regular seasonal and/or cyclical pattern, those structures must anticipate these patterns and predicate responses upon their existence. This suggests a distinction between normal periods, when the unemployment experienced is anticipated and the social structures that respond to it are stable, and abnormal periods (or, to use the language of the French *théorie*

*de la régulation*, "crises"), when the nature and extent of unemployment are unanticipated and the social structures with which people have traditionally accommodated that unemployment break down.

In this perspective, the depression of the 1930s was a critical moment, at least in the U.S. and in France. But it had two separate and distinct effects. First, it was a crisis in the above sense of the term. The existing social structures were unable to accommodate the unemployment of the depression and the government intervened to supplement them. This first effect was probably an inevitable part of the depression experience. But the second effect was not inevitable. The government might have created only temporary structures designed to handle the crisis but destined to disappear with the economic recovery. Some, like the Works Progress Administration in the U.S., were eliminated. But many of the new institutions either became permanent or were replaced by permanent institutions of similar design. As a stable social structure was regenerated in the postwar period, it presumed those new types of governmental institutions and was built around them.

This undoubtedly changed the statistical manifestations of unemployment and the response of the workforce to it. But the nature of this effect is not obvious. For example, government unemployment insurance might prolong the job search and inhibit labor mobility. But if it substitutes for more local systems of support such as the family or craft mutual aid societies, it could just as well increase labor mobility. The unemployed could well have been relieved by the new system from pressure to stay close to family support networks, reject job offers that undermine the family's social status, or remain in the craft from which they draw their aid. Thus, to know what the impact

of the unemployment insurance systems has been, one would have to examine in detail the nature of the social system which it replaced. And to evaluate proposed reforms, now, one would have to anticipate the social support networks that will arise in their absence.

The most important point suggested by the Salais argument, however, is that whatever the relevance of the arguments about unemployment as an artifact, they seem almost completely confined to periods of "normal" unemployment, not periods of "crisis." And the current period appears most appropriately characterized as one of "crisis." It is a crisis in the sense that the extent and magnitude of the unemployment we are experiencing was not anticipated either by the labor market participants or by government policy-makers.

In the United States and Western Europe it is clearly straining systems of social support, both public and private, forcing them toward bankruptcy. This effect is less apparent now than in the 1930s because few of the unemployed have actually been denied some form of social assistance. But unemployment insurance systems in both countries would not have been able to provide this assistance had they not been supplied with general revenue. In France, employers who never laid off were forced to do so. In the U.S., too, employers have laid off managerial workers who had been previously thought to have permanent jobs, and even for blue-collar jobs never considered permanent the magnitude of the layoffs has required the ad hoc renegotiation of collective agreements, in some cases more than once. The issue today is, as it was in the 1930s: What kind of new social systems will we create to replace the structures that are falling apart?

Here a final insight of the French research becomes important: The social

structures that mediate the impact of economic flux and uncertainty upon our lives—and hence determine whether or not these manifest themselves as unemployment—are not freestanding. They are part of much broader constellations of practices, institutions, and relationships. They cannot be understood independently of managerial philosophy and technique, the way in which economic and family relationships are intertwined (or separated), the size and structure of enterprises and the relationship between them, and—following the logic of the LEST comparison of France and Germany—the educational system, industrial relations, and the structure and organization of productive forces themselves. Because these things are bound up together, unemployment cannot be meaningfully evaluated in isolation. Both scholarship and policy must focus instead on these much broader constellations, on the nature of their internal coherence, on their origin, and on the way in which they evolve—or can be made to evolve—in time.

This way of looking at the world, and the research agenda that it implies, is not quite as distant from that of mainstream economics as it sounds. One branch of contemporary theory is increasingly focused upon the phenomenon of long-term contracts that govern economic relationships over a range of contingent events. One could think of such long-term contracts as institutions, and one could understand a "regulatory regime" as an interdependent constellation of such contracts—interdependent in the sense that the validity of the distribution of contingencies assumed by any one such contract depends on the actions mandated by other contracts in the same constellation. A crisis of a regulatory system defined in this way can then be thought of as occasioned by the fact that the parties come to doubt the validity

of the distribution of contingencies that the institutions presume. The resolution of such a crisis would be seen as a process in which the contracting parties come to believe in an alternative distribution and build new contractual relationships on that basis.

To the extent that the current crisis revolves around unemployment it can be given quite precise meaning in these terms. The institutions sustaining the unemployed, in both the United States and Western Europe, have been designed to be self-supporting insurance systems. Their financial structures thus explicitly embody a set of assumptions about the distributions of unemployment levels over time. The fact that these systems are threatened with bankruptcy means that the actual levels of unemployment lie outside the assumed distribution. This fact is in turn attributable to the failure of assumptions upon which the structure of employing institutions are built, assumptions about the distribution of the levels of product demand upon which the practices of individual enterprises in employment and lay-off are predicated.

Phrased in this way, a theory of long-term contracts would be precisely the theory of regulation that Salais and his colleagues are attempting to develop. But it is here in fact that the real difference between mainstream economics and the approaches of the theory of regulation emerges most clearly. Mainstream theory has been attempting to understand the nature of long-term contracts and the process through which they are generated by focusing on two classes of problems: one in which the underlying distribution of contingent events is known and the other in which stable belief structures about the nature of that distribution can be generated by the interaction of the contracting parties (Robert Anderson 1985).

There are inherent difficulties with this

approach. These include the fact that logically no series of events will necessarily lead one to abandon a given set of beliefs about the distribution of events like the level of unemployment: The occurrence of any particular level of unemployment could simply be attributed to an extremely unlucky roll of the dice. Even a very long string of high levels might be interpreted as an exceptional run of bad luck, a range of experience so unlikely to recur that one would not want to design an institutional structure to accommodate it. This was more or less the rationale for financing the expenses of unemployment throughout the seventies through "loans" to the unemployment insurance system from general government revenue without a basic revision in the tax and benefit structures. When one is led by events to abandon the old beliefs about the underlying distribution a further problem emerges. Given the number of interrelated contracts and hence the number of different belief systems at stake in a modern economy, it seems very unlikely that a stable set will ever be generated by discrete interactions of the kind on which mainstream theory is focusing. If this is so, then belief systems must be imposed in some other way. The other way might be through some kind of social contract, through a political compromise engineered by a coherent ruling class, or a sociocultural process through which some limited set of institutional structures is given salience.

It is a concern with these alternatives that distinguishes the research agenda of the French school and of those of us in the Anglo-Saxon world who share, in one way or another, its perspective. Understood in this way, the relevant literature is not necessarily that on unemployment per se; it is the literature that tries to understand the broader institutional structures of which unemployment is a by-product. In the U.S., work along

these lines includes the studies of Harry Katz (1985) and Tom Kochan et al. (1986) in industrial relations, Paul Osterman's work on employment and training systems (forthcoming), Mel Horwitch's work on what he calls "post-modern management" (forthcoming), Ouchi's study of the ways in which American management has sought to adapt Japanese business practice (1981), and Piore and Charles Sabel's book about the evolution from mass production toward flexible specialization (1984). The popular press, and indeed much of the community of academic economists (Norton 1986), has assimilated this work to the debate about industrial policy. But in fact it should really be understood as cousin to the French school. The basic research strategy is the "levered" case study. Its essence is to use the variation in institutional arrangements across industries, countries, and historical periods to enlarge the repertoire of arrangements that we know to be possible; to use the contrast between those possibilities and the arrangements that are actually realized in a given industry at a particular time and place to suggest the operative constraints; and finally to seek to envisage ways of circumventing those constraints by combining the arrangements drawn from the enlarged repertoire in novel ways. *L'invention du chômage* provides us with a model of how to approach one particular policy problem in this way.

## BOOK REVIEWS

### General Economics; Theory; History; Systems

#### 010 GENERAL ECONOMICS

*The laureates: Seven Nobel economists.*  
Edited by WILLIAM BREIT AND ROGER W. SPENCER. Cambridge: MIT Press, 1986. Pp. 35. \$13.95. ISBN 0-262-02255-9.

JEL 87-0004

"I don't take their word for it!" The advice is common in economic discourse: we economists do not trust the explanations agents give for their actions. We try to relegate the subjective to objective functions and rely on revelation of feelings in choices that can be observed. Thus we repress the personal in discourse.

Effective repression notwithstanding we indulge in speculation about personal life when it comes to the behavior of economists. We like to know what goes on in their lives, which particulars account for their ideas, why they got to be good (or bad). That is why a small volume with lectures of seven Nobel winners about themselves will be in demand.

William Breit organized the lecture series and provided the material. He invited, in order of appearance, Arthur Lewis, Lawrence Klein, Paul Arrow, Paul Samuelson, Milton Friedman, George Stigler, and James Tobin to prepare "personal memoir under the general rubric 'My Evolution as an Economist'." The connection with an American university at the time of the award and the principle of variety guided their selection. (In 1983, the year of the lecture series, there were eleven economists who met the first criterion.)

The larger purpose was, Breit and Spencer write in their introduction, "to provide important source material for a theory of scientific discovery." The Nobel laureates themselves, however, are unsure whether they have much to contribute to that purpose. Samuelson hints

at the messiness of the process of discovery: too many ideas crowd his research diary with too many cross-references to allow the construction of a causal story. Stigler champions the view that "a knowledge of the life of a scholar is more often a source of misunderstanding than of enlightenment about his work." He does not attach much value to the role of the environment in the genesis of economic ideas. Arrow downplays his biographical statements because he does not believe that personality matters much in science. Contrasted with these explicit disclaimers, Klein's is implicit as he keeps personal detail to a bare minimum. (The computer plays a critical role in his story.)

Admittedly, they all tell us about people who influenced them, reconstruct the progression of their ideas, and remind us of the intriguing phenomenon of simultaneous discoveries (see especially Arrow's lecture). But to get insight into the process of discovery we want to go beyond the brief autobiographical statements, and grill them or, if we would like theoretical insight, ask Herbert Simon who is not only a Nobel prize winner himself but has also dedicated his latest intellectual efforts to this very subject.

Nevertheless, these lectures tell us a lot of other things. They tell us tidbits about the lives of the authors, maybe not enough to justify the title of the book but sufficient to satisfy our need for personal details. Important information is also in the ways of story telling. One of the authors told the editors: "I do not know that I could keep it between the Scylla of false modesty and the Charybdis of boastfulness . . ." *Le style est l'homme*; the remark betrays Samuelson who in his lecture portrays himself as the virtuoso who achieves highest honors with minimal pain and maximal pleasure baffling anyone who ventures to watch. Such words do not come from Tobin who meditates in his story between assertiveness and modesty or Klein who narrates his in a matter of fact manner.

ner—but not without making sure that credit comes where credit is due. Remarkable is Lewis' account. He makes us first of all realize that being black in the world of economists does make a difference. And then he tells a story in which fortune has the better part with him as the unwilling participant who nevertheless repeatedly generates controversy with his ideas. Such a story, which is almost an apology for his being where he is, forms a stark contrast with the one by Friedman or by Samuelson. Friedman also gives credit to chance in his story but claims his stage without self-consciousness and reservation; the latter sees himself so much the orchestrator of his own story that he chooses to tell it in the third person.

Yet even if one is not interested in the self-images that these Nobel Prize winners portray, one may find much of interest in the image that they collectively paint of their time and generation. We recognize a generation who started careers in economics with great enthusiasm. All these economists, now in their late sixties and seventies, were excited about the possibilities of mathematics and statistics in economics while admiring people such as Hotelling, Wald and Von Neumann. Keynes provided them with substance for argument, but the mathematicians gave them their self-image as scientists. We realize also through their stories that economics was getting made in the USA. England plays only a minor role; the central locations are places such as Harvard, Chicago and Columbia.

Accordingly, slim as this book may be, it is rich in content. It is recommended to anyone who is interested in knowing how we got where we are now.

ARJO KLAMER

University of Iowa

*Human desire and economic satisfaction: Essays on the frontiers of economics.* By TIBOR SCITOVSKY. New York: New York University Press, 1986. Pp. xii, 209. \$45.00. ISBN 0-8147-7862-3. JEL 87-0349

"Nothing is ever so simple," says Tibor Scitovsky at the end of one of the 14 essays in this charming book, "that a single explanation will adequately explain it." That he views the world as complex is evident from his approach here to the age-old question of why some peo-

ple are happier than others. The explanation in standard neoclassical economics fails, he reminds us, to illuminate why self-ratings of happiness tend to be unresponsive to economic growth. His own thesis goes a long way toward illuminating this particular finding. But true to his dictum, he refrains from claiming that the issue can now be laid to rest.

Scitovsky accepts the neoclassical assumption that the individual endeavors to maximize utility. He is understandably disturbed, however, by the lack of attention within neoclassical economics to the sources of utility. To determine how well a person is using the opportunities he is presented, we must identify his needs, suggests Scitovsky, and then determine how he resolves the conflicts these inevitably generate. Neoclassical economics has shied away from this task, and so, it has disqualified itself from a policy role on diverse matters central to the human experience.

In Scitovsky's own framework, there are two sources of utility: comfort and stimulus. The former depends on the level of output, the latter on changes in its level and characteristics. The introduction of a new appliance generates lasting comfort. It also generates some excitement, which soon wears off, though, leaving a void to be filled by a new stimulus. In general, this could take the form of a challenge to one's skill, strength, or intellectual ability, or else a threat to one's life, health, economic welfare, status, or self-respect. A claim that runs through all the essays is that modern progress has blocked some of the main avenues of excitement: much work has become routinized, and both physical dangers and economic insecurity have diminished. These developments, Scitovsky observes, have induced people to look for excitement elsewhere: dangerous sports, games of chance, exotic travel, do-it-yourself tasks, political agitation, and various forms of crime.

But, he further observes, these activities have not quenched people's desire for excitement, for the demands of work leave little time for their pursuit. Herein lies his explanation for the finding that people's self-ratings of happiness have been stable in the face of the unprecedented economic growth of recent decades: in the process of increasing people's comfort, this growth has left them with an excitement deficit. This explanation does not con-

fict with the evidence that at any time and in any society high-income individuals tend to have higher self-ratings than low-income individuals. High-income groups contain a greater-than-average proportion of people whose jobs are relatively stimulating or whose incomes have recently risen.

What could be done to close the excitement deficit that progress has borne? Scitovsky puts emphasis on teaching people how to generate more excitement from the leisure time at their disposal—on developing, that is, their consumption skills. This could be done by reorienting school curricula toward the humanities and by subsidizing programs for the young. Such measures, predicts Scitovsky, would lead to a fall in crime: people who, because their consumption skills are underdeveloped, now seek excitement from violence would turn to painting, literature, and theater.

This is a bold argument that touches on issues of fundamental importance. Coming from an eminent economist with an impressive knowledge of psychology, it deserves to be taken seriously. It does, I hasten to add, have a glaring limitation, which is that it devotes little attention to the social determinants of personal excitement. The stimulation a person derives from a play comes partly from his subsequent critical and recreational talks about it with others. So the fewer of his acquaintances see the play, the less opportunity there is for stimulation. The task of providing people with enough excitement is thus a social coordination problem. If lots of people attend plays, then the individual who attends will find the experience sufficiently stimulating to justify his time and expense. But if few people attend, he will find the stimulation insufficient, and in accordance with Scitovsky's theory, he will seek stimulation elsewhere.

Given that the latter condition characterizes modern society in general and American society in particular, what can be done to establish a superior coordination equilibrium? Scitovsky does not address this question directly. But from several of his essays it is apparent that his solution would involve the abandonment of permissive child raising. Parents and teachers, he asserts, currently give their children and students far too much freedom in choosing courses and in allocating time after school. But

children are incapable of making wise choices in these areas, because they know little about their future needs. Left to their own devices, they naturally favor the momentary thrill of video game to the painstaking process of learning to play the piano. It is essential to children's future happiness, Scitovsky believes, for parents and teachers to reclaim the authority that they have surrendered.

There is nothing novel about this prescription. Scores of social commentators have advanced it forcefully, including the historian Christopher Lasch and the psychologist Christopher Badcock. What is remarkable about this version is that it has been developed by a respected economist in choice-theoretic terms. Textbook economics teaches us that less choice cannot lead to more happiness. Scitovsky has added one more chink to the armor of this principle, already dented by developments in the fields of public choice, games, and institutions.

Other issues that receive attention in the book include the measurement of inequality, the benefits of monopoly and monopsony, and the dynamics of capitalism. On the last issue, he argues that capitalism is becoming increasingly calcified, as bureaucratization, expansion of government, and growth in the size of firms reduce the responsiveness of buyers and sellers to market signals. Characteristically, he refrains from predicting the demise of capitalism, pinning his hopes on the emergence of a new idea that will pave the way for the recovery of lost flexibilities.

Neither individually nor collectively do the essays present a fully developed argument. Scores of theoretical claims fall out of thin air, and only some of the empirical assertions are backed up by systematic evidence. The book is ruminative, discursive, and in many respects, merely suggestive.

This is no complaint, for Scitovsky's aim in these essays is simply to introduce various concepts and models and to encourage empiricists and theorists to carry them off in new directions. I think that many economists and other social scientists will find the book both enjoyable and profitable to read. It is loaded with interesting ideas, and it sheds light on some puzzling phenomena. In addition, it is written in an easy and unintimidating manner, with

no attempt to complicate intuitively simple propositions through cumbersome notation or terminology.

020 GENERAL ECONOMIC THEORY

*Benefit, cost, and beyond: The political economy of benefit-cost analysis.* By JAMES T. CAMPEN. Cambridge, MA: Harper and Row, Ballinger, 1986. Pp. xii, 240. \$29.95. ISBN 0-88730-106-1. JEL 87-0018

The book is an attempt by a radical political economist to argue that benefit-cost analysis (BCA) is a conscious exercise to strengthen monopoly capitalism. However, previous to asserting this he rejects the view that BCA is biased toward either a liberal or conservative perspective. Reading the book I was saddened to see how ideology could totally dominate over fact. It gave me an uncomfortable feeling that, possibly, bourgeois economists, who rely too heavily on theory without fact to support their policy prescriptions, may be faulted as well.

The book has four parts: 1) an introductory description of benefit-cost analysis, 2) a weighing of arguments that BCA is either liberal or conservative, 3) a major section that argues that BCA's development "was promoted and shaped by capitalist efforts in pursuit of their class interests in accumulation and reproduction" (p. 184), and 4) a short final section that presents the author's vision of a socialist world and of how BCA can be part of the transition to socialism.

The author's description of BCA is adequate enough to characterize its general nature, but not sufficient to instruct one in how to do a study. In Part II he presents a liberal indictment, a defense, and then a summing up. The author summarizes the criticisms of BCA, which are all familiar, although he claims that he does not know of any place where they have all been brought together. The bottom line of his evaluation is that BCA should have the support of liberals since its thrust is to "curtail weak claims rather than weak clients" (p. 95). This section concludes with familiar caveats such as, Do not rely on BCA when the problem is too intractable for our known measurement techniques and, be alert to politically distorted applications. One can argue with some specific

points in the analysis, but on the whole it is reasonably done. It is the last half of the book that reaches for originality, deals with the radical criticism of BCA and, here, almost every page gives rise to wonderment.

The author's "radical" thesis is that:

Under the guise of promoting the public interest, individuals and institutions representing the most class-conscious elements of the capitalist class played a dominant role in shaping and implementing BCA during the period between World War II and 1970. (p. 122)

Therefore BCA will contribute to choices that serve the general class interest of the capitalists. His proof is dependent upon such strained arguments as the linking of the Reform movement at the turn of the century with BCA. First he cites radical historians to prove that the Reform movement was to serve the interests of capitalists and was profoundly antidemocratic since it made extensive reliance on "experts." Then he links the reformist Institute of Government Research headed by Robert Brookings to the Brookings Institution's publication of Robert Dorfman's *Measuring Benefits of Government Investments* (Washington, DC: Brookings Institution, 1965). This historical continuity is buttressed with a charge that BCA is an instrument by which the expert seeks to bypass the inputs of the "people."

He completely misunderstands the spirit and intent of the founders and later implementers. He charges that BCA by use of experts frustrates democratic checks. However, the objective of benefit-cost analysts has been to constrain the "expert bureaucrats." The bureaucrat technicians are the group that had already frustrated the "democratic" order. Rand's interest in BCA was not to perpetuate capitalist institutions but to establish civilian, and thereby political, control over the military bureaucracy. Experts who had confused their professional criteria and bureaucratic payoffs with the national interests were the target of BCA. Furthermore, the technical argument of BCA is more meaningful to the "people" than the more abstruse bureaucratic reports presented by soldiers, doctors, engineers, psychologists, and similar professionals.

The author insists that benefit-cost analysts accept institutions, and thereby the current power structure. It is true that they usually

are consultants to someone and therefore cannot wander far from the authority of their principal. However, BCA has often gone far afield in dealing with institutional innovation. Benefit-cost analysts were quite prepared to propose institutional changes such as flood plain zoning instead of engineering works, or a volunteer army instead of conscripts. However, so far as I know, no responsible analyst who had to deal with a problem ever threw up his hands and said the only solution was socialism.

Another radical charge is that BCA ignores the process of production and focuses only on consumption. This is charged despite the efforts of analysts to find benefits for family-sized farms, or the choice of job-training programs, or any number of other studies dealing with the supply side. Campen is correct in saying that usually little weight is given to the production side in many studies since it is often the beneficiaries of the contracts to be let who raise specious arguments in favor of the special values of suppliers. And it is the economist who has had to represent the social welfare against the "special interests." However, when supply factors are relevant the analyst does deal with them.

After going through the radical indictment, only samples of which are discussed above, Campen completely reverses himself and says that BCA can be an agent of radical social change and of assistance to socialist planning. This turnabout is presented as a confirmation of his "radical analysis" since he has now found a "contradiction," not in his analysis, but in "capitalism." In the ideological indictment BCA is made nonparticipatory, elitist, protective of capitalist interest and ideology, but in the chapter of contradictions, we are told that all sides in a controversial issue use BCA and that the basic ideas of BCA about social rather than private benefits and costs subvert support for the capitalist market economy! Possibly this is good dialectics but it is bad analysis.

To summarize: there are several much better descriptions of benefit-cost analysis in other books; I could not find any merit to Campen's radical critique of BCA. Students might be given some of the chapters to test their critical abilities.

JULIUS MARGOLIS

*University of California, Irvine*

*The theory of externalities, public goods, and club goods.* By RICHARD CORNES AND TODD SANDLER. Cambridge, New York and Sydney: Cambridge University Press, 1986. Pp. xii, 303. \$34.50, cloth; \$12.95, paper. ISBN 0-521-30184-X. JEL 87-0019

This book, intentionally more narrow than a typical textbook but less technical than a work for specialists, is good at what it does, but has a difficult time finding its niche. Its intent is to "provide a more extended discussion of the theory and policy implications of externalities, with particular emphasis on those special cases represented by public goods and club goods" and is intended to be useful for "well-prepared undergraduates," graduate students, and economists "wanting to find out what some of their colleagues in public economics have been up to" (p. xi). The minimum required background is a good understanding of intermediate microeconomics and basic calculus, particularly constrained maximization.

There are five parts: an introduction, one part each on externalities, public goods, and club goods, and a section entitled "Applications and Future Directions." The introduction consists of two chapters surveying the basic concepts and tools of analysis. The section on externalities is also brief, consisting of two chapters that explain why the presence of externalities causes difficulties for the two Fundamental Theorems of Welfare Economics, show some of the relationships between externalities and other concepts like incomplete markets and transactions costs, and describe Pigouvian taxes.

The section on public goods is much longer and generally more substantive. Chapter 5 contains a detailed examination of a Bergstrom, Blume, and Varian (1986) type model of private provision of a public good. The authors characterize the extent of the deviation between the Nash equilibrium outcome and Pareto optimality and discuss how this depends on various factors such as the size of the population. In Chapter 6, they turn to mechanisms that achieve Pareto optimality such as the notion of Lindahl equilibrium and Clarke taxes. This chapter is unduly brief and rather dated. Chapter 7 extends the basic model of Chapter 5 to consider more general assumptions on the public good. Chapter 8 considers several models

that are more explicitly game-theoretic, including a cooperative game-theoretic approach and binary choice models. The last chapter of the section is entitled "Departures from Nash-Cournot Behavior" and consists primarily of a conjectural variations approach to the model of Chapter 5.

Part IV, on club goods, is better still. It consists of six chapters that first give an overview of the club theory approach and then turn to a variety of models in this tradition. An almost bewildering array of formulations is considered, including a cooperative game-theoretic approach, various forms of uncertainty, and intergenerational clubs. The authors generally succeed in keeping the "big picture" in the reader's mind, a challenging task here. The final section of the book provides some discussion of empirical work and applications of the models, a summary of the book, and some directions which the authors consider especially important for future research.

The book has a number of good points. The references, though slightly dated due to publishing lags, are very complete for the areas covered and likely to be useful to researchers. Also, I suspect the book would be quite useful for graduate students in a public finance course. The periodic overviews Cornes and Sandler provide should help students to gain some perspective on the field and on topics within it. The models focused on are generally well-chosen for pedagogical purposes and do a good job of illustrating the key points without undue complexities. This is particularly true of the section on public goods.

Unfortunately, like most books, this one has its drawbacks. First, its intentionally narrow focus means that most people would not wish to use it as a textbook without some supplement. It gives little attention to a number of topics often considered in graduate public economics courses, such as public choice and empirical work. Second, even within the area the authors wish to explore, there are some important omissions. The most glaring of these is the unduly cursory treatment of mechanism design or implementation theory. A large body of theoretical literature on ways to deal with precisely the problems the authors emphasize should not be dismissed with an explanation of Clarke taxes and a brief discussion of the problems of non-uniqueness of equilibrium. More generally, the

treatment of game theory throughout the book is solidly in the tradition of viewing Nash equilibrium as a surrogate "stable point" of a dynamic process, possibly with incomplete information. For example, the authors describe a Nash equilibrium in a two-person game where strategies are public good contributions by saying "equilibrium is based on . . . maximizing behavior subject to a quantity constraint reflecting the other agent's *previous* public good contribution" (p. 19, emphasis added). At another point, they argue "Since the whole context of the game presupposes incomplete information, one cannot jump straight to the Nash equilibrium" (p. 144). It would be inappropriate for me to dwell at length on criticisms of this view. Suffice it to say, those who prefer their game theory "straight up" should be warned that they will find parts of this book hard to swallow.

To summarize, I suspect that the best niche for this book is as a (carefully used) text in a graduate or advanced undergraduate course or as a reference book. As such, I think it will serve its purpose well.

*Macrodynamics: Fluctuations and growth. A study of the economy in equilibrium and disequilibrium.* By PIERRE-YVES HÉNIN. Translation. International Library of Economics series. London and New York: Routledge and Kegan Paul in association with Methuen, NY, [1981] 1986. Pp. x, 455. \$45.00, cloth; \$20.00, paper. ISBN 0-7102-0664-X, pbk.

JEL 87-0023

This book is devoted to an analysis of modern macrodynamics, built around the Keynesian Revolution as the intellectual watershed. Ultimately the author concludes that the changes in thinking which occurred in the 1970s may prove to be as profound as those of the Keynesian era.

This book is divided into four parts. Part I begins with an historical review of the dynamic theories of David Ricardo, Karl Marx, and other pre-Keynesians including Friedrich Hayek and

Joseph Schumpeter. It concludes with a review of Keynes, paying particular attention to the differences between Keynes and Leon Walras. Part II considers behavioral dynamics as reflected in the consumption function, investment decisions, and the role of money. In connection with each the author traces the major developments of the past fifty years showing how post-Keynesian thinking has affected the 1936 Keynesian view of these major aggregate variables. Part III is devoted to growth and begins with an analysis of both its sources and its causes. The author traces the changed perspective, under the influence particularly of Harrod, from statics to dynamics—that is from looking at dynamic theory primarily in terms of cycles as was common in the pre-Keynes era, to the current emphasis in dynamics on assessing the challenges posed by irregular growth rates. Noting that pre-Keynesian thinking fixated on cycles rather than growth, Henin traces the many strands that have contributed to the modern analysis of growth and to assessing questions such as how to determine the optimal growth rate, the costs of growth, the limits to growth, etc. Chapter 8, devoted to the stability and regulation of growth, focuses crucially on the shift from the classical equilibrium paradigms to balanced growth considerations in the post-Harrod world. It is thus a critical link in the consideration of what is involved in getting Harrod's natural and actual growth rates to coincide. Unfortunately the chapter lacks a concluding section, although much of the discussion forms a necessary prerequisite to reaching meaningful conclusions on the possibility for stable growth rates.

Part IV is devoted to short-run instability and in particular focuses on the relationship between inflation and unemployment over the business cycle. It includes a consideration of the changing perceptions of the Phillips curve generally, and in particular examines the differing explanations which have arisen for the increasingly unreliable long-run relationship between inflation and unemployment.

Throughout, the sweep of the approach is very broad indeed. Not only are we exposed to the developments in mainstream thinking on macrodynamic questions from Ricardo through Keynes and the post-Keynesians to the present new classical economists, but the author is careful where possible to include Marxist

thought as well. The book reflects its French past from time to time by relating the discussion to the development of the modern French economy and its current problems.

While many readers, including both students of the history of thought as well as macroeconomists, will find much of interest in this book, in the end it also raises several difficulties. For one thing it is never entirely clear who is the intended audience. If it is the trained professional economist (as one suspects) many explanations would seem to be superfluous or at least overdone. (What is a production function? What is the multiplier?, etc.) On the other hand if it is designed for readers who need these explanations, much of the exposition will almost surely be too difficult to be easily followed. (It is impossible to tell how much of the impression that the text is often difficult to follow is due to the translation and how much to the original French exposition.)

More substantively, the author prejudices current debates about macrodynamics even when it does not appear necessary to do so. He states that Keynes was basically wrong in concluding that a market-oriented system could allocate resources efficiently but could not keep them fully employed and that if we could but find a way to accomplish the latter the former could be reattained as well. He concludes instead that some kind of planning (being French he suggests "indicative planning") will have to be included along with stabilization policies and that the planning will have to include prices, to confront inflation, as well as quantities. No adequate groundwork is laid for these opinions.

There are a few minor difficulties. Occasionally the charts do not appear to have the axes adequately labelled. At times he ignores the straightforward approach for a less familiar or more cumbersome one. For example, he fails to use the terms induced and autonomous investment preferring instead to refer to them as "the two types of investment function we have encountered—the Keynesian function and the accelerator" (p. 115). To take a different sort of example, he suggests that government expenditures in connection with counter-cyclical programs "amount to transitory resources" and so produce a different multiplier effect than would be generated from a change in "permanent income" (p. 92). Empirical investigation

would be more convincing than flat assertion.

If in the end the book's reach exceeds its grasp, it nonetheless is a forthright effort to trace the development of modern macrodynamics, and to assess critically where we stand today in the policy debate which has gripped the field increasingly over at least the past fifteen or so years.

030 HISTORY OF ECONOMIC THOUGHT;  
METHODOLOGY

*A history of modern economic analysis.* By ROGER BACKHOUSE. Oxford and New York: Blackwell, 1986. Pp. xii, 520. \$34.95. ISBN 0-631-14314-9. JEL 86-0360

I do wish that Professor Backhouse had had the chance to read and meditate upon the recent collection by Richard Rorty et al. (1984) before he had embarked upon the task of writing his textbook. In that praiseworthy volume, Rorty describes four genres of the history of thought: broad-beamed intellectual histories written by generalist historians with no stake in any particular intellectual discipline; "rational reconstructions" of the writings of particular authors which try to correct their "mistakes" and highlight their anticipations of modern doctrines; *Geistesgeschichten* which ask why certain questions became central to a particular discipline; and "doxographies." According to Rorty, doxographies are remembrances from syllabi past, half-hearted attempts to tell a story of intellectual progress by describing all canonical texts in terms of recent orthodoxy. To paraphrase him, doxographies are desperate attempts to make Smith and Debreu, Menger and Commons, and Marx and Coase all talk about some common topics, whether the historian or his readers have any interests in the topics or not. Of these four genres, Rorty argues that the first three perform important functions in any intellectual community, but the fourth does not, because its major *raison d'être* seems to be the reinforcement of the prejudices of the present by insulating us from those in the past most likely to give us disquiet.

I should like to report that this *History* avoids the status of doxography; but alas, I cannot. Its major selling point and distinguishing char-

acteristic amongst history textbooks is that the entire pre-1870 pre-neoclassical body of economics is summarily written off in 50-odd pages, whereas 200 pages are devoted to the period 1870-1939, and 140 pages to the modern period. This must have taken some bravado, since more often than not in courses in the history of thought, the spirit is willing but the flesh is weak, and one rarely makes it into the 20th century before final exams. This book also has some other unusual features, such as two separate chapters on "Economics and Policy in Britain," two chapters on "Scope and Method," and two chapters lumping together a most extraordinarily motley crew under the rubric of "Alternative Approaches." There also are the now-obligatory bows in the direction of Popper, Kuhn and Lakatos. Yet the single most insistent message of this book is not novel in the least. One learns over and over that there has been a long line of fellows (no women allowed except Joan Robinson, and of course, she will not count) who, had they only gone that extra mile, would have stumbled upon the entire corpus of modern neoclassical economics.

Rorty correctly points out that stories like these resemble stories about people who would have discovered America had they but sailed a little further: an anthology of such stories is not a *history* of anything. A costly assemblage of names and dates to memorize and obeisances paid will prove to be few peoples' cup of tea. To see why this should be so, let us provisionally adopt Backhouse's positions that "an important reason for the survival of mainstream economics was that some criticisms were answered very effectively" (p. 239), that modern neoclassical theory is a "progressive research programme" (p. 412), and that "the development of economic theory is to a substantial extent autonomous" (p. 258). Now, if all this were true, then why would anyone be interested in a litany of half-baked and half-correct ideas which either led to (a) today's superior neoclassical theory; or (b) unorthodox dead-ends? After all, consider the physicists: they do not permit the history of physics to be included in their curriculum. This lesson has not been lost on the top graduate research programs in economics in the U.S. of the last two or three decades.

From this vantage point, the intellectual history of a discipline and the philosophical litera-

ture attached to it share the same taint. Introspection and self-examination are regarded as betraying a sort of metaphysical loss of nerve. I believe it is this latter conviction that explains the ritual homage paid to Popper and Lakatos in economics. In this *History*, the student is not acquainted with the hair-raising problems of the underdetermination of theories by data, the incommensurability of rival research programs, or the role of rhetoric in sustaining practice in the face of adversity, all problems which gave rise to that literature in the first place. Instead, the student is given a smattering of "methodology" in order to foster the impression that Popper and Lakatos describe physics, Popper and Lakatos can be applied to economics, ergo (unstated) economics is also a science.

The genre of history represented here is ultimately self-defeating, because its principles render it unsuitable for the serious study of the history of economic thought: "External" influences do not count, so there is no need to waste time on them. Anyone not an orthodox neoclassical economist was fundamentally misguided, so there is no need to expend the effort to get their systems right. Indeed, so insignificant are the unorthodox that those sections (including the obligatory one on the old bete noire himself, Marx) are written almost exclusively from secondary sources. Even the heroes of the narrative, the protagonists of the marginalist revolution, are so badly folded, spindled and mutilated that one cannot tell them apart (Mirowski 1987). Worst of all, this *History* is written as if from some detached Olympian height, without the emotional light and heat of the best histories, be they pro- or anti-neoclassical. At least "rational reconstructions" want to argue with famous dead economists, while *Geistesgeschichten* want to sweep the stables clean and reorganize the pantheon. Doxologies just lull the audience to sleep.

- The history of statistics: The measurement of uncertainty before 1900*. By STEPHEN M. STIGLER. Cambridge, MA and London: Harvard University Press, Belknap Press, 1986. Pp. xvi, 410. \$25.00. ISBN 0-674-40340-1. JEL 87-0040
- This is a delightful book. It is a beautifully written account of the development of statistics, from the probability theory of Jacob Bernoulli, and the struggle with measurement errors by the early astronomers, to the regression and correlation analysis of Francis Galton, Karl Pearson, Francis Y. Edgeworth, and George Udny Yule. Professor Stigler gives us broad vision and meticulous scholarship. He has examined original sources, publications, and correspondence. He takes us into the central details of the problems that gave rise to statistical methods, be they about the motions of the moon and planets, the shape of the earth, the measurement of population, the conviction rate in the French courts, the heights of military conscripts, human ability to assess which of two objects is heavier, or the sizes of successive generations of sweet peas. He shows us the data that were used, and the calculations made from them, warts and all. He gives the mathematical derivations that were central to the development of statistics. Much of his story can be richly enjoyed by statistical novices, but the technical passages use probability theory and differential and integral calculus just as the founders did.
- The book is beautifully produced. It displays some three dozen reproductions of historic pages of publications and notes by the giants of statistics, and some dozen of their portraits.
- The first part of the book deals with the development of statistics for astronomy and geodesy in the hundred-odd years ending with the death of Pierre Simon Laplace in 1827. Here the practical scientific problem was the "combination of observations": how to proceed when there are conflicting observations of a physical phenomenon. The principle of least squares, first published by Adrien Marie Legendre in 1805, became the accepted method. This part of the book culminates in Stigler's account of the "first great synthesis" of 19th century statistics, by Laplace and Carl Friedrich Gauss, relating least

squares to the theory of probability and the normal distribution.

The remaining two thirds of the book is devoted to the slow spread of statistics to the social sciences, and to the transformation wrought by the theory of regression. Stigler argues that probability theory could not be applied to social data unless one could either (a) be certain that the data were homogeneous, that is, were measurements of an invariant phenomenon such as the motion of the moon or the shape of the earth, so that the theory of errors could explain all the variation, or (b) devise a method of dealing with their heterogeneity, by holding constant the factors causing it. He explains why (a) was a failure in social science, while giving a lively account of Adolphe Quetelet's attempt to create a "social physics" wherein statistical methods were to lead to natural laws of social behavior, almost independent of free will.

Stigler notes that statistical methods were quickly adopted in the psychometric work of Gustav Fechner and Hermann Ebbinghaus, where the heterogeneity problem could be solved by controlled experiments. But in most of the social sciences, where controlled experiments are not possible and data are heterogeneous, Stigler finds the solution in regression analysis. It enabled Galton and his successors to hold constant, conceptually, factors responsible for heterogeneity.

Stigler portrays Galton as the imaginative idea man who originated the concept of regression (though he used medians rather than means); Edgeworth as the theorist who developed and generalized its mathematics; Pearson as the zealot who saw the power of Edgeworth's work, developed the methodology, and sold it to the world; and Yule as the technician who saw that linear regression can substitute for controlled experimentation, and who laid the foundation of the analysis of variance. Stigler closes with the second great synthesis, uniting least squares with the theory of regression and correlation. An economist might wish for mention of the simultaneous-equations-bias problem among those cited as not solved by regression and correlation, but that is a minor matter.

There are many amusing sidelights. For example, a report to Napoleon on the progress of mathematics said that Legendre's method sets the sum of the squared deviations to zero!

Was this deliberate exaggeration, or ignorance? We do not know. Another: A distribution of the heights of 100,000 French men called for military service showed 2,275 more men exempt for being too short than would have been expected under the normal curve, and fewer men than expected in the group just above the eligibility limit. Quetelet's conjectured explanation: fraudulent under-reporting of the heights of some 2,200 men who should have been required to serve.

Stigler tells his tale with enthusiasm, grace, and style. He conveys a sense of high intellectual drama. He shows the place of statistics in the broad sweep of scientific method. He has written a truly admirable book.

#### 040 ECONOMIC HISTORY

*Money and banking in medieval and Renaissance Venice. Volume 1. Coins and moneys of account.* By FREDERIC C. LANE AND REINHOLD C. MUELLER. Baltimore and London: Johns Hopkins University Press, 1985. Pp. xx, 684. \$45.00. ISBN 0-8018-3157-1.

JEL 86-0050

The Venetian city-state played an important role in the economic development of premodern Europe. Strategically situated at the crisscrossing of trade routes linking Western, Central, and Eastern Europe with the Mediterranean and Levantine worlds, Venice emerged in the high Middle Ages as one of the eminent centers of mercantile activities, which it remained through the Late Middle Ages and the Renaissance, and even beyond. Indeed, for some portion of this centuries-long span Venice occupied a pre-eminent position in the trade of the West. No other single locus exerted so strong an influence for so long a period of time.

After five centuries or so of a relatively obscure existence, the city of Venice began its rise to power in the early eleventh century. By the beginning of the thirteenth century the Republic ranked as a major imperial power, and by the latter part of that century it was the center of the European bullion market. A attainment of that status was certainly promoted by its position as the natural Mediterranean

for silver from Hungarian and German. More than geography was involved, for, as the authors show here—and about the study—the importance of the gap between Republican policies and the rise of the city's economic for-

story told by Reinhold C. Mueller and Frederic C. Lane explains this Venetian element in terms of the success of the Republic's inhabitants in developing a viable and complex system of managing moneys of account, coinage, and trade in bullion, within the framework of a bimetallic monetary frame. During the Middle Ages, long-distance trade was financed on the basis of coins or bills, and as the period progressed, on the basis of written instruments defined in terms of value. A welter of political entities, large and small, minted coins, the reliability of which varied tremendously. Thus, a premium became attached to moneys of account that exhibited a reasonable degree of stability, and it was this such a reputation that the money market of Venice established, and upon which built their dominant position in international trade and foreign exchange.

This is a work of formidable scholarship. Lane and Mueller have drawn upon a widely diverse range of sources, ranging from individual merchant account books, notarial registers, and collections of mercantile practices, to legislation and governmental decrees, the records of the Venetian Mint, and the coins themselves. Incidentally, are excellently illustrated. On this base may be, it is of course not without important lacunae: there is, for example, no continuous price series of any real value for Venice. The authors work the extant evidence for all it is worth, carefully and with great artistry, making clear what the records tell us, and what we are unable to know,

the book makes a major contribution to the study of money as a measure of value and a medium of exchange. It offers a rich and vast amount of evidence, explored in painstaking detail. Yet this major virtue also finally becomes the source of its most serious shortcoming: the authors never do succeed in lifting their view from the level of the particular to that of the general. The book lacks any underlying

or unifying theme. As suggested at the outset of this review, what makes the study of this period of Venetian history worthy of special interest is the significant role played by Venice in the economic history of the West, in what is often termed "the rise of capitalism." The authors' failure to relate their very admirable treatment of the specifics of the Venetian experience to that larger—and most important—process is a major disappointment.

Aside from this criticism, however, the volume stands as a testament to high scholarly standards. There is much to be learned within its five-hundred pages of text and one-hundred-forty pages of appendices, whether the reader's interest be in matters monetary, numismatic, or economic historical. Ironically though, for the reason noted, the book will likely have less to offer to economic historians, in general, than to those members of the profession interested in learning something about the evolution and articulation of an early monetary system.

Lane was the principal author of this volume, which focuses on coinage and the moneys of account, and brings the story up to 1508. The planned second volume is to turn attention to an analysis of the development of banking institutions and practices. Perhaps that is where the authors intended to address the broader issues and framework.

RICHARD ROEHL

*University of Michigan, Dearborn*

*The economic organization of war communism, 1918–1921.* By SILVANA MALLE. Soviet and East European Studies series. Cambridge, New York and Sydney: Cambridge University Press, 1985. Pp. xv, 548. \$49.50. ISBN 0-521-30292-7. JEL 86-1018

In this history of the early Soviet economy, Malle assesses "the degree of correspondence between legislation and its implementation" (p. 24) and the relative importance of ideological and pragmatic influences on institutional innovation. She covers nationalization, enterprise management, macroeconomic policy and performance, industrial administration and planning, food requisitioning, and military procurement.

Malle argues that the Bolsheviks initially favored selective, gradual nationalization of industry but were quick to ideologically rational-

ize accelerated nationalization prompted by labor unrest and civil war.

Management underwent a rapid evolution, imperfectly reflected in legislation. The Bolsheviks first promoted workers' control as a counterweight to politically conservative managers but later restored one-man management in the interests of efficiency and accountability.

Revenue from taxes and state enterprises covered only a small fraction of government expenditure. A potentially important source of revenue—rent on nationalized land—was foregone in an effort to win peasant support. The budget deficit was financed by printing money. From 1919 onward the Bolsheviks claimed that rapid expansion of the money supply served not only to finance the budget deficit but also to destroy the purchasing power of money held by remnants of the bourgeoisie. Malle argues inconclusively that the Bolsheviks did not have the latter aim in view when they began the monetary expansion. The timing of pro-inflation statements suggests to her an effort to "rationalize" an unintended development (p. 174). Yet if the Bolsheviks initially intended to use inflation to expropriate money-holders, they would not have wanted to forewarn their victims and erode the base of the inflation-tax. Malle believes that the supposed inflationary intentions were belied by "the relationship between money issue and the rate of price increases. The rate of issue always lagged behind the rate of money depreciation" (p. 179). But this relationship is found whenever the velocity of money rises, as it typically does in a period of accelerating inflation, regardless of the authorities' intentions (Cagan 1956).

In 1920–21 the mean quarterly growth rates of the nominal money supply and the price level were 47.8 percent and 79.4 percent respectively. Surprisingly, Malle does not view the monetary expansion as the major cause of the inflation. Rather, she asserts that "price increases were determined in the first place by the fall in production, and in the second place by the high velocity of circulation of money, induced by inflation itself" (p. 179). Neither part of this explanation makes sense. Production was falling at a quarterly rate of only 1.3 percent (Clarke 1972, p. 6). A high velocity helps explain a high price level, not a high inflation rate.

Marxist ideology, Malle argues convincingly, encouraged centralization but provided no detailed scheme of industrial administration. The exigencies of civil war and interagency bickering shaped the organization of Soviet industry. War communism did not crystallize into a stable set of institutions before it gave way to the New Economic Policy in 1921. Nonetheless it inspired theoretical work on economic planning that found application a decade later when attempts at central planning were resumed.

The breakup of large estates in 1917–18 reduced food marketings. When the supply of food to cities and the army fell to worrisome levels, the Bolsheviks launched a campaign to requisition from rich peasants all food in excess of consumption requirements. Their efforts to enlist poor peasants in the campaign were not very successful. Malle believes the Bolsheviks overestimated their chances of splitting the peasantry because they overlooked a leveling trend in the distribution of rural wealth. Paraphrasing Teodor Shanin (1972), she notes that longitudinal studies of peasant households reveal "a strong centripetal mobility in relation to median wealth, i.e. the rise of the poorer households and the descent of the wealthier ones" (p. 336). It is not clear what conclusions Malle wants to draw. Regression toward an average is not evidence of declining variance. (Remember Francis Galton and his peas!) Nor is movement of households among strata self-evidently conducive to social harmony. Arguably, newly impoverished groups are militant until they become resigned to poverty and parvenus are resented until their privileges come to seem natural (Moore 1978). Perhaps the Bolsheviks' difficulty in mobilizing poor peasants was due more to a lack of rural cadres than to a misassessment of rural stratification. When the Bolsheviks abandoned requisitioning in 1921, their stated reason was not resistance by poor peasants but disincentives to food production.

Provisions for a growing army were squeezed from a contracting economy by radical measures, detailed by Malle. Rations for workers in military industries were set above average but docked to penalize absenteeism. Workers in critical industries were put under military discipline. When nationalized industry was unable to supply needed goods, craftsmen were mobilized. Food was requisitioned. Army units

aged in combat were put to work in and gathering wood for fuel. Malle arguably that the most durable legacy of measures was a militarization of socialist y.

She has done extensive documentary research. Her thirteen-page bibliography lists in six languages. Sixty-six tables present otherwise inaccessible data. In a work scale, rough spots are not surprising. expositions of Soviet writings are occasionally cryptic; in some cases she may have a faithful summary of a muddled document failed to flag the confusion. She does explain the derivation and meaning. She underutilizes theoretical and statistics. Nonetheless, she has produced a informative work, an indispensable ref-

These three essays, based on the second set of our Okun Memorial Lectures at Yale University, examine some central empirical issues in business cycle analysis from a comparative perspective. The comparisons are either time (the prewar vs. the postwar U.S., lectures I and III) or across countries (the experience of the U.S. vs. that of several European countries, in Lecture II). Methodologically, the essays revolve around estimates

of informally derived equations, in traditional Brookings fashion. The lectures are addressed to a wide audience, ranging from policy makers to research economists, and perhaps including educated laymen.

In the first essay, Schultze discusses the inertial nature of inflation, with an emphasis on changes in the behavior of the U.S. inflation process over the last century. In the second essay, he compares the U.S. and several European countries with respect to the rigidity of real wages. Finally, the third essay examines possible explanations for the allegedly greater volatility of real GNP and other cyclical indicators in the pre-World War I, as opposed to the post-World War II, United States.

Lecture I is an attempt to forge some middle ground between the now standard "natural rate" Phillips curve with rational expectations and a traditional "invariant" Phillips curve. Given the degree of inertia which one can get out of existing Phillips curves models with staggered or asynchronized price setting—even in the presence of rational expectations—it is not clear what we gain from this enterprise. At any rate, the route taken here, which is declared to be in the tradition of Okun and George Perry, is somewhat different, emphasizing the cognitive dimensions of wage setting behavior instead of the formal timing aspects. Schultze argues that moderate short-run changes in price inflation do not get incorporated into expectations (or "wage norms," as Schultze prefers to call them) at all, so that the short-run behavior of the economy may be close to that described by the pre-accelerationist Phillips curve. Agents do, however, perceive (and respond to) major changes in regime, such as occurred in 1896 when a deflationary regime associated with a dearth of gold-mining gave way to one of abundant gold supplies and inflation, or in 1973-74 when supply shocks were recognized as ubiquitous for the first time. At the level of econometric implementation, Schultze's preferred Phillips curve concept revolves around the inclusion of dummy variables for the years 1896, 1968, and 1974. This is disappointing, as it has the air of ex post rationalization rather than that of hypothesis formation and testing.

Chapter II takes issue with the now orthodox view of the persistence of European unemployment since the middle 1970s. Schultze argues

that once a correction is made for movements in the real exchange rate, European real wages are, if anything, more downwardly rigid than those in the United States. Schultze notes (see page 53) that the argument here may not be fully convincing, precisely because of its dependence on corrections for movements of the real exchange rate. I would go a step further, and note that modern theories of small open economies (variants of the so-called "dependent economy" model) stress the intimate connection between movements in real wages and movements in real exchange rates. Schultze's conclusion rests on the auxiliary restriction that "the nominal exchange rates adjust to keep the real exchange rate constant" (p. 50). Yet, in the case of small open economies, it is very difficult to conceive of movements in the real wage without having such variations felt in the real exchange rate.

Chapter III considers the variability of output in the pre-1914 period vs. the post-World War II years. Schultze dismisses Christina Romer's arguments that the apparently greater stability of output in the postwar era may be an artifact of data construction procedures far too quickly. He then goes on to argue that, to the extent that output was less stable in the earlier period, one should not place the blame on exogenous instability in the money stock during that time. Although I am sympathetic to Schultze's conclusion, I do not find his major piece of evidence—the low degree of variability in annual data on pre-1914 commercial paper rates—convincing. Nominal interest rates from the early period show dramatic high frequency variation, though they look rather stable at the annual frequency because of their lower degree of persistence relative to postwar rates (N. Gregory Mankiw and Jeffrey A. Miron, "The Changing Behavior of the Term Structure of Interest Rates," *Quart. J. Econ.*, May 1986, 101(2), pp. 211–28). Even avid proponents of the monetary view will grant that the liquidity effects of monetary shocks on interest rates are short lived. With an appropriate propagation mechanism, one may well be able to generate substantial instability of output from the high frequency interest rate movements which are excluded from Schultze's annual data.

In summary, though I find few of the major arguments in these lectures persuasive, I do

find the topics stimulating. I recommend this book to those who are sophisticated enough to appropriately filter the arguments, and sufficiently flexible to tolerate the inevitable ambiguities.

## 100 Economic Growth; Development; Planning; Fluctuations

### 120 COUNTRY STUDIES

*The Israeli economy: Maturing through crises.*

Edited by YORAM BEN-PORATH. Cambridge, MA and London: Harvard University Press, 1986. Pp. viii, 426. \$45.00. ISBN 0-674-46878-3. JEL 86-1047

This volume includes seventeen essays by prominent Israeli economists on the evolution of Israel's economy in the first thirty-five years of its independence. The major themes follow closely those set out by Don Patinkin (1960) in a review of the first ten years of Israel's history. The effect of mass immigration, the evolving sectoral structure of the economy, changes in the quality of the labor force and patterns of earnings, the impact of defense spending, the unusual macroeconomic problems Israel has experienced and many other topics are covered with competence and originality. In a short review, I can focus on only a few of the papers likely to be of general interest.

Israel experienced extraordinarily rapid growth in per capita GNP between 1950 and 1973, with relatively slow growth, comparable to the OECD experience, since 1973. Thorough growth accounting explanations of the change in aggregate performance are provided by Jacol Metzger, who documents the slowdown in both capital accumulation and total factor productivity growth. The post-1973 period was characterized by an increasing rate of inflation, an outward shifting Phillips curve, and a deteriorating current account. Michael Bruno notes the similar experience in OECD countries with the exception of the accelerating rate of inflation. The growing rate of inflation in the late 1970s and early 1980s receives careful analysis in several papers including those of Bruno, Bruno and Stanley Fischer (the only non-Israeli contributor), and Leviatan and Pitterman. While the

authors differ in emphasis, they all reject an important autonomous role for wage indexation (a process carefully examined by Kleiman) while emphasizing the importance of Israel-specific features of the capital market. The precise mechanism by which forces that, in other economies, lead to a change in the price level result in an increase in the rate of inflation in Israel receives particularly close attention in several of the papers although there are significant differences in emphasis among the various authors. The basis of the 1985 stabilization plan adopted by the Israeli government can be gleaned from the papers in this section, as several of the authors were important in the policy-making process.

The microeconomic papers follow a long tradition, begun in the early 1950s, that attempts to explain major features of Israel's economy such as the high and rising share of services (Klinov), the excessively high allocation of investment to housing (Mayshar), the effect of the high and rising level of education on wage structures (Amir), and the forces maintaining income differentials among population groups that immigrated from different regions (Ben-Porath). Except for a paper by Syrquin comparing many dimensions of Israel's growth experience with that of other countries, there is little reference to developments in other nations. Yet many of the phenomena analyzed are similar to those in other countries and Israel's patterns of development and difficulties do not appear as unusual as is occasionally implied by some of the authors.

A significant omission in the microeconomic section is the absence of attention to Israel's technological development which permitted an extraordinarily rapid rate of growth of industrial exports despite government policies that provided a bias towards sales in the domestic market. Recent rapid growth in nontraditional exports such as scientific instruments, agricultural technology, and metal products (including weapons) reflects considerable investment in the acquisition of technological capability as well as intelligent science and tax policies with respect to these sectors. Future macroeconomic policies to reduce domestic absorption and to improve the profitability of exports would not be as promising if potential exports consisted solely of traditional products such as textiles,

clothing, and polished diamonds whose profitability is threatened by new producing countries. The vastly augmented production capability in newer sectors was, in many cases, not an endogenous response to changing comparative advantage but reflects specific interventions to alter the structure of production (Teubal 1983).

A paper by Berglas analyzes the impact of the country's huge defense expenditures, averaging over 25 percent of GNP during the last fifteen years, in contrast to the three or four percent typical of most Western European countries. A careful evaluation of other costs not included in conventional GNP accounting suggests a still greater burden. While there are some economic benefits, including the spinoffs from technological developments, it is clear that defense requirements have exerted a major negative impact on the level and rate of growth of national output.

Despite its unique origins and continuing security problems, Israel's economic performance has been fairly good though less than might have been expected in the last fifteen years. The papers in this volume demonstrate fairly conclusively that a large part of the disappointing performance is attributable to poor government policy. To some extent this reflects an incomplete understanding among economists in Israel, and elsewhere, of inflation in an open-economy setting; even now there is only tentative agreement on the outlines of a new paradigm. But the Israeli government also failed to use the considerable useful knowledge that was available in the universities, the Bank of Israel research staff, and its own ministries. The decision to ignore such advice partly reflects electoral politics, the familiar political business cycle. More deeply, it stems from a crisis in institutions. As Ben-Porath notes in his superb introductory essay, the institutions that were of importance for nation building may not be appropriate in a modern economy that needs to respond quickly to a variety of changing conditions. The current dilemma is nicely captured by Syrquin,

The Yom Kippur War, the energy crises, recessions in advanced countries, and the slowing of population growth combined to cast doubts on Israel's capacity to accommodate divergent interests. A zero-sum view of the economy and society

seems to have eroded the long-standing national consensus on objectives. The next decade will tell whether the proper reference group in future international comparisons will be Scandinavia as long-term trends indicate, or South America, as the recent past suggests. (p. 74)

#### 130 ECONOMIC FLUCTUATIONS; FORECASTING; STABILIZATION; AND INFLATION

*Indexing inflation and economic policy*. By STANLEY FISCHER. Cambridge, MA and London: MIT Press, 1986. Pp. xi, 490. \$25.00 ISBN 0-262-06098-1. JEL 87-0085

Following the injection of the rational expectations concept into macroeconomics approximately 15 years ago and the ensuing (monetary) policy ineffectiveness debate, the field underwent a major transformation. The energy shocks of the seventies led to a reexamination of the costs and consequences of inflation and to thorough investigations of the effects of widespread indexation. Fischer's important and sometimes pioneering contributions to those topics have appeared in various professional journals and conference volumes. This book brings these articles, some of which have become classics (like Ch. 1 and 2 on the costs of inflation, Ch. 5 on wage indexation and stability, Ch. 9 on the demand for index bonds, and Ch. 13 on the optimal money supply rule), under one cover. It also features a number of previously unpublished policy oriented essays. The book represents Fischer's research in the area of inflation, indexation and economic policy between the mid seventies and the mid eighties. It is a blend of theory, empirical work and good sense all aimed at delivering concrete and informed answers to practical policy questions.

The book contains seventeen essays that are divided into four groups. The first group deals with the welfare effects of inflation and the public's attitudes to it. The second explores various macroeconomic interactions between indexing

and economic policy and examines the relative merits of alternative disinflationary strategies. The third investigates the factors that determine the demand for and supply of index bonds, offers an extensive discussion of the reasons for the nonexistence of such bonds in the U.S. and examines the welfare aspects of governmentally issued index bonds. The last group discusses a wide spectrum of macro policy issues ranging from the desirability of activist monetary policy in the presence of nominal wage contracts to the problem of dynamic inconsistency of fiscal policy.

I turn now to a more detailed description of the book's essays. Chapter 1 (with Franco Modigliani) is a systematic listing of the effects and costs of inflation and of inflation uncertainty in the presence of nominal government institutions. Chapter 2 makes a bold attempt at quantifying the costs of a ten percent inflation for the U.S. economy given the institutions this economy had at the beginning of the eighties. The chapter's conclusion is that the total cost of inflation in the 1980 U.S. economy is far from being negligible. Chapter 3 launches into the relationships between inflation, inflation uncertainty, and relative price variability and concludes that much of the positive association between inflation and relative price variability in the seventies was due to food and energy shocks.

Chapter 5 is one of the first formulations of the, by now well-known, result that wage indexation stabilizes output and employment in the face of nominal shocks and destabilizes those two variables when supply shocks predominate. Chapter 6 investigates possible links between indexation and inflation. Using cross sectional data on a sample of forty countries during the first oil shock the chapter concludes that the more heavily indexed countries accommodated the first oil shock less than the less heavily indexed countries. Chapter 7 examines the employment costs of disinflation for alternative disinflationary strategies. The basic difficulty faced by stabilization programs that are based mostly on monetary contraction is that the contraction operates only on currently negotiated contracts. The chapter notes that the sacrifice ratio (output loss per unit of reduced inflation) depends on whether expectations are rational or adaptive and on the credibility of policy. A more relevant

distinction that broadens the chapter's results seems to be between quickly and slowly adjusting expectations both of which are rational. Chapter 8 discusses the output costs of disinflation when the exchange rate is used as a nominal anchor. Factors favoring an exchange rate over a money target during disinflation are discussed. The lessons of this chapter and of the unpublished paper on which it is based may have influenced the successful July 1985 Israeli stabilization package.

Part III which focuses mostly on the theory of the demand, supply and valuation of index bonds is not discussed for reasons of brevity.

The first chapter of Part IV (Ch. 13) is a well-known paper on long-term contracts and the optimal money supply rule which demonstrates that activist monetary policy is feasible and desirable even with rational expectations. The origin of the result is in the (realistic) assumption that nominal contracts stretch over a period that is longer than the period over which new relevant information becomes available. Chapter 14 summarizes the case in favor of activist monetary policy. Chapter 15 is one of the clearest formulations of the dynamic inconsistency of optimal fiscal policy. The chapter brings out the reason for the remarkable result (originally due to Finn Kydland and Edward Prescott 1977) that the optimal policy is time inconsistent even when all individuals are identical and the policy maker maximizes the utility of the representative individual. Chapter 16 discusses the case for and against a national money. The chapter concludes that the benefits of a national money outweigh its costs. Chapter 17 is a case study of the Israeli inflation and indexation during the end of the seventies and the first part of the eighties.

In the debate about the effectiveness and the desirability of activist monetary policies Fischer comes out as a strong believer in activist policy. This position as well as results concerning wage indexation and stability and the impact of alternative disinflationary strategies are all anchored on the nominal contract paradigm. That is, the nominal wage rate is predetermined for the period of the contract and employment during the contract period is determined unilaterally by employers. There is little doubt that many wages are fixed for some time. However, the evidence on whether the employment decision

in actual contracts is left to the employer is less clear. The book claims that in real life contracts it is left to the employer but does not provide much evidence. This and the closely related theoretical question concerning the optimality of Fischer-Taylor nominal contracts should be viewed as subjects for future research. In general the models used in the book are rigorous but stripped down to the minimum necessary to discuss the main issue at hand without cluttering it with secondary details. It is interesting to observe how the author's research focus evolved over time from various aspects of indexation in the mid seventies, through an extensive examination of the costs of inflation at the end of the seventies, to an investigation of alternative disinflationary strategies later on. The correlation of those issues with the rate of inflation in the U.S. is notable and underlines the focus of the book on timely policy issues.

In conclusion academic, as well as policy oriented, economists will find in this collection of essays some of the most authoritative, up to date and relevant discussions of inflation, indexation and related policy issues.

JEL 87-0086

*The American Business Cycle* is a book that all macroeconomists will want to own. This NBER conference volume contains thirteen essays that place the modern American business cycle in historical context. The essays analyze such topics as how the behavior of the components of expenditure have changed over time and why aggregate economic performance may have improved between the prewar and postwar eras. While the various chapters make for

interesting reading, the book will be most useful as a compendium of facts. Economists interested in a wide variety of macroeconomic relationships will be able to discover the nature of those relationships in the periods on either side of World War II.

Unlike most conference volumes, *The American Business Cycle* is a reasonably coherent work. Most of the papers focus on the "continuity and change" in the American business cycle mentioned in the book's subtitle. The exceptions to this focus are found in the first section, which contains papers on the nature and source of cyclical behavior in the postwar period. One of the most interesting papers in this section is Olivier Blanchard and Mark Watson's analysis of "Are Business Cycles All Alike?" This study combines a vector autoregression and a simple structural model fitted to the resulting residuals to identify the source of shocks to the economy and to discover whether business cycles are caused by small, frequent shocks or by large, infrequent shocks.

Another important paper in this section is J. Bradford DeLong and Lawrence Summers' contribution, "Are Business Cycles Symmetrical?" This study examines the usual assertion that downturns are brief and severe relative to trend while expansions are longer and more gradual. DeLong and Summers conclude that business cycles are in fact reasonably symmetric. As a result, they argue that there is little reason to prefer the traditional reference cycle approach to modern time-series methods.

The other sections of the book deal with more historical topics. One major section includes three studies that analyze the continuity and change in the cyclical behavior of consumption, fixed investment, and inventories. All three of these studies contain interesting facts about the role of each component of expenditure in determining aggregate behavior. However, they share the common limitation that they only deal with the period after 1919; they thus identify the "prewar" era with the Great Depression and reveal nothing about the American business cycle before World War I.

This same limitation applies to Ben Bernanke and James Powell's otherwise excellent paper, "The Cyclical Behavior of Industrial Labor Markets." Included in the section entitled "Changes in Cyclical Behavior," it compares

the behavior of employment, wages, and productivity in the 1920s and 1930s to that in the postwar era. The paper analyzes a neglected National Industrial Conference Board data set derived from a monthly survey of a wide variety of manufacturing industries. Using modern time-series methods, Bernanke and Powell conclude that facts typically associated with the postwar labor market, such as procyclical labor productivity, apply to the interwar period as well.

Also included in the section on changes in cyclical behavior is an important debate between John Taylor and DeLong and Summers on the source of improvements in macroeconomic stability between the prewar and postwar eras. Taylor argues that macroeconomic performance improved despite a decline in wage and price flexibility because the shocks to the economy were smaller in the postwar period. DeLong and Summers, on the other hand, argue that the decline in wage and price flexibility actually caused the stabilization by preventing destabilizing movements in expected inflation and hence in the real rate of interest.

While the preceding discussion should make clear that there is much of interest in *The American Business Cycle*, it is perhaps useful to note some of its limitations. The most obvious concerns methodology. Nearly all of the authors pay homage to Arthur Burns and Wesley Mitchell's classic study *Measuring Business Cycles* (1947). However, in place of the Burns and Mitchell reference cycles methodology, most of the authors use vector autoregression (VARs) to establish the "facts without theory." Indeed, the use and respect for VARs is so prevalent in these essays that the authors of one of the few papers that includes a structural model feel compelled to explain to their colleagues that their model "is a vector autoregression that has been constrained in a particular way suggested by economic theory" (p. 195).

The widespread use of VARs in many ways makes the analysis in several of the papers seem quite dated. While VARs were very new and appeared exceedingly promising at the time the papers were written, much has been learned in the nearly three years that elapsed between the conference and publication. For example, the research of Thomas Cooley and Stephen LeRoy (1985) has shown that many of the as-

ms associated with variance decomposition impulse response functions are as ar as the zero restrictions VARs were sup- o avoid. Furthermore, VARs tend to edingly hard to interpret. A common of many of the papers is that the VAR are ambiguous. I suspect that Allen ; a discussant at the conference, is cor- noting that "a principal conclusion to m is that you cannot get something for . If we are unwilling to impose a struc- the data . . . the data may mislead us epting that the world is as lacking in e as this approach" (p. 449).

ond way that the book is somewhat lim- at it is basically Keynesian in approach. for an article by Robert Barro on the of budget deficits, the New Classical h to business cycles is ignored. Simi- he recent controversy over whether in fact a business cycle is not discussed.

the papers deals with the finding of Nelson and Charles Plosser (1982) (and iently elaborated on by John Campbell

Gregory Mankiw, forthcoming) that ay be a large permanent component ations in output.

resence of these limitations should not rom the importance of *The American Cycle*. Rather, it should point out how urther research is needed before econo- nderstand the nature of economic fluctu- nd how those fluctuations have changed ie. It is precisely in this future research

*American Business Cycle* will be most Its compilation of facts and insights will the starting point for additional re- on economic fluctuations in the years

The principal thesis of this volume is the im- portance of allowing explicitly for international interdependence in the formulation and execu- tion of national economic policies. This convic- tion is rooted in the collective experience of the authors as long-term staff members of the Organization of Economic Cooperation and De- velopment (OECD). The book is both a non- technical primer on econometric forecasting and policy analysis using the OECD INTER- LINK multinational model and a commentary on and history of economic policy and its effects in the OECD region since the 1950s.

Part I deals with policy making in an open world economy, including chapters on the con- tribution of policy in the 1950s and 1960s, policy successes and failures since the early 1970s, and the increasingly important influence of in- ternational linkages through trade, investment and finance. The discussion of linkages stresses both the external constraints on macroeconomic policies of individual countries,

Hence for reasons that begin with the balance of payments and end with inflation, a country has little scope, in the great majority of cases, to allow its domestic demand to grow signifi- cantly faster than its traditional relativity with demand in its trading partners (pp. 58-59)

and the amplification effects of synchronized expansionary or contractionary policies. These propositions are documented primarily by in- formal verbal analyses of selected historical epi- sodes. It is disappointing that greater use was not made of quantitative econometric analyses of the various historical episodes, such as must have been made with INTERLINK and are also available in publications from Project LINK and other multinational modeling efforts. Similarly, there is very little systematic information pro- vided on linked and unlinked policy multipliers in the OECD model.

The heart of the book is Part II on international economic forecasting; it contains a description of the genesis and characteristics of the INTERLINK model and its central role in the development of the semi-annual forecasts prepared for the meetings of the OECD Economic Policy Committee and subsequently published in the *OECD Economic Outlook*. In keeping with the purposes of the authors, the description of the structure of INTERLINK is qualitative and informal—nary an equation is to be found—providing the general reader with a basic outline of the system and its capabilities but containing little documentation for informed judgment on the technical merits of the model.

In common with most multinational systems, INTERLINK comprises a set of structural country models which are linked together by endogenous trade flows and prices as well as endogenous exchange rates and capital flows. The country models themselves are basically disaggregated IS-LM models augmented with supply-side equations for wage (labor-market Phillips curves) and price (markup equations with capacity utilization constraints) determination. On the international level, commodity prices also feed back to domestic cost and price structures. Consistency of trade and financial flows and prices is assured by appropriate weighting procedures in the world solution algorithms.

The description of the role of INTERLINK in the making of the periodic OECD forecasts will be especially interesting to users of the forecasts. The INTERLINK model basically determines the international consistency of the linked country forecasts, operating within the nontrivial constraints that policy variables must be set consistently with announced economic policies of the member governments and that nominal exchange rates are assumed to be unchanged over the 18-month forecasting horizon. Country-model inputs are provided largely by desk officers, and procedures have been worked out for systematic interaction between the INTERLINK model and the country specialists as the linked forecast evolves through successive rounds. The final forecasts as published have therefore been scrutinized closely within the OECD research organization and also by experts from OECD member countries and the Economic Policy Committee. Presumably, however, the published forecasts may not rep-

resent the preferred unconditional forecasts of the INTERLINK team, owing to the aforementioned constraints involving announced policies and constant exchange rates.

Part III contains a capsule history of macroeconomic policies in the OECD region during 1979–1983 and a chapter on international cooperation in economic policy making, including historical examples of successful cooperation during the Smithsonian currency realignment of 1971 and the agreement on a coordinated policy package at the Bonn Summit of 1978. The authors conclude that cooperation involving joint commitments to specified policy actions has been disappointingly slim and discuss some of the obstacles to greater cooperation. Positive suggestions are offered as immediate steps to improved international cooperation: (1) achievement of agreement on appropriate policies to improve supply-side performance by moving toward more market-conforming behavior, and (2) intensification of timely exchange of information among countries about current policy motivations, plans for the period ahead, and the ways in which they would be likely to respond to various contingencies.

As the authors note, INTERLINK is not a research vehicle but a framework for deploying the empirical work of OECD Secretariat's Economics and Statistics Department on issues which the Secretariat is regularly called upon to address (p. 162). This book provides an excellent description of the policy environment and institutional setting within which the model is employed and a judicious appraisal of the successes and failures of macroeconomic policy making in general since the 1950s.

## 200 Quantitative Economic Methods and Data

### 210 ECONOMETRIC, STATISTICAL, AND MATHEMATICAL METHODS AND MODELS

*Fixed point theorems with applications to economics and game theory.* By KIM C. BORDER. Cambridge, New York and Sydney: Cambridge University Press, 1985. Pp. viii, 129. \$29.95. ISBN 0-521-26564-9. JEL 86-0447

I remember that, as a graduate student studying mathematical economics, I was constantly

on the lookout for good reference books. Where could I find the most elementary proof of Michael's selection theorem? What was the relationship between Brouwer's fixed point theorem and the Knaster-Kuratowski-Mazurkiewicz lemma? The problem with looking through mathematics textbooks is that the topological tools used by economists are so specialized and that mathematics books contain so much information not immediately relevant to a mathematical economist. Books about mathematical economics, on the other hand, contain only the mathematics directly relevant to a specific application, often given without proofs and without explanations of interconnections between different mathematical results.

This little book is the one that I was always looking for as a graduate student. It is a systematic presentation of the fixed point theorems used in mathematical economics and game theory. As well as presenting statements and proofs of these theorems, the author shows how they are relevant in economics and game theory.

After a brief introduction to general equilibrium models and games, the book develops the basic concepts of convexity theory and topology to be used. It then goes on, over the space of four short chapters, to prove the Knaster-Kuratowski-Mazurkiewicz lemma and Brouwer's fixed point theorem. The approach used is the combinatorial one: the author defines the concept of simplicial subdivisions and proves that each one contains a completely labeled subsimplex. This is, of course, Sperner's lemma. Using the fact that every sequence on a compact set has a convergent subsequence, he then easily obtains the K-K-M lemma and Brouwer's theorem. This approach is a popular one in economics because, as the author explains, Herbert Scarf has converted a constructive proof of Sperner's lemma into an algorithm for computing approximate fixed points.

Using similar elementary approaches the author proves a number of important results that have been used by mathematical economists and game theorists. The most central of these are: the maximum theorem, which gives conditions under which the set of solutions to a constrained maximization problem varies as an upper-hemi-continuous, point-to-set correspondence with the parameters of the problem; Michael's selection theorem, which gives conditions under which a continuous function can

be selected from a correspondence; Kakutani's fixed point theorem; and the Fan-Browder theorem, which gives conditions under which two correspondences defined on the same set have image sets that intersect.

The emphasis here is on the mathematical results themselves rather than their economic applications. Nonetheless, proofs of the existence of equilibrium in market economies, of Nash equilibria in noncooperative games, and of the core of cooperative games are included. The author has an interest in economies and games in which the agents do not have transitive preferences, and so the book puts special emphasis on this topic, proving a number of original results.

Perhaps the book's greatest strength is that the level of mathematical sophistication it requires is uniform throughout. If the summary of its contents in the previous three paragraphs does not sound familiar, then this book is not for you. There is nothing in it, however, that a graduate student studying mathematical economics should not be able to follow and understand. Another feature that I find particularly attractive is the stress that it puts on the interconnections and cross-references between results. There are, in fact, two chapters devoted to such interconnections, for example, how the Fan-Browder theorem implies Kakutani's theorem, how the equilibrium existence theorem implies Brouwer's theorem, and, of course, how the K-K-M lemma both implies and is implied by Brouwer's theorem.

One minor shortcoming is that the author cannot seem to decide whether he wants a textbook or a reference book. On one hand, too many proofs of results are left for exercises for it to be an ideal reference. On the other hand, the material is too specialized and there are not enough applications for it to serve as the principal textbook for a graduate course in mathematical economics. I would also have liked to see more use of simple diagrams to illustrate results, although there are a number of diagrams used effectively in the early parts of the book.

A reviewer is always tempted to criticize a book for not being the one that he would write if faced with the same task and endowed with the same amount of energy as the author. As much as I enjoy this book, I will give in to this temptation and mention how disappointed

I was not to see any material on topological index theorems or the Poincaré-Hopf theorem. These results, which are closely related to the material presented in this book, have been used over the past decade to prove the uniqueness of equilibrium in economies and games and, more recently, to prove the existence of equilibria in models with financial assets and models with sunspots. I would have very much liked to have a ready reference to these topics, written with the same conciseness and clarity as the material presented.

Overall, this is a beautiful little book. As a researcher in mathematical economics and a teacher of graduate courses in the subject, I am very glad to have it on my bookshelf. I only wish that it had been written ten years ago so I could have had it as a student.

## 220 ECONOMIC AND SOCIAL STATISTICAL DATA AND ANALYSIS

*Income distribution: Theory, modeling, and case study of Brazil.* By GIAN S. SAHOTA AND CARLOS A. ROCCA. Ames, Iowa: Iowa State University Press, 1985. Pp. ix, 236. \$24.95. ISBN 0-8138-0988-6. JEL 86-1082

In this book, Sahota and Rocca analyze income distribution in Brazil using an ambitious multisector multiregion model. While most specialists accept that the determination of income distribution in less developed countries is a very complex matter, only a handful of intrepid explorers have charged ahead in this direction. Though not the largest such model in terms of number of equations, this one's subtlety of specification makes it an interesting test of the potential of the genre in helping us to better understand income distribution and the policies that affect it. Brazil is an appropriate subject country. If not the extreme case of economic inequality in the world it is in the running; it also has a history of rapid growth and structural change. Both authors have studied Brazil extensively.

Sahota and Rocca begin with a useful chapter reviewing the competing theories of personal income distribution. They then provide chapters on the major building blocks of the overall model—the urban sector, the agricultural sec-

tor, the public sector, and the interregional flows of capital, labor, and goods. These self-contained submodels are tied together in the overall model, which is then used for several exercises in policy optimization. The submodels are used to calculate impact elasticities to show how changes in the exogenous variables affect the income of each of three income classes.

The heart of the book, in which the models are developed and put through their paces, is a hard read, due both to the size of the apparatus and to the frequent terseness of the discussion associated with individual equations. But it is a good base from which to consider the hoped-for strengths and the inevitable weaknesses of the large computable general equilibrium approach to the study of income distribution.

Chapter Two's review of personal income distribution theories, while only loosely connected to the rest of the book, effectively argues the importance of integrating the Cambridge theories of inherited fortunes and the Chicago human capital model. While that need should have been obvious to any but the wearer of ideological blinkers, the marriage has indeed been belated. The modeling of the rest of the book is similarly judicious in weaving together supply and demand side factors, so that results are not prejudiced by built-in bias toward either a strongly neoclassical or a strongly Keynesian structure. Unlike most analysts of distribution, the authors do try to incorporate public consumption in the income concept. And they allow, both in principle and in their estimating procedures, for the possibility that imperfect markets can leave marginal value products unequal to factor payments.

Despite these promising features, avoidable and unavoidable problems diminish the contribution of this modeling effort to a better understanding of income distribution in Brazil. Weakness and incompleteness of the data base is in the main unavoidable, though time does bring improvement. Inadequate time to probe individual relationships and the lack of solid prior work to aid one are matters of degree. Most of the few large distribution-oriented models undertaken so far, including this one, would have benefited from two to three times more work in trying to get the individual equations right, and from more team members to provide

on a wider range of issues. Finally, of the more serious weaknesses of the under review, the opaque nature of models coupled with the costliness and difficulty of providing evidence on robustness sensitivity can easily leave even the careful unable to sort the wheat from the chaff. Much credibility should we give the coming from the "urban model" of 1983, that "government expenditure on urban comes out pro-rich" (p. 54) when the effects of changing supplies of educated are not included in the analysis (p. 54)? How plausible is the result that "past urban growth in Brazil, through its general equilibrium interactions, fosters growth of per incomes" (p. 154)? Perhaps it is so, but there are many slips, twixt cup and lip in this analysis. When the result of such a model is at odds with theoretical prediction or with empirical analysis in a partial framework one must be wary, but when the opposite is the case one can only have much confidence in equilibrium results coming from a web-network. Sensitivity analysis and experiments by the authors of the more important conclusions would help. The former is provided here, partly because the technique is optimization rather than simulation; the latter is largely missing and were it provided the doubtful results which emerge from models, would contribute to a much bigger view. Few cautious readers will trust results they not only are but can be seen to be stating well-specified underlying relationships. Showing this is a big job. The individual components of the Sahota model, most of them previously published elsewhere, are, it seems to me, more than the whole. They display much modesty and more care than does their inclusion into the overall model. Their above-average attention to price effects is unusually good. There is no doubt that this exercise is as favorably to most models of the sort. It provides many specific insights for analysts on the distribution in less developed countries both the complete model and the models providing useful heuristic devices in dating the mechanisms underlying the distribution of income. But even leaving aside that the authors' goal of undertaking

dynamic policy analysis with the full model proved computationally impossible with their dynamic program, the basic problems of such models are all too present: one gives away too much of the potential richness of specification possible in partial analysis (partly through lack of knowledge of a specific area, partly through lack of energy, and partly because the model has to be contained within a reasonable size); and the opaqueness of the workings of the model together with the transparent oversimplification of some assumptions reduces its credibility.

### 300 Domestic Monetary and Fiscal Theory and Institutions

#### 310 DOMESTIC MONETARY AND FINANCIAL THEORY AND INSTITUTIONS

*Perspectives on safe and sound banking: Past, present, and future.* By GEORGE J. BENSTON, ROBERT A. EISENBEIS, PAUL M. HORVITZ, EDWARD J. KANE, AND GEORGE G. KAUFMAN. MIT Press Series on the Regulation of Economic Activity. Washington, DC: American Bankers Association in cooperation with MIT Press, Cambridge, MA and London, 1986. Pp. xxi, 358. \$19.95. ISBN 0-262-02246-X.

JEL 87-0116

The American Bankers Association, obviously concerned about the rising number of bank failures, commissioned five reputable economists to study and to report on the principal options and their recommendations for making the U.S. banking system more safe and sound. The basic thrust of the Report is to shore up the existing system of government deposit insurance by innovative reforms that will not appear too unpalatable either to the banks or to the regulators and to introduce more market discipline by having deposit holders and bank stockholders assume more risk while the regulatory agencies assume less.

There are eleven chapters of the Report with each of the five authors having single or joint responsibility for individual chapters. The hazards of such a distribution of responsibility are obvious, but I found few faults with the execution. A Report, more than most multi-authored

books, must be the result of a consensus, since generating recommendations and not simply setting out the state of knowledge is its main purpose.

The first five chapters address the broad questions of bank failure risk, number and significance of bank insolvencies in an historical context, remedies for eliminating bank failure including government and private deposit insurance, and the central bank as lender of last resort. The remaining six chapters analyze and make specific recommendations for allowing a larger role for market discipline as a device for reducing overall bank risk, initiating market value reporting instead of historical cost accounting to improve the quality of basic accounting information, having bank insurance premiums adequately reflect bank risks, and increasing the effectiveness of bank supervision and performance.

A twenty-two page appendix summarizes their recommendations including options specifically rejected. Some of those recommendations include: (1) Risk-adjusted charges for deposit insurance to limit excessive risk-taking by bank owners; (2) the insuring agency and not the chartering agency should be given authority to close insolvent institutions promptly before net worth departs very much from zero to minimize losses of uninsured depositors; (3) more reliance should be placed on market discipline as a disincentive for excessive risk-taking; and (4) as lender of last resort, the Fed should lend only with full collateral or through the deposit insuring agencies.

The authors correctly identify the source of instability of deposit banking as the existence of par-value deposits—deposits fixed in price in terms of the money-of-account. But they say nothing about its rationale. They assume that it is external as do most bankers. Par-value deposit banking provides the depositor with an asset with zero price risk while the bank shareholder assumes the burden of changes in net asset value. Its basic flaw is an innate susceptibility to bank failures. But what is difficult to comprehend is why the authors confined their analysis solely to makeshift rather than to *ultimate* remedies for bank insolvencies. A permanent solution resides in the abolition of par-value deposit banking. By converting depositors from creditors of a bank to mutual fund

shareholders, the threat of insolvency posed by unanticipated asset liquidation vanishes; the full burden of asset losses is assumed by the depositor. Deposits would be treated like shares in an open-end investment company or mutual fund to be redeemed at net asset value. The removal of the threat of bank runs undermines the foundation for entry restrictions into the transactions services industry. Non-par deposit banking removes the chief obstacle to relaxation of legal constraints on complete freedom of entry into the banking industry. Understandably, the authors probably reasoned that so radical a solution was not what the ABA paid them for. Even if unacceptable to the bankers, there are ample reasons for at least informing the nonbank readers of an interesting alternative. The title of the report is: *Report on the Perspectives on Safe and Sound Banking, Past, Present and Future*. Non par-value deposit banking is certainly a feasible future perspective!

The Report takes a revisionist approach to bank runs and their effects. It states that the risk of deposit runs is greatly overstated and that large scale bank failures do not happen to have been a normal part of the American scene (certainly more normal than experience abroad). In their judgment excessive sensitivity to bank deposit runs was a legacy of the Great Depression when more than 9000 banks failed between 1929–1933. It was the aftermath of that trauma that generated the view that all bank failures were an unmitigated evil. But as the authors rightly emphasize, bank failures per se are not necessarily harmful. Most of the failures were highly localized with insignificant effects on overall economic activity. Systemwide bank failures—more familiarly known as financial crises or panics—have had more serious economic effects and are responsible for the public's negative attitude to bank failures.

Bank failures are perfectly consistent with a safe and sound banking system as long as they remain uncontagious. There may be more bank failures with increased bank efficiency and at the same time with appropriate reform less risk of systemwide financial crises. The question, however, still remains unanswered: When and under what circumstances do banking failures become systemwide banking panics? There is little comfort or solace in the author's conclusion: as long as the central bank and the FDIC

meet their responsibilities, there is no danger of a collapse of the banking system. The same thing could have been said of the Fed in 1929.

ELMUS R. WICKER

Indiana University

*Deregulating financial services: Public policy in flux.* Edited by GEORGE G. KAUFMAN AND ROGER C. KORMENDI. Mid America Institute for Public Policy Research Book series. Cambridge, MA: Harper and Row, Ballinger, 1986. Pp. xiii, 223. \$29.95. ISBN 0-88730-111-8. JEL 87-0124

In what respects should banking be regulated? If any, according to what criteria? Not since the debate surrounding Peel's Bank Charter Act of 1844, perhaps, has so much been written as in the last few years on the basic questions concerning government treatment of banks. Today, as then, debate has been stimulated by the manifest problems of a banking industry already regulated more heavily than other industries. Disinterested expert answers in both periods have ranged from "regulate nothing, in the interests of flexibility and efficiency" to "regulate in every way which promises to promote stability and safety."

This volume presents seven essays by knowledgeable economists on how to reform U.S. banking regulation in the twin interests of safety and efficiency for the system. The authors and editors are all currently academicians, but the biographical information identifies every one of them as a former employee or current consultant (presumably paid) to two or more government agencies. The argumentation is both theoretical and historical, carried on in prose adorned by relatively few statistics and almost no equations. The prose is blessedly readable for the most part.

Six of the chapters originated as papers presented at a conference organized by the Mid America Institute for Public Policy Research in June 1985, and are here published for the first time. The exception is Chapter 1 by George J. Benston, an earlier version of which was previously published in the *Journal of Bank Research* for 1983. Benston's essay gives a sweeping historical overview of the reasons (both ostensible and actual) for federal regulation of banking in the United States. The second chapter, coauthored by Benston and George

G. Kaufman, surveys and evaluates the risks contributing to recent bank failures. Chapter 3, by Allan H. Meltzer, urges the U.S. monetary authorities to pre-commit themselves to a Bagehot-type lender-of-last-resort policy. In Chapter 4, Edward J. Kane, drawing largely from a chapter of his recent book on *The Gathering Crisis in Federal Deposit Insurance*, launches a frontal attack against the mispricing and enlarged scope of FDIC and FSLIC deposit guarantees. The fifth chapter offers Michael Mussa's views on the pros and cons of restricting competition by banks. The succeeding chapter, by Franklin R. Edwards, considers the question of banking competition along antitrust lines. In the seventh chapter Robert A. Eisenbeis argues the case for no longer barring firms that provide banking services from entering other lines of financial services and commercial activity.

The policy orientation of all seven essays is moderately free-market. It is moderate in that none of the authors argues for complete *laissez-faire* in banking. It is free-market in that the efficiency properties of unhampered market outcomes are emphasized. Numerous banking regulations are identified as impediments, sometimes intentional, to the development of a financial system that meets consumer demands efficiently. Despite minor differences between the more free-market authors (Benston and Kaufman) and the more moderate ones (Mussa), the range of opinion here is narrow. Far from being a shortcoming, this gives the book a degree of coherence unusual for a conference volume.

A more serious conflict looms between the goals espoused coequally in the editors' preface: efficiency and safety. To recommend more than the efficient level of safety, after all, is to pit one goal against the other. Unfortunately no one in the volume confronts this issue. Mussa's *ex cathedra* paragraph of rebuttal to "a purest [sic] believer in *laissez-faire*" (p. 129) and Meltzer's passing references to externalities (pp. 88, 92) notwithstanding, no author attempts to rebut seriously the viewpoint that a first-best financial system operates under *laissez-faire* with a caveat emptor policy (only fraud is prohibited, and risk of bank failure is something banks and their customers may privately choose to accept or to shift or reduce at a cost). From such a

viewpoint the essays argue largely for second-best reforms. The second-best set of financial institutions they endorse differs from *laissez-faire* by containing a government deposit insurance agency and central bank. It differs from today's status quo principally in having the deposit insurance agency vary its premiums according to the riskiness of a bank's portfolio (every single chapter criticizes the flatness of the FDIC's current premium structure), and in having the central bank precommitted to intervene as a classical lender of last resort (and only to intervene as such).

An exception to the second-best orientation is the chapter by Mussa, much of which takes mispricing of deposit insurance for granted and accordingly descends into the exitless swamp of devising third-best policies which pile restrictions on banks in an attempt to compensate for the associated distortions.

The best chapters are the first (Benston), second (Benston and Kaufman), and fourth (Kane). The first is valuable for its no-nonsense debunking of various myth-based rationales frequently offered for banking regulation. This debunking—showing that the operative motivations for bank regulatory legislation have generally not been market failures but rather the desires to tax and to limit competition—is a useful antidote to the apologies for regulation commonly offered elsewhere, including later in this book. (I do not, however, understand Benston's defense of reserve requirements, for these are subject to the same sort of debunking.) I would recommend this chapter for the reading list of any money and banking course, undergraduate or graduate.

Chapter 2 is recommended for its persuasive explanation of the increased frequency of failures in recent years. Deregulation is exonerated, while extended and increasingly mispriced deposit insurance plays a central role. Kane in Chapter 4, far more than any of the other authors, comments perceptively on the political obstacles that free-market reforms face, and shows a wry understanding of how bureaucracies should be expected to act. The irony is all the stronger, then, that he aims to "make the FDIC and FSLIC act more like private insurers" (p. 100) as though such a project were not contrary to all we know about bureaucratic imperatives.

AN unusual feature of the volume, reflecting

its origins in a reform-minded conference, is the inclusion of a list of policy recommendations accepted by a majority vote of the conference's eighty participants. Like the essays, the recommendations reflect a moderate free-market outlook. As interesting as the recommendations themselves is the inclusion of dissenting statements by unsatisfied participants. Some dissenters take a more radically *laissez-faire* line. The representatives of the smaller banks and the thrift industry, on the other hand, indicate clearly the special-interest opposition to free-market reform. True to the role of small banks in originally promoting FDIC insurance as a way to subsidize their competition for deposits against larger, sounder banks, the spokesmen for the Independent Bankers Association of America and the United States League of Savings Institutions sharply dissent from proposals to limit the scope of deposit insurance. Not surprisingly, they also oppose a recommendation of benign neglect toward banking mergers and acquisitions, and the thrifts' spokesman protests recommendations to eliminate line-of-business and geographic restrictions on banks.

This is a useful and informative volume. In focusing on moderate reforms the authors no doubt intended to avoid being unrealistic about what is attainable through the political process. There is room for disagreement, however, on the question of which ideal is more realizable and which more fantastic: a *laissez-faire* monetary system, or a government bureau that acts either (1) as if it were a private firm in a competitive market, or (2) selflessly and efficiently according to an academic blueprint. In any event the focus here is on making the best of our bank regulatory institutions rather than on possibilities for doing without them. Even a *laissez-faire* purist will find most of this effort pointed in the right direction.

LAWRENCE H. WHITE

*New York University*

*Money, finance, and macroeconomic performance in Japan.* By YOSHIO SUZUKI. Translated by ROBERT ALAN FELDMAN. New Haven, CT and London: Yale University Press, 1986. Pp. xvii, 218. \$22.50, ISBN 0-300-03387-7. JEL 86-1090

Since the beginning of the 1970s, the Japanese monetary system has experienced various fundamental changes; transition to floating ex-

rates, two oil crises, financial innovation, new electronic devices, gradual deregulation and internationalization. Thus, the basic characteristics of the Japanese monetary system described in *Money and Banking in Contemporary Japan* (Yale University Press 1980, originally published in Japanese in 1974) by the author, have undergone many important changes. In this new book, Yoshio Suzuki describes the recent development of the Japanese monetary and financial system and, at the same time, surveys recent studies on Japanese macroeconomic performance by Japanese academics. In particular, by the Bank of Japan economists who have often been under attack.

Dr. Suzuki addresses the issue of the evolution of the Japanese financial system. The author starts with a description of the historical evolution of the Japanese financial system focusing on the dual nature of interest rates, namely, the coexistence of regulated rates and market-determined rates and indicates that rationales for keeping artificially low interest rates to facilitate investment in export-oriented sectors have been diminishing (Ch. 1). He then looks at several quantities that indicate changes in the pattern of funds. The government sector has shifted from a large borrower, the corporate sector has become a less important borrower, and the role of predominance of indirect finance in the commercial banking sector has diminished (Ch. 2). Japanese monetary institutions are in transition as the result of financial innovations. Dr. Suzuki analyzes the economic factors that promote financial innovation. Such as technological improvement, high interest rates due to inflation, the de-regulation of the Japanese financial market, foreign competition and the increase in output; public debt foster financial innovation and changes in the regulatory framework (Ch. 3). Regulation of interest rates facilitates efficient management of household portfolios and changes the income velocity of circulation. The author attempts to contrast an economy equipped only with direct finance and an economy which only uses indirect finance (Ch. 4).

Part II of this book is devoted to a survey of studies in monetary and macroeconomic performance of the Japanese economy. The author begins with the overall view of the experience with the overall view of the experience with Japanese inflation after the first and

second oil crisis in the international context, sketches the debate on inflation in Japan, and describes the failures and successes in containing inflationary pressure (Ch. 5). He then proceeds to examine various empirical analyses of the relationship between the paths of money, price, and output in Japan (Ch. 6). Here, the reader will find the influence of new developments in macroeconomics such as the rational expectations hypothesis and time-series analysis. Dr. Suzuki and economists in the research institute in the Bank of Japan have experimented with new methods whenever available and wherever applicable, and they have naturally extended their scope to the determination of exchange rates (Ch. 7). Finally, he describes the shift of the intermediate target from interest rates to monetary aggregates, which was symbolized by the announcement of the forecast of M2 beginning in the third quarter of 1978. The operating variable has throughout been the interbank interest rate (Ch. 8). One of his conclusions is, "Japan has been less monetarist in rhetoric than either the United States or Great Britain, but far more monetarist in practice" (p. xiv).

I highly welcome the appearance of the English version of this book for at least two reasons. First, it should update the understanding of the contemporary Japanese monetary system by English speaking readers. Many students of Japanese economy and society are prone to stereotyped views based on the description of the system at a prior period. Just as watchers of Japanese movies may include samurai and ninja, in their image of contemporary Japan, so students may believe Japanese financial market to be characterized by rigid interest rates and quantitative controls. This book is an effective antidote to such misconceptions.

Second, Part II provides several interesting examples for the comparative study of macroeconomic performance between Japan and other industrialized countries. It is interesting to see, in many if not in all cases, that the methodology employed to test a certain hypothesis possesses a kind of robustness in such a way that it may test a similar hypothesis in another country.

Needless to say, there are many questions we would like to ask that are left unanswered in this book. The author treats financial innovation as a process of the evolution of institutions

adapting to economic needs. May we neglect, however, the importance of individual or group political actors who are motivated by the benefits and costs of institutional changes? The shift of deposits to postal savings accounts provides an example of the importance of political interactions. The author admits the failure of monetary control during the first oil crisis, but he talks little about the role and the interaction among those who make economic policy. It may be difficult for an insider to criticize the failure of policy makers including the Bank of Japan. Still is it not possible to evaluate the success or the failure of each policy action beyond relating public debt to "financial socialism" (p. 17)? Also it is not easy to grasp the author's fundamental frame of reference because quite a few different methodologies and theoretical frameworks are used or surveyed. Is it correct to conclude that Dr. Suzuki is more monetarist in spirit than in analysis? In any case, it would have been better if the author had provided an integrated framework within which the many approaches used in Part II could be located.

Despite these comments, I would like to congratulate the author for contributing an important monograph for an international audience. Robert Feldman, the author of another book *Japanese Financial Markets* (Cambridge, MA: MIT Press, 1986), has provided an excellent translation that leans more toward the rigorous conversion of the original Japanese than toward idiomatic English.

KOICHI HAMADA

*Yale University*

### 320 FISCAL THEORY AND POLICY; PUBLIC FINANCE

*United States taxes and tax policy.* By DAVID G. DAVIES. Cambridge, New York and Sydney: Cambridge University Press, 1986. Pp. xiv, 316. \$34.50, cloth; \$10.95, paper. ISBN 0-521-30169-6. JEL 87-0139

Making sense of debates about tax policy is both difficult and important. This book is intended to help lay persons and students, especially advanced undergraduates, understand how the tax system works, what effects it has, and what should be done to change it.

Its range is broad. The book is divided into fourteen chapters, the first and last are on economic and tax policy broadly defined. Separate

chapters take up the personal income tax, the corporation income tax, the payroll tax, the value-added tax, the sales tax, state taxes, and local taxes. Additional chapters concern specific problems or issues: inflation, capital gains, distribution, and expenditure-versus-income taxation. As this list suggests, but does not fully reveal, certain topics are treated several times in different places. The book devotes considerable attention to a subject too often ignored, the administrative costs of taxation.

Unfortunately, the book fails in its principle objectives. It dwells at puzzling length on aspects of the tax system that no longer exist. Thus, it spends five and one-half pages on the issue of inflation-induced bracket creep in the personal income tax, a problem solved by legislation enacted in 1981. It spends several pages describing financial problems in social security solved in 1983. Seven pages are lavished on descriptions of value-added tax proposals advanced by former Senator Russell Long and former Representative Al Ullman, although neither was ever seriously considered.

The book surveys conflicting analyses of how the tax system affects the economy, but gives the reader little or no guidance on how to decide which of the arguments if any is valid. The chapter on the distribution of tax burdens illustrates the problem. This chapter is divided almost equally between descriptions of estimates of tax burdens by Joseph Pechman and Benjamin Okner on the one hand and by Edgar Browning and William Johnson on the other. Pechman and Okner present several estimates of the distribution of tax burdens based on alternative incidence assumptions, but none suggests a high degree of progressivity for the central eight deciles of the income distribution. Browning and Johnson, in contrast, find that the average tax rate of the ninth decile is more than three times that of the second.

In the face of such divergent findings, the nonspecialist reader is entitled to a discussion of why the results differ so widely, which procedures are preferable, and an appraisal of the entire technique of making empirical incidence estimates. What this book provides is two sentences on the source of the differences, and no evaluation of the relative merits of each set of estimates (other than the comment that the Pechman-Okner study is the "most ambitious

tax incidence study of any country" and that the Browning-Johnson study is "more recent"). The book places proper stress on one of the shortcomings of empirical incidence studies based on annual survey data (the fact that payroll, sales, and some other taxes are related more closely to permanent than to annual income and hence that studies based on annual data overstate the regressivity of such taxes), but it pays no attention to other arguably more important issues, such as the failure of these studies to take into account the effect of taxes on pretax incomes.

Here and elsewhere, the book summarizes conflicting empirical results of the current tax system and policy recommendations on changing it. Readers are made aware that economists reach different conclusions, and the author leaves them in no doubt where he stands. But they are given no understanding of the analytical structure of the debate and hence no independent capacity to form judgments.

A final problem is that the book has been rendered obsolete by events. Part of the problem lies at the doorstep of the author and the publishers. Although the book was published in 1986, the bulk of the chapter on social security is devoted to financial problems that were largely solved in 1983 and the book makes no reference to the tax reform debate, which began in 1984. The enactment of the Tax Reform Act of 1986 makes much of the descriptive material on the personal and corporation income taxes of only historical interest.

*Brookings Institution*

*Analyzing redistribution policies: A study using Australian data.* By NANAK KAKWANI. Cambridge, New York and Sydney: Cambridge University Press, 1986. Pp. ix, 293. \$47.50. ISBN 0-521-30838-0. JEL 87-0142

This book offers a comprehensive quantitative study of income distribution and redistribution in Australia disaggregated by socioeconomic and geographical attributes such as sex, age, country of birth, employment, marital status and geographical location. The economic unit is the household; hence, the socioeconomic attributes considered are those of the household head. The data source is the 1975-76 Household Expenditure Survey. Some comparative

analyses are made with other studies of Australian income distribution based on the 1966-68 Survey of Consumer Finances and Expenditures, and the income surveys conducted by the Australian Bureau of Statistics in 1968-69, 1973-74 and 1978-79.

The first part of the book presents a thorough discussion of the conceptual problems encountered when dealing with the measurement of income distribution, inequality and welfare. It is a balanced appraisal of the pros and cons of the choice of individual, family or household as the income and expenditure unit. The author also discusses another contentious issue, i.e., the choice of the time unit of measurement. At this point, it becomes clear that the optimal time length is not invariant with respect to the choice of the income unit. The author makes a cogent comment on the limitations of the life cycle as the time unit over which income should be measured.

Given the choice of the household income unit, the book discusses the household-equivalent scales used in Australia and explains the one used to account for the demographic structure of this income unit.

The second part deals with some of the basic issues in the measurement of income inequality, redistribution, and equity. It presents a compact review of a selection of income inequality measures and their corresponding equity and welfare interpretations. This reviewer disagrees with some observations and interpretations of the Gini index taken uncritically from the income distribution literature of the last sixteen years. On page 65, the author states that the "Gini index attaches more weight to transfers near the mode of the distribution than at the tails," and on page 71 he adds that the Gini index "is extremely insensitive to redistribution of income at the lower end of the distribution." The former claim originates in an unwarranted extension to the continuous of a theorem deduced by Gini for a finite set of income units with different income levels. The latter stems from a misplaced interpretation of a well-known property of the Gini index, i.e., given the size and the mean income of a population, an income unit transferred from a richer to a poorer member, without changing the income rank of the population, reduces the inequality in proportion to the number of eco-

nomic units with income in between these two members.

Contrary to what would be expected a priori, the asset and net worth shares of the lower income intervals in the 1966-68 Australian Survey of Consumer Finance and Expenditures (Tables 3.4 and 3.5) are higher than their corresponding income shares. Besides, the asset share of the open-ended income interval is also higher than the income share. This is an invitation to carry on a thorough inquiry in search of a meaningful explanation.

The third part presents a detailed quantitative estimate and analysis of Australian household income distribution. It deals with the following income concepts: (1) original income; (2) gross income (original income plus government cash benefits); and (3) disposable income (gross income minus income tax paid). For each one of these the author calculates several measures of income inequality. He also calculates an index of the progressivity of government taxes and transfer payments.

This reviewer disagrees with the assumptions underlying the author's policy conclusions. For example, observing that the Australian data do not support the proposition that the share of employment income decreases with income, the author states that "it would appear, then, that any policy that increases the labor share of the functional distribution may increase rather than decrease the inequality of total household income" (p. 83). The labor share is an endogenous macroeconomic variable mainly determined by institutional structures, economic growth and modernization. These determinants, together with educational and financial structures and investment in R&D, condition the stock and composition of human resources and assets, and consequently the level of income inequality. In an open economy, redistributive policies of taxation and transfers have a limited impact on inequality.

The fourth and last part of this book deals with the measurement of welfare and poverty. The author follows the innovative path opened by Amartya Sen's axiomatic approach (Sen 1974) to the measurement of social welfare, enriched with the author's own past contributions. Social welfare is measured as a function of a nonseparable household utility function, a welcome departure from the utilitarian approach that

works with identical household utility function. Sen's and Kakwani's contributions purport to capture the sense of deprivation resulting from an economic unit's awareness of the number of those units with higher income (Sen's approach) or their corresponding income (Kakwani's approach). Given past discussions of the Gini index' implied social welfare, it is highly relevant to observe that both approaches lead to the derivation of a measure of social welfare that is a strictly decreasing function of the Gini index. This is an exceptional property of this index that is absent in other alternative measures of income inequality.

The author's welfare function is applied to estimate Australian social welfare corresponding to the 1975-76 distribution of original, gross, and disposable income, respectively. These estimates are disaggregated by quintile shares. The first quintile and sometimes the second quintile present negative social welfare estimates for the two positive (0.5 and 1) values of the parameter accounting for the household sense of deprivation arising from his interpersonal income comparison. These negative social welfare estimates call for a socioeconomic interpretation.

This book contains an exhaustive quantitative study of the 1975-76 Australian household income distribution. It surely provides the most detailed investigation of the Australian tax-transfer system so far attempted. It will become a standard reference for applied economic research on income distribution and some of its methodological discussions will stimulate further theoretical inquiry.

*The rich, the poor, and the taxes they pay.*  
By JOSEPH A. PECHMAN. Boulder, CO: Westview Press, 1986. Pp. xvi, 317. \$40.00. ISBN 0-8133-0376-1. JEL 87-0471

By almost any standard, the Tax Reform Act of 1986 must be ranked as one of the most sweeping changes in the American income tax since the introduction of the tax in 1913. As

remarkable as the political coalition that made the Act possible was the collection of strange bedfellows that provided the intellectual rationale for reform. On the one side were conservative supply-siders pushing low marginal tax rates and on the other a group of liberals who supported broadening the income tax base. Most prominent among the latter group was Joseph Pechman, a tax expert who for over two decades has deftly balanced the roles of scholar and Washington insider.

This is a collection of articles and papers published by Pechman over the past twenty years, some in collaboration with others. The first two articles summarize his findings regarding the incidence of taxes in the U.S. using a data set combining tax return information with Census household surveys. The heart of the volume is composed of 11 articles on comprehensive income taxation and major structural issues in income tax design. Articles follow on revenue sharing, the negative income tax, and social security. The last three articles present comparative information on the tax systems of other industrialized countries. Although there is some repetition, there is remarkably little overlap. For some purposes, such as some tax policy courses, this book may well dominate Pechman's *Federal Tax Policy*, since it combines the structural discussion in that volume with useful material on incidence and foreign tax systems.

Pechman's most important contribution to positive analysis in this volume is the calculations of the distribution of tax burdens by income class. If one accepts the Harberger view that the corporation income tax is borne by owners of capital, his calculations imply that the U.S. tax system as a whole is slightly progressive. Alternative incidence assumptions make some difference, but not much. In the last 20 years the tax system has become more regressive due to increased reliance on payroll taxes and the declining importance of corporate taxation, a trend that he notes in other developed countries as well. In contrast, transfer payments are decidedly pro-poor in distributional impact.

A second of Pechman's lasting contributions to positive analysis is his analysis of the impact on effective tax rates of departures from a comprehensive tax base. He captures this impact in one of the memorable graphs of tax analysis—

a hill of increasing rates whose steepness is eroded by numerous exclusions, exemptions, deductions, and credits. The inevitable result is that the income tax is not nearly so progressive as the statutory rate schedules would suggest.

However, Pechman does not stop at positive analysis. He is an unabashed advocate of base broadening and progressivity. The very term "erosion" of the tax base is pejorative, suggesting the illegitimacy of exclusions and deductions, but it has become standard public finance terminology. True to the tradition of Stanley Surrey and Richard Musgrave, Pechman is as uncompromising in his criticism of tax incentives as he is in his condemnation of reliance on regressive taxes such as the payroll tax. Reflecting on the lack of progression in the tax system, he states,

It may be that, at some distant future date, the rich will have enough income to satisfy not only their own needs, but also to help relieve the tax burdens of those who are less fortunate. In the meantime, the tax system will continue to disgrace the most affluent nation in the world. (p. 29)

One is tempted to read any collection of this sort as a kind of intellectual autobiography, revealing fixed convictions as well as changes of heart. For the most part this volume reveals a dogged consistency in attention to structure and incidence. For example, Pechman repeatedly criticizes departures from economic income in the form of abbreviated useful asset lives and the exclusion of state and local bond interest, income from IRAs, and fringe benefits.

If there are shifts in emphasis, one may be an increased emphasis in Pechman's later work on simplicity itself as an objective in tax reform. There also appears to be less patience with "subsidy-type" deductions, such as the charitable deduction, whose main objective is to encourage certain kinds of behavior. The only personal deductions for which he expresses much sympathy are those for unusual or unavoidable expenses such as medical care, and even then he favors large floors to limit revenue loss. But by 1984 he seems to have become a hard-liner: "Every item removed from the tax base reduces revenue and probably makes the income tax less fair" (p. 59).

The final section on foreign tax systems pro-

vides fascinating comparative material for students of the American tax system. We find, for example, that the Japanese tax system epitomizes some of the worst sins in the Pechman canon—rampant tax incentives, resulting in base erosion significantly more pronounced than in the U.S. He also provides a careful comparison of effective tax rates in Britain and the U.S.

One occupational hazard in Pechman's line of work is the danger of becoming outdated as soon as the tax law changes. In this case Pechman appears to be the victim of his own effectiveness in making the case for fundamental tax reform. Because the book was published in 1986 there is no mention of any of the sweeping changes brought about in the 1986 law—thus the volume takes on, more than it might otherwise, the character of historical manuscript rather than current policy analysis. One wishes to see Pechman's assessment of the new law, although one can infer what it might be. For example, the continued nontaxation of capital gains at death remains an important deficiency of the tax law. Fortunately, analytical work from this scholar continues to come forth unabated, so we need not treat this volume as his last word.

CHARLES T. CLOTFELTER

*Duke University*

*Studies in state and local public finance.* Edited by HARVEY S. ROSEN. National Bureau of Economic Research Project Report series: Chicago and London: University of Chicago Press. Pp. viii, 236. ISBN 0-226-72621-5.  
JEL 87-0149

In the past decade there has been a resurgence of attention among public finance economists to the political economy of federalism. This renewed interest has coincided with two sets of events. The first is the Reagan Administration's New Federalism program, whose focus has been the shift of responsibility for public programs from the federal to state and local governments. The second is the emphasis in the public finance literature of the 1980s on the application of competitive market models to the study of the behavior of "competitive" local governments. The current emphasis is in marked contrast to the focus on the federal government as a raiser of revenues in the public

finance literature of prior decades. Whether the current emphasis on decentralization and competition is appropriate is an important subject for academic debate, and one about which our empirical knowledge is quite spotty.

This volume makes an important contribution to our understanding about the state and local public sector. It includes six papers (and six brief comments) that were delivered at a National Bureau of Economic Research conference on state and local public finance in June, 1984. The conference was organized by Harvey S. Rosen, who was also responsible for editing the volume. The topics of the papers vary, and involve differing degrees of theoretical and empirical sophistication as well. But, when viewed in light of the larger set of work that the National Bureau has supported in the area of state and local public finance (through conferences and working papers), they add to our knowledge in a number of important ways.

The first paper, "Explaining the Yield Spread between Taxable and Tax-exempt Bonds: The Role of Expected Tax Policy," by James M. Poterba, represents a fine example of how finance theory can be combined with careful empirical analysis to yield interesting conclusions. Poterba examines the yield spread between long-term taxable and tax-exempt bonds, and concludes that the market is segmented, with different investor groups interested in long-term bonds, and others in short-term. The striking policy implication is that recent attacks on the growth of short-term borrowing by local governments have been inappropriately placed. Poterba's results may need to be reexamined in light of the major changes brought about by the Tax Reform Act of 1986, but the framework makes this a relatively straightforward effort.

The second paper, "An Empirical Examination of Municipal Financial Policy," by Roger H. Gordon and Joel Slemrod, is the most provocative and stimulating one in the book. Gordon and Slemrod find substantial support for the view that local governments have taken advantage of opportunities for arbitrage created by the fact that governments have the option of raising money by borrowing at the tax free rate of return, or by raising taxes which reduces private savings. At the same time, these governments can earn investment income at the tax-

ee rate. Despite the many legal restrictions at limit many governments' ability to arbitrage, Gordon and Slemrod show that relatively poor communities tend to rely more on bond financing than wealthy communities, a result that is consistent with their arbitrage theory. The next two papers look at the empirical applications of some particular state and local government policies. In "Property Taxes and Firm Location: Evidence from Proposition 13," Michelle J. White uses the natural experiment created by the passage of Proposition 13 in California to study business location decisions. She finds that property taxes play a significant role in the location of retailing and service firms, but not manufacturing firms. In "Welfare Effects of Marginal-Cost Taxation of Motor Freight Transportation: A Study of Infrastructure Pricing," Kenneth A. Small and Clifford Winston provide empirical evidence that suggests that the introduction of a nationwide program of marginal cost pricing for heavy highway vehicles will result in a major welfare gain. The paper by Daniel R. Feenberg and Harry S. Rosen, "State Personal Income and Sales Taxes, 1977-1983," utilizes some of the data that have been collected and analyzed as a part of the National Bureau's state and local public finance project. Feenberg and Rosen's paper shows the incredible heterogeneity in tax structures that exists among the fifty states. Whether it is due to what extent these differing structures are due to economic (as opposed to political and historical) motivations remains an interesting, largely unanswered question. In an excellent concluding paper, "Education, Welfare, and the 'New' Federalism: State Budgeting in a Federalist Public Economy," even G. Craig and Robert P. Inman develop a general analytic framework for evaluating the effect of federal grants on state and local governments. Unlike most earlier work which has been highly aggregative, Craig and Inman look intently at education, welfare, other expenditures, and revenues. The empirical portion of the paper provides strong support for the view that, if enacted, the New Federalism program will lead to reduced government spending on social programs such as welfare and education. All in all, the papers are of unusually high quality, as are the brief, but useful set of comments on each. With interesting and careful

empirical work in this area still an undervalued commodity, the editor and the authors should be commended for their valuable contributions.

### 400 International Economics

#### 430 BALANCE OF PAYMENTS; INTERNATIONAL FINANCE

*Casino capitalism*. By SUSAN STRANGE. Oxford and New York: Blackwell, 1986. Pp. vii, 207. \$24.95. ISBN 0-631-15026-9. JEL 87-0504

Ever since the relative tranquility of the fifties and the pre-Vietnam sixties was replaced by the turbulence of the seventies and eighties *Casino Capitalism* has been an apt label for advanced capitalist economies. When a position in a batch of principal-only mortgage securities can cost a firm as well disciplined as Merrill Lynch about a quarter of a billion dollars on literally the turn of a card, the economic order's resemblance to a gambling den becomes striking. Furthermore when exchange rates and financing terms emulate a yo-yo, as they have during the past fifteen years of floating exchange rates, with serious consequences for jobs, prices, asset values and investment, the gambling den is unsavory.

The flavor of concerns that should have been central to Strange's volume was captured by Keynes in a passage in *The General Theory* that is part of the currency of every economist:

Speculators may do no harm on a steady stream of enterprise. But the position is serious when enterprise becomes a bubble on a whirlpool of speculation. When the capital development of a country becomes a by-product of the activities of a casino, the job is likely to be ill done. (p. 159)

The implication of Keynes' comment, and therefore of the title that Strange appropriated, is that speculation and efficient investment—capital development—are inversely related.

It follows that a volume on *Casino Capitalism*

needs to begin with a serious consideration of the determinants of investment in capitalist economies with sophisticated and ever evolving financial structures. Although in the beginning of the book some awareness of the relation between speculation and efficient investment is evident, Strange does not examine closely how the capital development of capitalist economies was affected by the financial evolution of the past decades. What she does do is present in a discursive and somewhat journalistic fashion the development of the international financial structure in recent years as well as a partial review of some interpretations of the import of financial arrangements.

In spite of her approach the volume is useful. Economists, especially those who are comfortable wearing the blinders of neoclassical theory, tend to believe that the evolution of markets and institutions results mainly from the utility and profit seeking behavior of units. To this Strange offers the useful antidote that "a monetary system cannot work effectively unless there is a political authority . . ." (p. 25), i.e., contracts need to be enforced. Therefore the outcomes in both the short and the longer runs are the joint result of decisions by market participants and authorities. Furthermore, economic evolution leads to shifts in the balance of power between markets and states.

This insight helps explain how the Bretton Woods system broke down. The "chaos" that Strange now finds in the international monetary regime is imputed to key decisions and nondecisions, mainly by the United States, both early on in the postwar period and after 1971. Her main point is that domestic concerns dominated decisions in the United States both when the United States acted and when it did not. As a result havoc was played with the order needed for world economic stability.

I would have liked to report that Strange offers a coherent view of the evolutionary processes that have transformed (and continue to transform) the international economy since Bretton Woods, but I cannot. Her basic premise that evolution results from the interplay of market and authority is a unifying concept that is potentially powerful. This potential power is vitiated because Strange suffers from a common British addiction, which is to blame the United States for all that goes wrong, at the

same time never holding it responsible for things going well.

It is evident that the world's financial markets have become more fragile and the volatility of rates and instruments has increased. This combined with the irresponsibility and ignorance of governments has adversely affected many national economies. However there was nothing in U.S. economic policy or in the evolution of financial markets that determined that Mexican nationals would literally steal the nation's oil enterprise blind or that Argentina's junta would stash away billions.

The continuum between flight capital and portfolio diversification and the issues this raises is completely absent from Strange's analysis. The mess to which she continuously refers is in good part due to the attractiveness of assets in the United States for international portfolios; this was a factor in the disastrous run up of the dollar as the growth of trade literally forced the authorities to liberalize markets. Strange is not happy with fluctuating rates, but she does not examine the impact of portfolio choices upon exchange rates as a means of explaining why the fluctuations are far greater than the theoretical arguments had indicated. The impact on trade balances of the overvalued dollar that resulted from portfolio choices has reduced the United States to a hat-in-hand giant, dependent upon the favors of trading and investing partners.

Beggar my neighbor is a useful term that describes the behavior of economies that maintain domestic employment and profit levels by devices that depress profits and employment of their trading partners. Keynes' scheme, for a sterile international asset for settlement purposes that the banking authorities of countries with substantial international asset positions would *have* to accept if they persisted in maintaining surpluses, was an attempt to make beggar-my-neighbor policies obviously foolish. In today's global financial market nationals of countries that beggar the United States acquire dollar earning assets, so that such behavior seems to have a positive payoff and therefore is not obviously foolish.

Strange seems to despair of bringing order out of the chaos she sees. Because her view does not encompass portfolio choices she does not recognize that the task is easy in principle

though difficult in execution: order will replace turbulence when surplus economies that have substantial foreign assets, at present Germany and Japan, are forced by the international arrangements to become deficit countries on their trade accounts.

Professor Strange has been ill served by the lag between the time her thinking for this book was fixed and the time this review is being written, for her integrating premise that the United States is dominant is now obsolete. Nevertheless her message that an analytical system needs to integrate politics, institutions, authority and markets if it is to be useful in helping us understand how systems behave and evolve is valid and important. It survives the gaps in analysis, the chronic blaming of the United States, and even her exasperating errors. She was not well served by her editors: for example Frank H. Knight wrote *Risk, Uncertainty*, (not Certainty) and *Profit*. The New Deal's NRA was the National Recovery (not Rehabilitation) Administration, and Felix Royahntan is at Lazard Freres, not Salomon Brothers.

## 600 Industrial Organization; Technological Change; Industry Studies

### 610 INDUSTRIAL ORGANIZATION AND PUBLIC POLICY

*The bigness complex: Industry, labor, and government in the American economy.* By WALTER ADAMS AND JAMES W. BROCK. New York: Pantheon Books, 1986. Pp. xiii, 426. \$22.95. ISBN 0-394-54721-7. JEL 87-Q525

In this lively but polemical book, Adams and Brock point to severe deficiencies in the economic performance of U.S. big business, and the issue with both right and left wing views the appropriate public policy response. On what they refer to as the "Darwinian" perspective of the right, espoused by economists of the Chicago school and fervently embraced by the Reagan administration, government efforts to curb or reverse the growth of bigness are inevitably counterproductive, since attained size and power in free markets reflect superior economic efficiency. From the left or "socialist" point of view, the government

must play an active role in some sort of industrial policy, or tripartite *dirigisme* with industry and labor, to strengthen and revitalize the economy in response to the challenge of world competition.

According to Adams and Brock, both Darwinians and neoliberals make the same fatal errors in attributing the rise and continued predominance of big business in this country to its superior economic performance, and in accepting the corollary proposition that antitrust is an outmoded and harmful public policy concept.

To dispel the "quintessential myth . . . that industrial giantism is the handmaiden of economic efficiency and consumer welfare" (p. xii), Adams and Brock examine efficiency at three levels, considering first operating efficiency, or cost of producing a given product, then dynamic efficiency, or innovation in both products and manufacturing processes, and finally social efficiency, or the desirability of the combination of goods and services produced. The record of big business, they conclude, has been deficient at all three levels. Abysmal performances by the steel and automobile industries weigh heavily in their indictment.

The founding fathers' and Adam Smith's views on economic power and its political control are examined and found inadequate for today's needs, leading to a lengthy discussion of the crucial role of antitrust in promoting competition and controlling private business power. Existing law dealing with collusive conduct is considered effective, provided it is enforced rigorously. But the courts' emphasis on intent and the need to show conduct aimed at monopolizing are not fully consistent with the economic view of monopoly as a structural problem of market power. The law is quite ineffectual in dealing with oligopoly where overt collusion cannot be shown. Finally, antitrust has failed to halt a "general trend toward increased concentration" (p. 204) by merger, because of indifference by the Reagan administration, but more fundamentally because the need to show a lessening of competition or tendency toward monopoly in a narrowly defined relevant market hamstringing the law in an era of conglomerate merger.

Alternatives to antitrust are reviewed and found wanting. The authors note with approval

the deregulation of structurally competitive industries such as airlines and trucking in the wake of disillusioning experience with regulatory commissions. But they warn that while economic deregulation promises great benefits, social regulation to assure public health and safety in the face of market failures remains necessary. Governmental support of big business through such devices as import quotas, subsidization, and bailouts of large firms in financial distress is almost always rationalized by contending that the weakening or collapse of a major industry or large firm would lead to increased unemployment, deterioration of the balance of payments, a weakening of national defense, or some other harm to the public. But in every instance discussed the benefit was found to have redounded to private rather than public interests. Confrontation between two economically powerful entities, such as big unions bargaining with big firms, or major contractors negotiating with Defense Department officials, is found to lead to coalescence of power rather than to Galbraithian countervailing, to the detriment of the consuming or taxpaying public.

The authors conclude with a set of "illustrative rather than exhaustive" policy recommendations in the areas of mergers and takeovers, foreign competition, deregulation, the wage-price spiral, defense contracting, and public bailouts, all designed to promote economic decentralization and all "integrally linked with antitrust as mutually reinforcing elements" (p. 378).

This book is and deserves to be evaluated as an essay in advocacy, aimed at a far wider audience than readers of the *Journal of Economic Literature*. For economists, however, it is unduly long on argumentation and horror-story anecdotes and corresponding short on balanced analysis.

Members of the Chicago school who have defended big business and supported current corporate takeover tactics are depicted as seeing "no need to examine the facts or amass voluminous evidence. . . . Logic indicates that it must be so. No need to investigate further" (p. xii). Notably ignored in this depiction are Harold Demsetz's and Sam Peltzman's striking but controversial empirical analyses of productive and innovative efficiency and the varied

supportive and contradictory findings of subsequent studies, as well as a number of investigations of the effects of takeovers on subsequent market performance of the firms' common stocks and thus of the social efficacy of the market for takeovers originally posited by Henry Manne.

Virtually all recent industrial organization work is ignored. Because of an "overemphasis on the mathematical-econometrics approach," Adams and Brock assert, the current breed of economists, regardless of school or persuasion, "have tended to ask themselves questions that can be analyzed with their new techniques. . . . They play games they find amusing, rather than contemplate issues that are crucial and pressing" (p. 14). The "new" industrial organization of the past decade, with its penetrating critiques of both the Darwinian and the neoliberal views, is thus dismissed, as are the varied findings of a number of sophisticated econometric studies drawing on data from the Federal Trade Commission's recently discontinued Line of Business Program.

In sum, economists currently working in the field of industrial organization—including, ironically, those who share the authors' concerns and support their policy prescriptions—take a bit of a bum rap in this book.

WILLIAM L. BALDWIN

*Dartmouth College*

*Who profits? Winners, losers, and government regulation.* By ROBERT A. LEONE. New York: Basic Books, 1986. Pp. xiii, 248. \$17.95. ISBN 0-465-09183-0. JEL 86-1181

This lucid book has an ambitious goal: "to show how an understanding of the competitive effects of government policy can contribute both to better decision making in the private sector and to wiser public policy" (p. 5). Toward this end, fully half of the book illustrates the ways in which regulatory policies affect the competitive positions of firms in an industry. Understanding the often complicated consequences of governmental policies can contribute to the success of firms in competitive industries. Understanding these consequences and the reaction of sophisticated firms also enables public sector managers to formulate appropriate and successful policies. The remainder of the

book is dedicated to exploring the processes of policy formation. Understanding the determinants of regulatory policies may provide firms with important opportunities to structure their competitive environments.

The motivations for this endeavor are clear. Government regulation plays an important role in determining the fortunes of contemporary commercial enterprises. Recognizing this role can be quite valuable to a firm contemplating an important decision, such as locating a plant, selecting among production technologies that vary in the proportion of fixed to variable costs, or augmenting or retiring capacity. Moreover, it is abundantly clear that regulatory policies are not formulated or implemented in a vacuum. Processes of policy formation and implementation can present important strategic opportunities to firms. Acknowledging that firms have a legitimate and potentially constructive role to play in these processes may also help policy makers achieve their goals.

The methodological foundations for understanding how government affects business are reflected in the postulate of the "iron law." The iron law states that "every act of government, no matter what its broader merits or demerits for society at large, creates winners and losers within the competitive sector of the economy" (p. 3). This postulate is illustrated repeatedly with reference to the actual, and often surprising, consequences of regulations. These references are taken from materials used by Professor Leone and others in teaching what might be referred to as "Public Sector Strategies" courses at Harvard's Kennedy School of Government and the Graduate School of Business Administration. Most of these cases are quite rich and provide useful reading for almost any practitioner or scholar interested in the effects of government on business. Recognizing the existence of the iron law is a prerequisite for effective private sector strategies when government matters.

Understanding that the iron law holds is, of course, not sufficient for successful private or public sector planning. One must also know how government regulation matters: consequently, the next four chapters of the book identify the *ways* in which it affects the competitive positions of firms. Chapter Three presents

an extremely cogent overview, with explicit references, of the variety of ways regulation affects costs. This chapter also illustrates the folly of the corporate strategy of reflexively opposing all proposed regulations. In some cases, regulation may serve to overcome coordination problems among firms in the adoption of less costly production technologies. Leone offers the fluorocarbon ban as an example. In other cases it may affect firms' costs differentially, altering their relative competitive positions. Thus, public sector activities can provide important strategic opportunities to firms whose private sector decisions have been less than successful. This chapter also lays the foundation for the policy analysis of the later half of the book by illustrating that the way such regulations generate "winners" and "losers" is likely to have some bearing on the political support for them.

Chapters Four and Five are particularly useful for private sector managers contemplating the effects of regulation (or potential regulation) on their competitive positions. These chapters illustrate quite vividly how these effects are dependent upon the cost structures and the capacity decisions of the firm. The importance of knowing about potential government behavior when making such decisions is made clear. Chapter Six summarizes the analysis of Chapters One through Five with implications for the development of corporate strategy when public policy matters. The lessons are developed within the context of a case study of the behavior of major domestic automobile manufacturers in two important policy areas: the congressionally mandated corporate average fuel economy (CAFE) standards and voluntary import restraints.

The second half of the book, beginning with Chapter Seven, presents a "model" of the governmental (political and regulatory) process as applied to competitive markets. This model consists of a series of aphorisms most of which are illustrated by anecdote. For instance, to paraphrase the author, the policy process thinks in terms of distributional (wealth) consequences. Tangible losses count more than potential gains. Political actors are sometimes more concerned with the *process* of regulatory intervention than its *outcome*. Bureaucratic institutions are, in contrast to private institutions,

organized in a bottom-up fashion where many of the decision-making powers reside in the technically proficient career civil service professionals. The sequential nature of policy formation is salient. Many political actors are myopic and risk-averse. And private sector managers themselves may have an inordinate preference for status quo regulatory policies (Ch. 7). These generalizations, while most assuredly unsettling to those who study political processes on a full-time basis, may prove helpful to those with less experience or interest in the American governmental system.

Chapters Eight through Ten utilize the political model developed in Chapter Seven to illustrate sensible, and not so sensible, ways in which private sector managers can participate in the economic policy process. Chapter Eight contains the *don'ts* of corporate participation in the policy formation process. For instance, responses to regulatory proposals tend too often to be ideological, technocratic (failing to recognize the political determinants of the regulatory process), reactive and ad hoc. These reactions also frequently fail to consider the differential effects that regulations may have on firms in the same industry (often working to some firms' advantage) and fail to recognize that the regulatory process and its demands are constant fixtures of any firm's operating environment and will remain long after contemporary regulatory exigencies diminish. Chapters Nine and Ten develop, once again by explicit reference to particular cases and examples, the *dos* of corporate participation in the policy process. Since these are the obverse of the *don'ts*, I will not bother to recount them here. Chapters Eleven and Twelve provide a summary of the book's lessons aimed at public and private sector managers, respectively.

This book provides an illuminating introduction to the interactions of government and business and is especially aimed at novitiates (undergraduates or MBAs) or casual observers (the business press) of this process. I would strongly recommend it to such readers. It is too general, however, to be of practical value to players in this complex arena or to researchers in the politics and economics of regulation. This is particularly true when considering the political prescriptions contained in the later chapters. However, Professor Leone has provided a co-

gent illustration of the complex relationships between government and business in the modern American economy.

#### 630 INDUSTRY STUDIES

*The changing structure of the U.S. economy: Lessons from the steel industry.* By ZOLTÁN J. ÁCS. Foreword by CHARLES P. KINDLEBERGER. New York; Eastbourne, Eng.; Toronto and Sydney: Greenwood Press, Praeger, 1984. Pp. xvii, 246. \$39.95. ISBN 0-03-001092-6. JEL 86-1191

The steel industry has often been the favorite choice of economists looking for an example of concentrated structure, administered pricing, and lagging innovative performance. Until recently, the industry exhibited all these characteristics. From the turn of the century until the mid-1960s, competition was almost absent from the American steel market. When challenged by imports, the big steel producers bought time by means of successful protectionist campaigns. Such lobbying required political support from the United Steelworkers Union and, to achieve this, managers were obliged to offer generous labor contracts and avoid mass layoffs associated with the shutdown of obsolete plants. As a consequence, the companies' competitive position deteriorated further during the 1970s.

The combination of import restraints and high production costs of the established producers facilitated the entry of new domestic competitors into the steel market, the so-called minimills. These firms, which made their first sporadic appearance in the late 1950s, melt scrap in electric furnaces. In contrast, the big "integrated" producers smelt iron ore in huge blast furnaces (at least in their principal plants). The small efficient scale of the minimills makes for easy entry. However, due to the large optimal size of hot strip mills, the small steel companies are confined to the production of bars, rods, and light structurals and unable to enter the much larger market for sheet products (although a breakthrough is now on the horizon).

The minimill invasion of selected steel markets rarely ensued in a competitive battle; for the most part, the big mills simply retreated.

## Book Reviews

focusing their attention instead on the nation's capital and their two main preoccupations, import restraints and tax relief.

Professor Acs chose this encounter between a young competitive "flexprice" sector and a rather stodgy corporate "fixprice" sector as a model for deriving more general insights into the ongoing structural transformation of the American economy. In the first part of his book he cements his analysis with a heavy dose of theory by drawing on the writing of such authors as Marshall, Kalecki, Berle, Means, Mills, Scitovsky, Sylos-Labini, Bain, Baumol, Simon, Williamson, Marris, Eichner, and Dirlam, Kaplan, and Lanzilotti. He concludes that the fixprice policy of large corporations is primarily a function of long-run costs and investment needs and that, due to the absence of a mechanism for periodic rejuvenation, the corporate sector is vulnerable to attack by the younger firms of the competitive sector.

Part Two begins with a detailed description of the two major segments of the American steel industry, i.e., integrated producers and minimills. This is followed by an analysis of the integrated firms' policies with respect to prices, dividend payout, diversification, and investments. Professor Acs finds that steel prices are rigid in the short run and "seem to move with long-run normal costs, with labor costs being more significant than raw material costs" (p. 122). He also corroborates the view, held by many observers of the steel industry, that there was no basis for the persistent complaints of steel company executives concerning lack of investment funds for plant modernization.

In the third and final part of the book, the author discusses the circumstances surrounding the presumed decline of the entire corporate sector of the United States and suggests measures to transfer resources, especially labor and capital, from the corporate to the competitive sector. Among his specific recommendations are income support and retraining of displaced workers (with greater participation by local governments), abolition of the corporate income tax, and more bank loans to medium and small enterprises. He disapproves of the use of trade restraints and "industrial policies" for the purpose of preserving or stimulating domestic industries. In passing, he dispenses harsh criticisms for the various economic policies of past

Democratic administrations and mostly praise for the policies of the present administration.

Are there lessons to be learned from the steel industry? Certainly, the industry is not so unique that no parallels can be drawn with other industries. For instance, its history demonstrates that prolonged absence of competitive pressures severely impaired the ability of managers to react to changes on both the demand and supply side of the market. Another lesson is that inefficiency in a basic industry has a broader impact on the economy than inefficiency in a consumer goods industry. Thus, in the case of steel, it resulted in hardship for many customer industries. Fabricators and manufacturers saw their international competitiveness deteriorate because their foreign rivals were able to buy cheaper and often better steel. Eventually, many American companies were compelled to quit making certain steel-containing components and import them instead or to move entire production units abroad.

The author's "lessons," enumerated in the introduction, are rather disappointing, in addition to being flawed. The steel industry did not lose its international competitiveness in the 1970s but two decades earlier; minimills do not generally employ more "high" technology than integrated producers; the market share of minimills in 1984 was not 40 percent but approximately 16 percent; this is not the first time in 100 years that small steel firms have been able to compete with large ones (small specialty steel producers have done so for many years); large size is still a significant advantage (as in producing sheet products); and no policies have recently been suggested to expand the steel industry. The only valid lesson in the list is that, in a shrinking market, government assistance can do little to stem the decline of an industry.

In view of the dramatic improvements in efficiency that have been achieved by the integrated firms since 1981, one might also take issue with the author's conclusion, already referred to, that the corporate sector lacks a mechanism for rejuvenation. The mechanism that set off those drastic cost-cutting efforts was intensified competition (which, moreover, coincided with sharply falling demand). Suddenly, in a period when import protection had been temporarily removed, the integrated producers were able to do many of the things which they

had previously maintained were not feasible, as, e.g., the restructuring of their untidy empires (via wholesale elimination of obsolete capacity and unprofitable product lines), pressure on the labor union to make concessions concerning wages, fringe benefits, and work rules, as well as the accelerated adoption of modern technology. The fact that costs were reduced by about 15 percent within three years and that, nevertheless, prices frequently fell far below production costs during this period also casts doubt on the author's previously mentioned dictum regarding the inflexible behavior of steel prices and their relation to "normal" costs.

In addition, the author is wrong when he implies that investments by the steel industry were inadequate to maintain modern facilities. Because of this presumed shortage of investment funds, he suggests that the flow of investments could have been increased by raising prices in the 1960s (an odd suggestion given the competitive situation at the time) or by means of suspending dividend payments and diversification programs. The problem, however, was not lack of investment funds but poor investment decisions. From 1960 to 1980, American steel producers invested considerably more, per ton of capacity added or replaced, than their Japanese rivals. Unfortunately, their insistence on nursing along many marginal installations and scattering their funds over an excessive number of duplicate facilities yielded very low capital efficiency. They spent a lot of money and had little to show for it in terms of internationally competitive plants.

Despite its blemishes, the book has merits. Professor Ács often demonstrates a great deal of resourcefulness in his attempt to develop a theoretical interpretation of recent institutional and organizational changes affecting the American manufacturing sector.

## 700 Agriculture; Natural Resources

### 710 AGRICULTURE

*Agricultural household models: Extensions, applications, and policy.* Edited by INDERJIT SINGH, LYN SQUIRE AND JOHN STRAUSS. Baltimore and London: Johns Hopkins University Press for the World Bank, 1986. Pp. xi, 355. ISBN 0-8018-3149-0. JEL 87-0256

The papers presented in this volume examine a variety of interesting issues related to agricultural household behavior. They cover topics such as the impact of agricultural pricing policy on nutritional status, the effect of yield risk on consumption and labor supply, and the effects of price changes on income distribution and foreign exchange earnings. Together they provide an indication of how far agricultural household models have come, and also an indication of what areas require further research.

The volume is divided into two sections. The first provides an overview of the relevant theoretical, empirical and policy issues. It consists of two chapters written by the editors and an appendix written by John Strauss. The first chapter sets out a simple model of agricultural household behavior, which is elaborated upon and extended in Strauss' appendix. The model is used to demonstrate the fact that household production and consumption decisions can be treated recursively if markets are complete, households are price-takers and commodities are homogeneous. Specifically, production decisions will be made independently of consumption and leisure decisions; consumption and leisure decisions will be affected by production decisions through the effect of farm profits on income. The chapter also provides brief reviews of estimation issues, empirical results and possible extensions of the simple model. The second chapter presents a discussion of several methodological issues, including the validity of the recursive model, problems associated with mul-

market analysis and data requirements for the estimation of agricultural household models.

The second section contains nine case studies that cover a diverse set of topics and use data from a wide range of countries. Each case study represents an extension of the simple model developed in the first section. The first paper in the second section, by Inderjit Singh and Lakshman Subramanian, extends the basic model to allow for more than one crop, and uses linear programming models to characterize the production side of the model. The next paper, by Strauss, uses data from Sierra Leone to estimate a recursive model of farm production and consumption. Strauss' goal is to trace the effects of changes in prices and technology on household nutrition levels.

Mark Pitt and Mark Rosenzweig follow with an extremely good study of the effects of food price changes and health program interventions on the health and profits of Indonesian farmers. They incorporate a household health production sector into a basic agricultural household model, and investigate the relationships between consumption and health and between health and profits. They find that although the health of farmers significantly affects the amount of labor supplied, health does not appear to affect farm profits. This implies that either markets are well-functioning, and prices provide support for the use of a recursive model. The next chapter, by Farrukh Iqbal, is one of only two in this volume which consider the intertemporal decisions of agricultural households. Iqbal estimates interest rate and borrowing equations for agricultural households in India.

Because he assumes that interest rates will depend on household characteristics and on household size, the recursive nature of the basic model must be abandoned. His results suggest that borrowing demand may be fairly responsive to interest rate changes.

The next two papers attempt to incorporate general equilibrium considerations into the standard model. Victor Smith and John Strauss use microsimulation to examine the effects of product price changes and wage changes induced by product price changes on production, consumption and total calorie consumption. In a paper by Avishay Braverman and Jeffrey Hammer explicitly includes general equilibrium effects. Paying careful attention to data

and computational requirements, they construct a simple general equilibrium model of a multimarket agricultural sector. Estimates of the model (based on Senegalese data) are used to simulate the effects of changes in product and input prices on such things as the distribution of income across regions, agricultural production, and foreign exchange earnings.

The final three papers deal with a grab bag of interesting topics. Terry Roe and Theodore Graham-Tomasi incorporate production risk into a dynamic agricultural household model. Terry Sicular extends the basic household model to examine the production decisions of Chinese farm collectives given the presence of state-imposed quotas and restrictions. Ramon Lopez develops a model which is not recursive because family farm members are assumed to value on-farm and off-farm work differently. He uses Canadian data to test whether a recursive model is valid, and concludes that it is not.

Because this volume contains such a diverse set of studies, anyone interested in this area of economics is sure to find value in at least some of the material presented. It should be noted, however, that the level of quality and degree of sophistication vary considerably across chapters. For example, some authors painstakingly present very simple microeconomic concepts; others present very little discussion of the techniques used for quantitative analysis. Some authors present extremely good information about their data; others provide very little information, making the results difficult to assess. Although this volume contains a lot of useful and interesting information, one will probably want to read some chapters carefully and skim over others, depending on one's interests.

## 800 Manpower; Labor; Population

### 830 LABOR MARKETS; PUBLIC POLICY

*The minimum wage in the restaurant industry.*

By WILLIAM T. ALPERT. New York and London: Praeger, 1986. Pp. xiv, 161. ISBN 0-275-92085-2. JEL 87-0275

The impact and desirability of maintaining a legal minimum wage has been, and will un-

doubtedly continue to be, a widely debated topic for economists and policy makers alike. Restaurant employees were not covered by the minimum wage in the U.S. until 1967, and frequent expansions in coverage and increases in the level of the statutory minimum provide important variation for researchers to exploit. Furthermore, given the low level of wages in the industry it is likely that the minimum wage is a binding constraint for many restaurants. In this short book, William Alpert adds to the voluminous scholarly research on the minimum wage by attempting to identify and quantify its effects on the restaurant industry.

The first five chapters draw largely from secondary sources to review the legislative history of the minimum wage as it applies to the restaurant industry, outline the rapidly changing institutional and demographic features of the industry, and depict the structure of compensation of restaurant employees. This material paves the way for the theoretical and empirical examination of the effects of the minimum wage that is presented in Chapters Six and Seven.

Importantly, Alpert documents that the restaurant industry is in a state of flux. Between 1967 and 1978 the industry added almost two million employees, becoming the largest employer among two-digit industries. Any disemployment effects of the minimum wage must therefore have affected the growth of the industry. Furthermore, this time period witnessed unprecedented growth in chain restaurants and a concomitant decline in traditional restaurants. Changes in the industry structure were accompanied by changes in the demographic composition of restaurant employees: restaurant employees have become increasingly more female, younger and more likely to work part-time hours. Given the rapid changes and new developments in the industry, it is unfortunate that Alpert's research primarily pertains to years prior to 1979.

The theoretical basis for the study is quite simple. The imposition of a minimum wage above the market clearing level gives cost minimizing employers an incentive to substitute capital for labor, substitute skilled labor for less skilled labor, scale back the size of the restaurant, reduce nonwage compensation, and implement new labor saving technology which might lead to an increase or decrease in the

skill level of employees. Of course, employers can also fail to comply with the law since the penalty for noncompliance is minimal. Following the technique developed by Orley Ashenfelter and Robert Smith (1979), Alpert estimates that approximately 45 percent of covered employees who were earning less than the minimum wage continued to earn a subminimum wage after the law was enacted. Noncompliance is widespread.

Unlike most previous studies of the impact of the minimum wage which narrowly focus on economy-wide employment effects for younger workers, Alpert's study has the virtue of addressing a multitude of avenues in which the minimum wage can influence a narrowly defined industry. He relies almost exclusively on quarterly time series data to estimate the impact of the minimum wage on employment, fringe benefits, wage dispersion, the wage level, restaurant failures, productivity and sales. The major findings are: 1) an increase in the minimum wage has a statistically insignificant effect on most fringe benefits; 2) an increase in the minimum wage is associated with a decline in employment, although I find it interesting that the employment-minimum wage elasticity that Alpert finds for the restaurant industry is substantially smaller than is generally found for the economy as a whole (for a survey see Brown, Gilroy and Kohen 1983); 3) the minimum wage has reduced wage dispersion in the restaurant industry somewhat and increased the level of wages.

In what I consider the weakest section of the book, Alpert attempts to estimate the total amount of restaurant employment that was foregone due to the minimum wage. The basic approach is to use quarterly data spanning the years 1967 to 1978 to fit a linear regression of restaurant employment relative to population on the coverage weighted minimum wage relative to the average manufacturing wage, a time trend, and other controls. Alpert next uses the fitted regression model to estimate that the 600 percent increase in the restaurant minimum wage relative to the average manufacturing wage that occurred between 1967 and 1978 reduced restaurant employment by some 250,000 to two million jobs.

I find the results of this exercise questionable. The linear model seems implausible in this in-

stance, and Alpert does not present alternative results to support the robustness of his findings. Moreover, theoretical considerations and empirical evidence suggest that the level of coverage and the minimum wage have differential effects on employment; Alpert's specification constrains coverage and the minimum wage to have equal effects. Finally, the relevant hypothetical for the current policy debate is the effect of a 10 to 20 percent increase in the minimum wage on employment, which Alpert's analysis suggests would only have a modest negative effect on employment in the restaurant industry.

As is the case with most government interventions in the labor market, there are advantages and disadvantages to the minimum wage. Alpert's book elucidates many aspects of the debate over the minimum wage by concentrating on its quantitative effects on the restaurant industry. However, given the severe data limitations and uncertainty in the estimates, I would advise readers to view Alpert's findings with a healthy dose of skepticism.

*The new Keynesian economics: Unemployment, search and contracting.* By JEFF FRANK. New York: St Martin's Press, 1986. Pp. xvii, 283. \$27.50. ISBN 0-312-56822-3. JEL 87-0283

This book seeks to be two things to many people. It is primarily an exposition of some central themes in macroeconomics, including traditional Keynesian and neoclassical models, search theory and contract theory, with an emphasis on the connections between these approaches. In addition, Jeff Frank wishes to make the case that asymmetric-information contracting and monopolistic competition together provide a basis for Keynesian models with solid microeconomic foundations. The potential

readership thus includes both students and practitioners. This is an ambitious undertaking for a moderately-sized volume, and it is perhaps not surprising that Frank's first aim is better served than his second.

Part I, comprising five chapters, considers traditional macroeconomic models. After a very brief nod to the stylized facts, Chapter 1 presents a short history of macroeconomic theory. The next three chapters build the Keynesian and neoclassical approaches market by market: Chapter 2 sets out neoclassical labor market theory, and then amends it to the Keynesian (fix-price) case where firms perceive sales rations; Chapters 3 and 4 discuss the loanable funds and money markets. Chapter 5 considers adjustment processes: Frank discusses fix-price models and the Phillips curve, concluding that these do not provide a satisfactory basis for Keynesian models.

While Part I covers standard material, it does so in a clear, careful and appealing manner, making this a useful supplement to the (frequently inferior) treatment in intermediate macroeconomics texts. Students might have difficulties, though, relating such texts to Frank's analysis, given his decision to work in terms of a loanable funds market and his neglect of aggregate supply (due to the fix-price approach). More discussion of these relationships would have been useful.

Part II investigates how more complete analyses of the labor market may improve the models developed thus far, with the ultimate aim of demonstrating Frank's "fundamental thesis . . . the case for contracting in explaining macroeconomic fluctuations" (p. xv). The first two chapters address efficient search (including equilibrium business cycles and policy ineffectiveness) and contracting models. The author emphasizes that, with risk-neutral agents, contracting generates the same employment level as efficient search when placed in the same environment, but can achieve this outcome by involuntary layoffs.

Chapters 8 and 9 explore inefficiencies in these models. When workers search for jobs sequentially, firms need only pay workers their reservation wage, and hence the "last" firm pays a wage equal to the value of leisure. By backwards induction, this becomes the equilibrium wage, implying, in turn, an inefficiently low

level of search. This suggests explicit and implicit contracts as means for firms to commit to wages; asymmetric information, meanwhile, may render first-best contracts infeasible. Frank also discusses staggered/indexed contracts. Finally, he sets up his model of "equilibrium recessions," driven by monopolistic competition and asymmetric information, in Chapter 10.

Chapters 6 to 9 are also valuable. They include a clear presentation of most of the findings of search and contract theory of interest to macroeconomists. A pedagogical strength of the book is that the author uses simple, intuitive examples that strip these models to their essentials. In Chapters 6 and 7 this works particularly well. The exposition becomes less clear in the later chapters, because Frank varies his assumptions in an attempt to balance simplicity and generality. Occasionally, also, he pays insufficient attention to assumptions that are not innocuous, such as that of risk-averse firms in the asymmetric-information setting. It is an unattractive feature of such models that firms tend to shed risk to workers; this deserves more discussion.

The final chapter is the longest, and sits uneasily with the other material. The author is no longer concerned with survey and synthesis, but instead presents original research; as such, the analysis probably belongs elsewhere. In Frank's model, risk-averse price-setting firms face two possible levels of aggregate demand (with known probabilities). Workers cannot observe aggregate demand, so incentive-compatibility requires layoffs in the bad state. Frank shows that there exists a degree of firm risk aversion such that the low level of demand is self-fulfilling.

The "coordination failure" literature, to which this chapter is a contribution, is still in its infancy, and the exact roles of imperfect competition and labor market imperfections remain incompletely understood. The risk that a simple model may mislead, therefore, is greater than in earlier chapters, and readers could be forgiven for being wary of Frank's conclusions. Such scepticism is justified. He is wrong to state, for example, that "monopolistic competi-

tion on its own . . . cannot lead to equilibrium recessions" (p. 235). There exist well-specified models where imperfect competition generates multiple equilibria indexed by the level of economic activity (for example, Walter P. Heller 1986). Frank's fundamental thesis remains unproven.

This is not to say that Frank's model is uninteresting: it shows that imperfect competition and contracting may interact in nontrivial ways, and it generates unemployment, rather than the underemployment of most other models in this literature. But it has some unappealing features that are discussed only briefly—notably the assumed unobservability of aggregate demand and the exogenous probability of recession. It is also unfortunate that labor (with no leisure value) is the only nonproduced good, since Frank wishes to explain equilibrium recessions by firms' having no incentive to change prices and set in motion real-balance effects. This argument seems peculiar in a model where real-balance effects are excluded by construction.

I have two final comments on the scope of this work. Frank takes it as self-evident that neoclassical theory cannot adequately explain macroeconomic fluctuations. Although I am sympathetic to this view, Frank should perhaps have acknowledged real business cycle theories, which argue the contrary position. And I take issue with the title, which promises more than this volume delivers. While Frank is right to highlight search, contracting and coordination failures, he makes no mention of efficiency wages, near-rationality/menu costs, or the hysteresis literature, to mention just some other potential ingredients of a "new Keynesian economics."

#### REFERENCE

- HELLER, WALTER P. "Coordination Failure under Complete Markets with Applications to Effective Demand," in *Equilibrium analysis: Essays in honor of Kenneth J. Arrow*. Vol. II. Eds.: WALTER P. HELLER, ROSS M. STARR AND DAVID A. STARR. Cambridge, MA: Cambridge U. Press, 1986.

*The myth of market failure: Employment and the labor market in Mexico.* By PETER GREGORY. World Bank Research Publication series. Baltimore and London: Johns Hopkins University Press for the World Bank, 1986. Pp. viii, 299. \$34.50. ISBN 0-8018-3343-4. JEL 86-1240

This book examines the functioning of the labor market in Mexico from 1940 to 1980. Four pages at the end discuss events after 1980, mostly a period of economic decline in Mexico, using the labor-market framework developed earlier in the book. The theme of the examination is captured in the title, that rather than being underutilized, "a growing labor force has been absorbed in productive employment" and "the terms of employment have shown a steady improvement throughout the course of forty years" (p. 268). The evidence presented portrays an upward trend of real wages during the period examined. The author concludes: "Much of the qualitative evidence suggests that a large part of the urban unemployment may be frictional in character" (p. 267).

Professor Gregory recognizes that these findings are at variance with conventional analysis and the bulk of the book presents data and interpretations to support this heterodox conclusion. One of the key conclusions is that the decline in participation rates of teenagers and young adults has gone hand-in-hand with increases in school enrollments; schooling, he argues, was substituted for labor-force participation. He attributes the drop in participation of the elderly in the labor market to improved social security and increased family income. Open unemployment, as measured in Mexico, was less than four percent throughout the period examined and the author questions the techniques used to measure what is often depicted to be underemployment affecting 45 to 50 percent of the economically active population. His argument is that most part-time employment is voluntary, particularly among technical and professional groups and women. He also argues that much of the labor that appears to be surplus in rural areas divides its time between agricultural and nonagricultural work, depending on the relative opportunity cost.

There was much internal migration in Mexico during the forty years examined, particularly

to urban labor markets. Here again, the conclusion is that the system worked well. Most migrants found jobs with short delays, within days or a few weeks, and at wages higher than in rural alternatives. Professor Gregory's data also show that upward mobility over time was commonly achieved by migrants. He is more tentative about the impact on the wage level in Mexico of emigration to the United States.

There are significant policy implications to the author's conclusions. He asserts that President José López Portillo's misreading of Mexico's employment picture led to the fostering of accelerated but unsustainable economic growth in the years between 1978 and 1981 and that this contributed to the economic crisis with which Mexico has had to cope during the last five years.

Professor Gregory is most proficient in marshalling his data and persuasive in interpreting them. Nevertheless, the reader is left with some doubts. For example, the 1980 census gives the absolute size of the labor force as 22 million. Professor Gregory makes or accepts various adjustments to this figure and bases his analyses on a 1980 labor force of 20 million. The 1980 census, by general consensus, was deficient, but it is not fully clear even after reading the technical passages of the book that the case is iron clad for dropping two million persons from the labor force. If, in fact, the census data are reasonably correct, much of the subsequent analysis of underemployment and disguised unemployment is flawed.

When choices must be made on which data to use or which interpretation of data is correct, Professor Gregory tends to dismiss the conventional view in favor of his own. He rejects the proposition that conditions for the most disadvantaged workers may escape detection by census takers because in this instance he does not wish to discount the relevance of census data (p. 46). He reasons that the large number of hired agricultural laborers in some regions is best explained not by the availability of surplus labor but by the opportunity cost of landholders and their families who are able to accept off-farm labor because of their greater endowment of human capital (p. 129). He is willing to accept the conclusion of a survey with a small, non-scientifically selected sample made at two points in 1982 as evidence that most streetwork-

ers, such as bootblacks and auto watchers, prefer that to regular work (pp. 95-96).

Professor Gregory has presented a professionally competent analysis, supported by a mass of data, that the Mexican labor market did work efficiently during the forty years of consistently high rates of economic growth. While the analysis is impressive, I am not completely persuaded that his thesis is correct. One reason is that he is an advocate, a persuasive and sophisticated one, but still a consistent advocate of those explanations that fit his thesis rather than others that have merit. Another reason for my reservation is uncertainty that his manipulation of official data necessarily leads to correct figures. Even if they do not, however, this may not negate all the conclusions, such as on the trend of real wages. After reading Professor Gregory's book, I will never again accept without question the conventional explanations of the failure of the Mexican labor market during the halcyon years of sustained economic growth.

SIDNEY WEINTRAUB

*University of Texas at Austin*

*Saving free trade: A pragmatic approach.* By ROBERT Z. LAWRENCE AND ROBERT E. LITAN. Washington, DC: Brookings Institution, 1986. Pp. xi, 132. \$22.95. ISBN 0-8157-5178-8. JEL 87-0288

With the possible exception of the exercise of monopoly power in world markets, there is no economic case for protectionism. Almost all legitimate goals pursued through direct intervention in trade can be better accomplished by other policies. Quantitative restrictions, which eschew price incentives, lessen competition at home, and beg for the exercise of market power by foreign suppliers, are in turn the worst form of protectionism. Set against this economic case are recurrent provisions of relief to industries injured by import competition, an inevitable outgrowth of representative democracy and economic nationalism. Congress has recently debated no fewer than six proposals to expand the scope and automaticity of escape clause relief through protection; and quantitative restrictions (e.g. steel, cars, textiles) are seriously discussed and sometimes put in place.

For "pragmatists" Robert Lawrence and Robert E. Litan, the reconciliation of economic logic

and political reality lies in legislative procedures which accommodate protectionist demands in the least onerous fashion. Their timely and compact analysis contains four substantive chapters. The (il)logic of protectionism is the thrust of Chapters II and IV, which respectively survey the issues and critique specific current legislative initiatives. The realistic alternative, in their view a modification of the existing programs for escape clause relief and trade adjustment assistance, is the centerpiece of Chapters III and V. Here, respectively, the historical performance of these programs is reviewed and the proposed modifications are forwarded.

The case for free trade is made in nontechnical fashion. It is documented with industry case histories and is especially fresh in speaking to popular rationalizations for protection. For example, it is argued that: i) tradable sectors are not peculiar in the risks they face nor in the mobility of their factors; thus, equity is not promoted by supplementing the Federal safety net with special relief from import competition; ii) historically and at a very high cost to consumers, tariffs and quotas barely bolster employment (because they reduce effective protection in sectors using the protected good as an input) and barely sustain existing jobs (because protected industries usually retrench and relocate anyway); iii) current account imbalances reflect an intertemporal consumption decision over which trade intervention has small and uncertain leverage; and iv) protection as a tool of industrial policy and conditional on an approved adjustment plan promotes cartelization and substitutes central planning for individual initiative. Readers will find an understatement at points (e.g., wages and profits in tradable sectors already compensate for the undiversifiable risk of world markets) and an overstatement at others (e.g., optimal tariff arguments are overlooked and intertemporal consumption paths can respond to the real income consequences of protection under full employment). But such subtleties of the high tower would be a diversion. From the ground level, quotas are bad policy; and protection is not the way to save jobs, improve the current account, or lower costs in threatened sectors.

Rather, protection is aid. This was the blatant, original premise of the escape clause and trade adjustment assistance (TAA) programs

which were to provide temporary relief under specific circumstances in (implicit) exchange for a broad based lowering of trade barriers. These programs, we learn here, have evolved with mixed success. The former has proven strengths as a framework: International Trade Commission rulings have been relatively isolated from partisan politics and special interest pressures, can establish uniform eligibility requirements and reporting standards, and have generally led to relief that is both temporary and tariff-based. The latter has potential strengths as a tool: it targets aid to displaced workers; does so in subsidy form; and, if continued after workers relocate, need not seriously disrupt resource reallocation. Lawrence and Litan's specific proposal would combine these strengths by making TAA automatic and prohibiting the use of quantitative restrictions upon a finding of injury under the escape clause. Among other innovations, the proposal aims to increase relief through lenient antitrust standards for injured sectors; and earmarked revenues from new tariffs and old quantitative restrictions converted to tariffs would amply fund a TAA generous by historical standards. As before the analysis is stark and, for this reader, convincing: a given volume of aid through the proposed channel would be cheaper and better targeted than through the existing programs or piecemeal legislation, and protection would be provided within a framework that does not mask its purpose.

However, some issues remain. Lawrence and Litan's second-best solution is not free trade. Even if the new program diverted protectionist demands completely, tradable sectors would be over-insured and we have yet to devise a lump sum subsidy which would not impede resource reallocation in the face of a trade shock. The new proposal would retain tariff relief, on which funding would depend: tariffs are far from a first best source of revenue and tool of subsidization. The original escape clause and TAA took high tariffs as the status quo and made tariff reductions a (potential) Pareto improvement. The pragmatist, in effect, takes trade barriers in response to adverse shocks in international markets as the status quo. By making escape clause relief more legitimate and accessible—especially if legislators and their constituents view the new relief as a poor substitute in scope and form for the old—we run the risk of in-

creasing protectionist demands. For example, merger leniency for industries facing strong foreign competition seems sensible, even innocuous. But for just this reason it may be perceived as a small favor and no substitute for quota protection.

More generally, *Saving Free Trade* is bound to provoke debate on the comparative social costs of alternative aid frameworks and on the precise nature of the political constraint which motivates its second best vision. By initiating this debate with sound arguments accessible to a wide audience, this book is a welcome contribution. It demands a reading by students and makers of U.S. trade policy.

*The end of economic man? Custom and competition in labour markets.* By DAVID MARSDEN. New York: St. Martin's Press, 1986. Pp. ix, 278. \$27.50. ISBN 0-312-25069-X.

JEL 87-0289

Because many of the issues addressed by labor economists are also the subject of study by researchers in industrial relations and industrial sociology, there have been regular exhortations over the years for greater cooperation between the scholars in the three disciplines. More often than not, these exhortations have taken the form of specialists in industrial relations and industrial sociology admonishing economists for the inadequacies of their models which are denounced as having assumptions or yielding implications in flat contradiction to what is observed. In some instances these criticisms have merit and yet they have not had a significant impact on research in labor economics, something that is itself of interest to students of scientific methodology.

This book written by an industrial relations scholar is in this same critical tradition: in the search for a multidisciplinary approach to labor market problems, the author presents a selective though wide-ranging commentary on research in labor economics. We are taken on a six chapter tour of models of implicit contracts, transactions costs, trade union behavior, discrimination, internal labor markets, segmented markets, and social custom. I found some of the author's accounts of French research on earnings and employment especially interest-

ing. For the most part, he avoids the most common failing of scholars from other disciplines describing economists' models, that of drawing caricatures of these models. His readiness to contrast each model's central features with labor market practices, institutions, and outcomes is admirable and, occasionally, he is able to register some telling criticisms. However, some of the author's expositions of economists' research (such as that on implicit contracts and discrimination) are terse or idiosyncratic and those readers not already familiar with these models may well have difficulty in grasping their logical structures.

Though he doesn't quite express it this way, Marsden identifies the principle of *substitution* as the central concept in the way economists reason about labor market behavior: there is substitution in the form of alternative workers a firm could hire, alternative employers for whom individuals could work, alternative technologies firms may use, alternative ways in which individuals may satisfy their wants, and so on. These (albeit limited) substitution possibilities are embodied in the objective functions of individuals and firms. Marsden argues that this principle of substitution operates to the degree economists posit in only two types of labor markets: those for unskilled or casual workers; and those where skills are fully transferable across firms. He implies that these together characterize a small number of labor markets in the modern economy. The substitution principle is not a useful way to organize our thoughts, Marsden suggests, in markets for firm-specific skills. For such internal labor markets, the methods of industrial relations research and sociology are more useful and these emphasize the role of institutions and social customs not as manifestations of conventional supply and demand or bargaining forces, but as impediments to or opponents of these forces. Marsden views firm-specific internal labor markets as the norm where the behavior of such markets defies the sort of optimizing-type considerations that are the hallmark of economic analysis.

Economists will be hard pressed to detect the differences between Marsden's views and those usually expressed by industrial relations researchers. If there are important differences, it would have helped had they been identified

thize with his view and, indeed, certain game theoretic models provide a formal characterization of the role of custom, reputation, fairness, and other such considerations in affecting labor market outcomes. However, most economists will regret that such a small fraction of this book is taken up with developing the author's alternative view and with illustrating its analytical abilities. (Only a part of the last chapter is devoted to an outline of the research strategy Marsden advocates.) It is true that Marsden's central purpose is not to spell out and describe his proposed research method, but rather to critique certain contributions to labor economics research. However, without a convincing demonstration of the insights to be gained from this alternative research strategy, the book is unlikely to have much influence on labor economics thinking. What its impact will be on research in industrial relations and industrial sociology, I cannot say.

*Alternative systems of business organization and of workers' remuneration.* By J. E. MEADE. London, Boston and Sydney: Allen and Unwin, 1986. Pp. x, 144. \$24.95. ISBN 0-04-331112-1. JEL 87-0290

This monograph is an extended exercise in what may be called comparative institutional economics. It specifies a simple one-sector model of the economy that involves product differentiation and increasing returns to scale on the supply side, and that is closed on the demand side by the stipulation that all income is consumed. The equilibrium and comparative static behavior of the model are examined under a number of different assumptions on the institutional structure of the firm. The objective is to study the nature and the extent of the relationship between economic outcomes and business organization.

This kind of exercise has been performed with significant effect by Martin Weitzman in his writings on the macroeconomics of the "share" economy (Weitzman 1984). His basic theme is that in the long run of a share economy firms will equilibrate at positive excess demand for labor. This is because the share economy by definition is one where the cost per unit of labor falls as employment rises. A "small" deflationary shock will therefore leave the share econ-

omy at full employment, even in the short run.

Meade presents his own work here as wholly inspired by that of Weitzman, although he has demonstrated previously a considerable interest in closely related areas. In this book he seeks to build on Weitzman's work by considering in a unified framework the comparative institutional implications of a capitalist wage economy, a capitalist share economy, an egalitarian labor-managed firm and a discriminating labor-capital partnership.

Meade's main contribution is in the exposition of "Discriminating Labour-Capital Partnerships" given in Chapter VI. This picks up on a major problem with Weitzman: the fact that in his share economy firms can dilute the value of the individual worker's "share" of the firm by increasing employment. This feature is central to Weitzman's argument but is not plausible as a statement of what workers are likely to accept in practice. It is precisely these income-dilution effects from additional employment that distinguish the egalitarian labor-managed firm from the capitalist wage firm. Meade forsakes egalitarianism, suggesting instead a factors-remuneration scheme based on a common dividend payable to the owners of capital and labor share certificates. The capital certificates would be much like current stock-market share certificates. The labor certificates would be nontradable and would be surrendered only if the employee left the business voluntarily; in the case of layoff the worker would retain her claim on the firm's income stream. The point of the scheme is that it allows the firm to discriminate between workers in its remuneration contracts; marginal workers can be hired, by the issue of shares, in a way that does not reduce income to the existing worker. Further, since the shares of both capital and labor have equal claim on the same dividend pie a substantial harmony between the interests of the two factors is introduced: for example, the potential adverse consequences for capital investment found in a Weitzman-type share scheme can be avoided.

Of course this scheme is based on negation of the principle of equal pay for equal work. And it has a number of other negative connotations. Nonetheless the implications of such a discriminating contractual form that puts labor and capital on a partnership footing are interesting and are thoughtfully discussed. Fortunately

this chapter relies hardly at all on the mechanics of the more formal preceding chapters and so is directly accessible to the reader.

There are also a number of interesting themes elaborated in the penultimate chapter (Ch. V) where the author's version of the "Capitalist Sharing Economy" is presented and analyzed. In particular the demonstration that the share economy is vulnerable to entry by firms offering fixed-wage contracts unless the individual firms' share parameters are flexible in the short run is important in considering the survivability of a share economy. The careful distinction made between the fixed-wage component and the share component of a worker's remuneration is valuable, as are some remarks on the ramifications of a share system for firms' capital investment decisions. Beyond this, Weitzman's basic theme is corroborated in the context of this simple general equilibrium model of the economy.

This reader must report some disappointments, however. The book is often hard to read, with completeness rather than clarity being emphasized in the presentation of results. This is particularly true in the first half where the basic model is presented (Ch. II), and where the "Capitalist Wage Economy" (Ch. III) and the "Non-Discriminating Labour Co-operative" (Ch. IV) are analyzed. Very little of the material in these chapters is novel; it serves only as a backdrop for the final two chapters discussed above and as such could have been much more succinctly and tellingly presented.

WEITZMAN, MARTIN L. *The share economy: Conquering stagflation*. Cambridge, MA & London: Harvard U. Press, 1984.

*Women and equal pay: The effects of legislation on female employment and wages in Britain*. By A. ZABALZA AND Z. TZANNATOS. Cambridge, New York and Melbourne: Cambridge University Press, 1985. Pp. ix, 140. \$29.95. ISBN 0-521-30188-2. JEL 87-0585

In 1970 Britain enacted the Equal Pay Act which became fully implemented at the end of 1975. Also at the end of 1975, the Sex Discrimination Act became law. Over the same brief legislative period, the relative wages of

tion, caused important changes in company industrial-relations programs as well as in union policies and practices, especially in manufacturing industries.

The authors emphasize that management policies and actions have been the main driving force in American industrial relations during the 1970s and 1980s (p. 48). And they explain how a company's industrial relations goals and programs can influence top-level strategic business decisions. The introduction of labor goals and programs into the process of top-level decision making increases the need for revision of the theory of the firm (as proposed by Herbert Simon, Richard Cyert, and others) for use in industrial relations analysis.

Application of this broad framework shows that more studies and analysis are necessary before a body of generalization and testable propositions can be developed and used for predictive purposes. Part of the problem is that U.S. industrial relations have varied so much across industries, companies, unions, and settings. Different types of industrial relations often operate in the same area and even in different individual plants of large corporations.

In a final chapter, the authors deal with the implications of developments during the past decade for company managements, union leaders, and public policy including legislation. However, they shun any prediction of the shape of American industrial relations in the future, pointing out that major developments in the past have seldom been foreseen.

Whether developments during the past decade in all three tiers are substantial and widespread enough to constitute a new industrial relations system with staying power is a question that is being seriously discussed. Critics point out that union-management cooperation has a long and spotty history, arising under the stimulus of stressful conditions and tending to decline and disappear as the generating forces abate. Most of the material for making a judgment on the issue is contained in this book.

Kochan, Katz, and McKersie have made a major step forward in the systematic analysis of industrial relations in this country. They provide a good basis for further progress in theory and practice in the field.

*The fourth wave: California's newest immigrants.* By THOMAS MULLER AND THOMAS J. ESPENSHADE WITH DONALD MANSON, MANUEL DE LA PUENTE, MILDRED GOLDBERGER AND JUAN SANCHEZ. Washington, DC: Urban Institute Press, 1985. Pp. xvii, 217. \$19.95, cloth: \$12.95, paper. ISBN 0-87766-349-1. JEL 86-0932

Between 1970 and 1983, over two million foreigners immigrated to California (almost half of them to Los Angeles County). Asians accounted for about one-third of the total, but over two-fifths came from one country: Mexico. Thomas Muller, the principal author of this book, and Thomas Espenshade (who played Rimsky-Korsakov to Muller's Mussorgsky, finishing the manuscript when Muller took on another assignment) analyze the features and effects of this immigration. Chapter 1 summarizes the history of immigration to the U.S., with special reference to California; Chapter 2 presents an overview of the characteristics of recent immigrants to California and compares them with those of U.S.-born residents; Chapter 3 provides a detailed description of California's Mexican immigrants.

The bulk of the book's economic analysis—which focuses on Mexican immigration to California and its effects—appears in Chapters 4–6 and discusses impacts on the labor market, effects on state and local government expenditures and revenues, and other demographic, economic and fiscal effects. After examining estimates of projected levels of labor supply and demands in the late 1980s and beyond in Chapter 7, the book concludes in Chapter 8 by considering likely future trends in immigration to California and the potential consequences of alternative immigration policies. Several appendices discuss technical issues, including the results of a poll of California residents' attitudes towards immigration.

On the whole, the authors are sanguine about California's recent experience with immigration, especially its economic consequences. Their relatively upbeat assessment resembles that adopted in another recent work on the same subject (McCarthy and Burciaga Valdez 1986). For example, Muller and Espenshade write (p. 197): "in the aggregate, [the economic and fiscal] effects are probably positive, or at

least not negative, [so] noneconomic issues are likely to become increasingly important in formulating national immigration policy" (which, however, did not seem to be the case when Congress debated and ultimately adopted landmark immigration legislation last year). They conclude that immigration has had negligible if any impact on employment and unemployment rates, even among blacks, and that their results provide little support for the claim that Mexican immigrants "take jobs away from blacks" (see pp. 91-102). Similarly, with the exception of laborers and some other groups at the bottom of the occupational ladder, they do not find much evidence that immigrants (in particular, Mexican immigrants) appreciably depress natives' wage rates (see pp. 109-23).

Immigration's fiscal effects may be one possible cause for concern, however. The authors estimate that, in 1980, the cost of state and local government services provided to Mexican immigrant households in Los Angeles County averaged \$2245 per immigrant household more than taxes received. State government bore most of this burden, which the authors say is primarily attributable to Mexican immigrants' relatively large families and relatively low earnings. However, spread over all households in the county, this deficit is only about \$139 per household. Moreover, the authors probably overstate the immigrants' total cost to government because they use per-pupil (i.e., average cost) rather than marginal cost figures in assessing immigrants' use of the schools (which, in the authors' calculations, is a large part of the total cost of immigrants to government).

All in all, *The Fourth Wave* is a sensible and thoughtful assessment of what has—and has not—been happening in one of the states most heavily affected by immigration, especially Mexican immigration. It is a useful antidote to less careful (and at times regrettably emotional) discussion of a contentious topic. Since it covers not only economic but also social and cultural issues (e.g., crime, schools, family life) and is written in a clear and nontechnical manner, it should appeal to a wide audience.

Unfortunately, the book's appeal to specialists, particularly economists, is likely to be somewhat limited. Partly because of the serious data limitations that hamper virtually all research on immigration, and partly because the

book is (it appears) aimed mainly at nonspecialists, *The Fourth Wave* breaks little new ground in the analysis of the economic effects of immigration. Frequently, the authors attempt to draw inferences about the effects of immigration from comparisons of unadjusted levels (e.g., of employment or unemployment rates) a decade or more apart, with little or no attempt to allow for the effects of factors other than immigration. For example:

The period from 1970 to 1982 was marked by rising rates of unemployment, both nationwide and in California. For all groups in the United States, unemployment rates more than doubled. The smallest increases [in Los Angeles] were for blacks . . . —26 percent for adults and 35 percent for teenagers—followed [for California] by black teenagers . . . In sum, trends in unemployment rates do not provide evidence of sharp job competition between immigrants and blacks. (p. 97)

Comparisons of a similar nature are offered in support of the view that immigration may have retarded wage growth at the low end of the occupational spectrum (pp. 120-22).

To their credit, the authors note that such comparisons do not allow for other factors, operating along with (or in opposition to) immigration, that may also have affected labor market outcomes over the same period (see, e.g., p. 97). Accordingly, they present relatively simple regression analyses aimed at isolating the independent effect of Hispanic immigration on black unemployment rates (pp. 97-101) and black wages (pp. 122-23) using metropolitan area-level data aggregated from the 1980 Census. Neither analysis is particularly compelling. In each case, a measure of black economic status is regressed on a measure of Hispanic representation or Mexican immigration; population change between 1970-80; percentage of area income earned in construction or durable goods; white economic status (either unemployment rate or income) and percentage of blacks age 25 or older with at least a high school education. Arguably, all of these regressors (with the possible exception of the last one) are endogenous to Hispanic immigration; yet none of them will reflect non-Hispanic immigration (e.g., of Asians, which, as the authors themselves observe, has become increasingly important in California). Finally, in the second of the two analyses the dependent variable is black family

income, the use of which seems a less than satisfactory means of assessing whether immigration affects blacks' wage rates.

### 900 Welfare Programs; Consumer Economics; Urban and Regional Economics

#### 910 WELFARE, HEALTH, AND EDUCATION

*The economic emergence of women*. By BARBARA R. BERGMANN. New York: Basic Books, 1986. Pp. x, 372. \$19.95. ISBN 0-465-01796-7. JEL 87-0611

*The Economic Emergence of Women* is a lively discourse on the status of women in the work place and at home, and on the merits and drawbacks of alternative ways in which women might seek to change it. Bergmann sees the status of women at home as both a consequence and cause of their status in the work place. In the work place, she argues:

Women are fenced off from a disproportionate share of what we might call "labor-market turf." As a result, the turf assigned to them tends to be relatively overcrowded. . . . That translates into restricted demand for labor in the women's labor market and lowers the wage levels in the jobs that are filled there. It makes the wages low in the traditionally female occupations. It also lowers the pay of the jobs that women hold in occupations that are mixed-sex and mostly male. (p. 125)

At her verbal best, the author displays a keen ability to show up the flaws in an opponent's position. In explaining one perspective on the occupational segregation of women that is favored by some economists, she writes:

Some economists have used deductive reasoning to deny that occupational segregation could be discriminatory. They point to competitive pressures on employers that, they say, compel them to minimize costs. . . . But even if incontrovertible evidence were presented that competent women were being turned away by an employer,

then governmental intervention still would not really be necessary. The employer in question would, after all, be in the process of committing economic suicide and would not be marring an otherwise discrimination-free labor market for very much longer. (p. 138)

She goes on to suggest:

We see thousands of business failures every year in the United States . . . ; but no one has ever reported seeing a firm that discriminated reduced to ruin by a less bigoted competitor . . . (pp. 138-39)

Commenting in a similar vein on certain hypotheses for explaining intra-occupational female-male pay differentials, Bergmann writes:

Gary S. Becker has conjectured that differences in pay between men and women are in considerable part due to housework differences between the sexes. . . . Women workers, he says, are tired from doing all the family's housework, while men come to their jobs fresh from their rest and recreation. It is hard to believe, though, that female operators of slicing and cutting machines make \$192 and male operators of slicing and cutting machines make \$303 because the males, being less tired, do a better job of slicing and cutting. (p. 123)

From the perspective of substance and a careful treatment of alternative points of view, perhaps the two best chapters are Chapter 7 titled "Fighting Discrimination Through Affirmative Action" and Chapter 8 titled "Achieving Pay Equity." Bergmann begins in Chapter 7 by explaining the basic difference between affirmative action and pay equity measures. She goes on to outline the main affirmative action measures that have been instituted in the United States, beginning with the passage of Title VII of the Civil Rights Act of 1964. She explains what sorts of practices are and are not treated as discriminatory under Title VII and subsequent affirmative action measures, as these have been interpreted by the courts. She provides an interesting perspective on the enforcement of Title VII by the Equal Employment Opportunity Commission.

Bergmann also calls attention to a number of the more important problems involved in implementing affirmative action programs. For instance, she deals in a forthright manner with objections to quotas:

The unstated essence of the complaint about quotas is that the above-average performance of

certain groups (and the below-average performance of other groups) cannot get proper recognition under affirmative action. It could in principle, but in practice, it is admittedly difficult to arrange . . . (p. 171)

Her reply to those who oppose affirmative action because of the reliance on quotas is succinct:

The situation that most justifies affirmative action is where the 'quota' for the excluded group has already been set—by the discriminators—at close to zero. Affirmative action then can be seen as upping an already existing quota into a fairer range. (p. 171)

On a more general level, Bergmann argues that the unfortunate aspects of quotas must be balanced against "the reality of currently operating discrimination, the serious harm that discrimination causes, and the lack of a feasible alternative to deal with it" (p. 171).

In Chapter 8, the author explains the similarities and the crucial difference between wage determination under a pay equity program and wage setting based on job evaluations as this practice is carried out by a considerable proportion of large employers in both the private and public sectors. On balance, she prefers the affirmative action to the pay equity approach to redressing the disadvantaged position of women in the labor market. She explains:

A successful affirmative action program . . . should have the same effect on wages as a well-planned and well-implemented pay equity program. Moreover, affirmative action has added benefits that pay equity reforms lack. Affirmative action allows women workers to have access to jobs they may enjoy and be good at, and it promotes the equality of men and women by casting them as equals on the job. It causes the adjustment of wages through the market mechanism and avoids any disemployment effects. In fact, if affirmative action were proceeding rapidly, a pay equity campaign might be redundant . . . (p. 181)

Bergmann argues that the consequences of sidelining affirmative action programs in the rush to have pay equity measures enacted will be unfortunate. Nevertheless she acquiesces to the judgment that the affirmative action programs that have been implemented so far have done little to improve the wage situation of the majority of women who are working in traditionally female jobs. She concedes that pay equity could help these women in a timely way.

And she does endorse pay equity programs as "properly cleaned-up job evaluation schemes" that provide "a promising methodology for the removal of sex bias from wage scales, one pioneered by business itself" (p. 182).

Like most books, this one has weaknesses as well as strengths. The first chapter draws on too many streams of thought from the literature without providing sufficient background material for an uninitiated reader. There are assertions throughout the book that are not, and some that probably could not, be supported with evidence. The references provided to actual court testimony are valuable, and the inclusion of excerpts from some of this testimony in the text adds considerable interest. The practice of mixing this documentary evidence with observations and experiences reported to Bergmann by some of her students is a dubious asset, however. Also, some of the references to the academic literature do not provide exactly the evidence implied by the context in which these works are cited. For instance, Bergmann writes: "Fewer children have meant that more mothers are in paid jobs, but the effect has been relatively small" (p. 49). She cites our book (Nakamura and Nakamura 1985) as the source of this finding. What we actually found is that children have only a modest impact on the current work behavior of their mothers *after controlling for work behavior in the previous year*. This finding does not rule out the possibility that changes over time in desired or expected family size may have had substantial effects on the training and career development decisions of young women, leading to an upward trend in the proportion of married women with jobs prior to the birth of their children, and to higher employment rates for mothers.

On balance, however, this is an excellent book. The willingness Bergmann displays to compare the likely benefits and injustices associated with imperfect alternatives, without glossing over the drawbacks of the alternatives she prefers, should have an uplifting effect on the level of academic and political debate concerning proposed measures for improving the status of women. The author offers fresh insights and interesting recommendations on public policy for a broad range of topics including the welfare system, the plight of the single parent, the job of the housewife, and the indus-

trialization of housework and child care. She concludes with what she terms a "policy agenda for the sex-role revolution." The book is well worth its modest cost for both those who are actively concerned with the economic and social issues on feminist agendas, and for more general readers.

#### 940 REGIONAL ECONOMICS

*Regional dynamics: Studies in adjustment theory*. By GORDON L. CLARK, MERIC S. GERTLER AND JOHN WHITEMAN. Boston, London and Sydney: Allen & Unwin, 1986. Pp. xxiv, 342. \$39.95, cloth; \$19.95, paper. ISBN 0-04-330354-4. JEL 87-0332

This book seeks to provide a new approach to regional growth, focusing on dynamic adjustment processes. Short-run decisions are viewed as accumulating into long-run patterns of regional growth, income, and employment. Regional investment is volatile and conditioned by immediate past economic events rather than a stable long-run target. This approach is contrasted throughout the book with three other perspectives: neoclassical economic theory emphasizing equilibrium outcomes; cumulative causation theory stressing self-reinforcing growth; and catastrophe models exhibiting smooth short-run growth followed by sudden reversals of investment and regional fortunes. Clark, Gertler, and Whiteman regard distribution as central, including distribution of income, of power, and of uncertainty. They describe regional adjustment as "a process by which a particular social and spatial distribution of uncertainty is created through production" (p. 20). The book's empirical aim is to contribute to an understanding of the transformation of the U.S. regional system since about 1950.

Part I discusses the theory of regional adjustment, and tests a model of regional production for two industries, textiles and electronics, across states and regions of the U.S. Part II

examines the demand for labor, with emphasis on fluctuations and rigidities in local labor markets and the risks of employment loss. Part III focuses on local wages and prices, and Part IV on interregional labor migration, including relationships between capital growth, immigration, and outmigration. The final Part V examines regional capital dynamics, attempting to build a "bottom-up" characterization of the investment process emphasizing past profits and the pre-existing stock of local or regional capital.

The book tends to assume familiarity with the statistical techniques employed (e.g., survival functions, Box-Jenkins techniques, cross-correlation functions, Granger and Newbold causality tests). It also draws heavily on previously published work by the authors, not always smoothly integrated into a cohesive whole, and lacks any concluding section. For both reasons, it will be more accessible to specialists than to the general reader.

The authors are correct to identify serious weaknesses in current theoretical approaches to regional growth. Starting instead from Kaleckian roots, they characterize the process under study as one of capital accumulation. They appear, however, to see only two theoretical alternatives: treating investment and migration as highly volatile and essentially responding to short-run shocks; and positing long-run equilibrium targets of firm or individual behavior. One can, however, conceive of firms as having long-run accumulation objectives which they attempt to realize through pricing, investment, and other strategic behavior, without viewing them as seeking equilibrium targets (Penrose 1959; Shapiro 1981; Steindl 1976). Moreover, characterizing the investment process as a series of responses to short-run shocks, without accounting for the shocks, limits one to description rather than theoretical explanation.

Much of the empirical analysis is posed not in terms of regions, but selected state-industry pairs (e.g., textiles in Alabama) or cities. The patterns analyzed often do not exhibit clear regional variation. The authors thus should make more clear whether the region is now a theoretically meaningful object of study, and if so how to define it. Large-scale firms, which the authors point to but do not really incorporate into the analysis, tend to dissolve the economic regions of the nineteenth century. While the au-

thors' effort to model investment as dependent upon past profitability is an important positive step, its effects on spatial development will depend upon the evolution of firms and the geographical boundaries within which they deploy their retained earnings. In this connection it would be useful to have information on the size distribution and scope of operations of firms in the industries studied.

The empirical results contain some potentially interesting findings, but serious difficulties arise in assessing their representativeness and implications. Textiles and electronics figure very heavily in the empirical work. These are two main industries cited by Massey (1984) and others as recently undergoing restructuring, with spatial consequences that may differ from other industries. The analysis of employment risk is based on only two cities, Dallas and Pittsburgh, which are described as "growing" and "declining" respectively. Pittsburgh, while experiencing considerable economic difficulties, remains one of the leading U.S. cities in corporate headquarters, and has a major research and technology university. The results on page 123, for example, concerning risks of job loss in services and finance, insurance, and real estate might not be found in other northern cities.

In a number of cases the empirical results are fairly inconclusive. For example, in investigating the relationship between capital growth and past profit and wage rates (pp. 311-12), none of the independent variables is significant in more than 30 of the 74 cases (state-industry pairs); in the subsequent investigation of capital intensity the hypothesized negative relationship between the profit rate and capital intensity is found in only 40 of the 74 cases. Moreover, much greater caution should be exercised in inferring causality, rather than simply correlation, from the types of tests utilized (Cooley and LeRoy 1985).

The authors seek to draw policy conclusions

from their findings. They argue that in general gross profits rather than wages determine the demand for labor, and past retained earnings are crucial for capital formation. Consequently, economic development policy should be directed not toward reducing wages, but toward stimulating profits and improving accessibility to finance. In the zero-sum distributional game underlying their approach (p. 128), however, it is not clear how profits are to be increased if not at the expense of wages. A possibility deserving more consideration would be policies to increase productivity, perhaps through restructuring work practices or other technological or organizational changes.

In sum, the book is useful in highlighting the possibility of alternative theoretical approaches to regional growth, and in suggesting avenues for empirical exploration, rather than in presenting a definitive treatment of its subject. One can hope that it will stimulate further research to develop the theoretical and empirical bases for an understanding of regional growth rooted in elements Clark, Gertler, and Whiteman rightly stress as central, including capital accumulation, the role of past profits, uncertainty, and distribution.

# Annotated Listing of New Books

## Editor's Note

Our policy is to annotate all English-language books on economics and related subjects that are sent to us. A very few foreign-language books are called to our attention and annotated by our consulting editors or others. Our staff does not monitor and order books published; therefore, if an annotation of a book does not appear six months after the publication date, please write to us or the publisher concerning the book.

An index to the *Annotated Listing of New Books* will appear at the end of the *General Index* in the December issue.

## 000 General Economics; Theory; History; Systems

### 010 GENERAL ECONOMICS

CH, GEORGE LELAND. *Economics: Analysis, decision making, and policy*. Eleventh edition. With ROBERT FLANAGAN ET AL. Englewood Cliffs, N.J.: Prentice-Hall, [1954 . . . 1980] 1987. Pp. xv, 752. ISBN 0-13-227240-7. JEL 87-0970

An updated version of an introductory textbook emphasizing the working of the major institutions of the modern economy and the way the economy works in dealing with both public and private problems. This edition gives special attention to: macroeconomics, political economics, the modern corporation, international economics, money and financial markets, income distribution and labor economics, and economic growth. Teaching aids include an instructor's manual, student workbook, and test item file. Also available in two paperback editions separating chapters suitable for macroeconomics and microeconomics courses. Bach is at Stanford University. Name and subject indexes.

BECKER, WILLIAM E. AND WALSTAD, WILLIAM B., eds. *Econometric modeling in economic education research*. International Series in Economic Modeling. Norwell, Mass.; Dordrecht and Lancaster: Kluwer Academic; Kluwer-Nijhoff, 1987. Pp. xiv, 255. \$54.95. ISBN 0-89838-218-1. JEL 87-0971

Twelve papers examine the relevance of econometric techniques to economic education. Papers discuss: statistical methods in economic education research; the process of building theoretical models; measuring intervention, interaction, and distribution effects with dummy variables; experimental and nonexperimental approaches to statistical research; measurement instruments; simultaneous

equations estimation; two-stage least squares estimation; the probit model; the analysis of qualitative and limited responses; limited and discrete dependent variable models; simultaneous nonlinear learning models; and the use of Bayesian analysis. The contributors are economists. Becker is Professor of Economics at Indiana University. Walstad is Associate Professor of Economics and Director of the Center for Economic Education at the University of Nebraska, Lincoln. Index.

BLOMQUIST, ÅKE; WONNACOTT, PAUL AND WONNACOTT, RONALD. *Economics*. Second Canadian edition. Toronto; New York; Auckland and London: McGraw-Hill Ryerson, [1983] 1987. Pp. xxxi, 834. ISBN 0-07-549150-1. JEL 87-0972

Starting point of this book is the third U.S. edition of Wonnacott and Wonnacott, *Economics*. For the macro portion the focus is on having students be able to understand public controversies over topics such as national spending and debt, price controls, monetary policy, and exchange rates. Builds up to six controversial questions dealing with the use of fiscal or monetary policies, fixed or flexible exchange rates, fine tuning the economy, inflation and unemployment, adjustments to inflation, and productivity and growth. The micro portion is organized around the themes of efficiency and equity. Deals with both analytical tools and problems of efficiency including regulation, public goods, resources, and problems of international trade and issues of equity such as factor returns, poverty, and inequality. Emphasizes the understanding of current policy issues. More demanding materials appear in appendices, optional boxes, and starred sections. Canadian emphasis includes discussion of international economic relations, high marginal propensity to import, activities of the Bank of Canada, import

prices and wage and price controls in Canada, roles of foreign capital and ownership of natural resources, acid rain, Canadian bank failures, macroeconomic performance, and welfare reform. Substantial changes in this edition have been made in the microsection. Also contains a new section on "Economic Efficiency: Issues of Our Time." Sequencing of the part dealing with income distribution also has been changed. Chapters include key points, key concepts, problems, and appendices. Also available in two paperback editions separating chapters suitable for macroeconomics and microeconomics courses. Blomqvist and R. Wonnacott are at the University of Western Ontario and P. Wonnacott is at the University of Maryland. Study guide is available. Glossary; index.

EATWELL, JOHN; MILGATE, MURRAY AND NEWMAN, PETER, eds. *The new Palgrave: A dictionary of economics*. 4 vols. New York: Stockton Press; Tokyo: Maruzen; London: Macmillan Press, 1987. Pp. 3,500, approx. \$550.00. ISBN 0-935859-10-1, set. JEL 87-0973

A comprehensive dictionary to modern economics containing nearly 2,000 signed entries (by about 900 contributors) focusing on economic theory and doctrine in its varied aspects: analytical, empirical, quantitative, and methodological (including public policy). Aims to provide a thorough account of contemporary economics and to set the account in a historical perspective. Over 700 of the entries are biographical, emphasizing the individual's contribution to economic thought. Biographical entries cover both deceased and living economists who have reached their seventieth birthday by the end of 1985. Entries are arranged alphabetically by subject and include full bibliographic references in the text and cross references at the end; biographical entries also include lists of selected works. The dictionary contains about fifty entries reprinted from the original *Dictionary of Political Economy* (1894-99), edited by R. H. Inglis Palgrave. A complete list of headwords with one-line cross references appears at the beginning of each volume; cross references throughout the work direct the reader to entries where a particular topic is discussed under a different headword. Four appendices list: entries by author; biographies included in the original edition but not included in this edition; the contents of the original dictionary with the full name of each author; and subject entries in the new edition, by fifty-three fields, together with classification of biographies by country. Index.

GWARTNEY, JAMES D. AND STROUP, RICHARD L. *Economics: Private and public choices*. Fourth edition. With the assistance of A. H. STUDENMUND. San

Diego; London; Sydney and Toronto: Harcourt Brace Jovanovich, Academic Press, [1976 . . . 1982] 1987. Pp. xxx, 862. \$36.95. ISBN 0-15-518880-1. JEL 87-0974

Introductory textbook emphasizing the economic way of thinking. Focus of the macroeconomic section is changed from the Keynesian-cross model to a framework of a central multi-market model, including aggregate demand and supply analysis within the price-quantity framework. Integrates the basic aggregate markets—resources, loanable funds, goods, and services—from the beginning. Other features of the macroeconomic section include: the use of an open economy framework; emphasis on both changes in the price level and changes in output in achieving equilibrium in the aggregate goods and services market; integration of the natural unemployment rate and aggregate supply concepts; the presentation of schools of macroeconomics as debates over the structure of the central macroeconomic model; and a comprehensive discussion of the activism versus nonactivism stabilization policy debate. Microeconomic topics expanded or substantially revised include: the integration of the importance of property rights, transaction costs, and middlemen into the coverage of exchange theory and gains from trade; incorporation of recent developments on the significance of low barriers to entry and the theory of contestable markets into the theory of firm analysis; expanded coverage of deregulation; incorporation of recent empirical work on employment discrimination; a restructured focus of income distribution; expanded coverage of poverty and the analysis of income transfers; and the inclusion of a chapter on natural resources. Organizational features include: boxed articles reviewing myths of economics, applications of theory to real world situations, measures of economic activity, and outstanding economists; chapter focus questions and summaries; key terms; and discussion questions. A coursebook, test book for instructors, and instructor's manual are also available. Gwartney is Professor of Economics, Florida State University. Stroup is Professor of Economics, Montana State University. Glossary; index.

HAND, D. J. AND EVERITT, B. S., eds. *The statistical consultant in action*. Cambridge; New York and Melbourne: Cambridge University Press, 1987. Pp. xii, 189. \$34.50. ISBN 0-521-30717-1. JEL 87-0975

Twelve papers discuss experiences and issues in statistical consultancy. Topics include: consultants' careers; straight consulting; a two-period crossover trial; consultancy in a medical school; the analysis of response latencies; analysis of an

experiment on acid rain and tree roots; identifying yeasts and related problems; outlier allocation; collaboration between university and industry; inspection for faulty components in manufactured items; a project history of the statistical modeling of the EEC labor force survey. The contributors are statisticians. Hand and Everitt are at the Biometrics Unit, Institute of Psychiatry, London. Bibliography on statistical consulting; name and subject indexes.

HOGARTH, ROBIN M. AND REDER, MELVIN W., eds.  
*Rational choice: The contrast between economics and psychology*. Chicago and London: University of Chicago Press, 1987. Pp. ix, 332. \$30.00. ISBN 0-226-34857-1. JEL 87-0976

Fourteen papers, with comments, presented at a conference held at the University of Chicago in October 1985 and previously published as a supplement to the October 1986 issue of *The Journal of Business*. Part 1 examines rationality in psychology and economics; decision making under ambiguity; and rational choice and the framing of decisions. Part 2 focuses on fairness and the assumptions of economics, and rational choice in experimental markets. Part 3 covers rationality and utility in evolutionary biology; psychological and social structure in economic models; the restrictiveness of the rational expectations hypothesis; and the behavioral foundations of public policy. Part 4 examines rationality of self and others in an economic system, and adaptive behavior and economic theory. Part 5 reviews behavioral rationality in finance and anomalies in financial economics. Hogarth is Professor of Behavioral Science at the University of Chicago Graduate School of Business and Director of the Center for Decision Research. Reder is Isidor and Gladys J. Brown Professor Emeritus at the University of Chicago Graduate School of Business. Index.

LADD, GEORGE W. *Imagination in research: An economist's view*. Ames: Iowa State University Press, 1987. Pp. viii, 146. \$9.95, paper. ISBN 0-8138-0987-8. JEL 87-0977

Analysis of the role of the unconscious mind in scientific research. Argues that unconscious mental processes are essential research tools, discusses some of their characteristics, and asserts that the very nature of conscious mental processes limits their use in invention. Analyzes the conditions that stimulate unconscious mental processes including doubt, a venturesome attitude, tolerance for uncertainty, diversity, thorough preparation, and sensitivity to similarities. Examines the role of luck in scientific research and means of harnessing it. Also discusses university training for creative scientists.

Ladd is Professor of Economics, Iowa State University. Index.

OTT, ALFRED E. AND STRECKER, HEINRICH, eds.  
*Jahrbücher für nationalökonomie und Statistik*. Band 202: *Generalregister der Bände 131 (1929) bis 200 (1985)*. Stuttgart and New York: Fischer, 1986. Pp. viii, 498. DM 258.00, paper. ISBN 3-437-50307-3. JEL 87-0978

An index of articles and book reviews published in this journal from 1929 through 1985. Three introductory papers (in German) describe the history of the journal and its editors. Includes separate indexes to articles and book reviews, arranged alphabetically by the author of the article or the book. Also includes an alphabetical list of topics which refers to the article index and a review list which refers to the book review index.

RADNITZKY, GERARD AND BERNHÖLZ, PETER, eds.  
*Economic imperialism: The economic approach applied outside the field of economics*. Professors' World Peace Academy Book series. New York: Paragon House, 1987. Pp. ix, 421. \$21.95, cloth; \$12.95, paper. ISBN 0-943852-11-0. JEL 87-0979

Result of a workshop that led to a colloquium in Vienna in June 1984, sponsored by the Professors' World Peace Academy. Fourteen contributions explore the potential of the economic approach to human behavior in areas outside the traditional fields of economics. Part 1 introduces the reader to the economic approach and discusses: principles and prospects for general economy; the prospects and limitations of the economic approach to human behavior; and the nature and methodological foundations of recent extensions of economic theory. Part 2 applies the economic approach to the study of history, emphasizing economic considerations in history and the economic theory of democracy. Part 3 examines: norms as social capital; blackmail; intellectual styles and the evolution of American corporate law; and theory and application of the demand for life. Part 4 discusses the economics of scientific discovery and presents an application of the economic approach to the problems of the philosophy of science. Part 5 applies the economic approach to political science, focusing on conflict, autocracy, and the central problems of the constitution of a democracy. Contributors are mainly economists, sociologists, and lawyers. Radnitzky is Professor of the Philosophy of Science, University of Trier, West Germany. Bernholz is Professor of Economics at the Institute for Social Sciences, University of Basel, Switzerland. Name and subject indexes.

TAMARI, MEIR. *"With all your possessions: Jewish ethics and economic life."* New York: Macmillan, Free Press; London: Collier Macmillan, 1987. Pp. xii, 340. \$22.50. ISBN 0-02-932150-6.

JEL 87-0980

Evaluation of Judaism and its relationship to economics. Drawing on legal, historical, and religious sources, the author traces how economic activity was traditionally guided and determined by the teachings of Judaism and its religious law. Considers attitudes toward economic activity such as finance, poverty, money, trade, and welfare as being tempered by understandings of the demands of justice, mercy, and righteousness. Covers a wide range of economic aspects—profits, wages, labor, money, banking, taxation, and welfare—as they are dealt with in Jewish sources. Tamari is Chief Economist, Office of the Governor of the Bank of Israel, Jerusalem. Bibliography; index.

## 020 GENERAL ECONOMIC THEORY

BLACK, DUNCAN. *The theory of committees and elections.* Norwell, Mass.; Dordrecht and Lancaster: Kluwer Academic, 1987. Pp. xiii, 241. \$29.95. ISBN 0-89838-189-4.

JEL 87-0981

An exposition of the logic of committee decisions and elections. Part 1 deals with the theory of committees and elections, and covers: independent valuation; the representation of a motion; preference curves for a committee using a simple majority; cyclical majorities; members' scales of valuation; who ought to be elected; election in single member constituencies; proportional representation; committees using a special majority; the elasticity of committee decisions; groups of schedules corresponding to a given voting matrix; complementary motions in committees using a simple majority; and international agreements, sovereignty, and the cabinet. Part 2 presents the history of the mathematical theory of committees and elections. Black is Emeritus Professor of Economics at the University College of North Wales. Index.

CALVERT, RANDALL L. *Models of imperfect information in politics.* Fundamentals of Pure and Applied Economics series, Political Science and Economics section, vol. 6. Chur, Switzerland; London; Paris and New York: Harwood Academic, 1986. Pp. viii, 62. \$18.00, paper. ISBN 3-7186-0321-7.

JEL 87-0982

Surveys the theoretical literature on the effects of imperfect information in politics, concentrating exclusively on treatments using the rational actor methodology. Focuses on models of electoral politics, noting topics in the modern economics of uncertainty that are applicable to important political questions. Examines the effects of imperfect infor-

mation for candidates, including probabilistic voting models, and the problem of rational participation. Considers principal-agent models and models of reputation effects in oligopoly. Concludes that many areas of politics remain untouched by models of imperfect information. Calvert is Associate Professor of Political Science and Resident Fellow of the Center for Political Economy, Washington University, St. Louis. Index.

CAMPBELL, DONALD E. *Resource allocation mechanisms.* Cambridge; New York and Melbourne: Cambridge University Press, 1987. Pp. xiii, 183. \$34.50, cloth; \$12.95, paper. ISBN 0-521-26664-5.

JEL 87-0983

Analysis of the general welfare implications of individual decisions in systems in which coordination of individual activities is necessary to obtain a high level of overall welfare. Discusses alternative resource allocation mechanisms. Describes a set of performance criteria and examines their relevance to an Arrow-Debreu world. Analyzes the impact of uncertainty on welfare and investigates incentive compatibility. Examines the conditions under which competitive equilibrium exists and reviews the welfare properties of the Walrasian mechanism. Campbell is Professor of Economics at the University of Toronto. Author and subject indexes.

CYERT, RICHARD M. AND DEGROOT, MORRIS H. *Bayesian analysis and uncertainty in economic theory.* Rowman and Littlefield Probability and Statistics Series. Totowa, N.J.; Littlefield, Adams; Rowman and Littlefield, 1987. Pp. xiv, 206. \$34.95. ISBN 0-8476-7471-1.

JEL 87-0984

Presents an application of Bayesian analysis to decision making under uncertainty in microeconomic theory. Reviews the main concepts of Bayesian decision theory and presents a behavioral and control theory of the firm. Discusses the application of Bayesian analysis to different problems in duopoly theory: multiperiod models in which each firm makes decisions in alternate periods; models of cooperation between firms; the kinked demand curve model; and linear-quadratic stochastic control problems. Examines the Bayesian approach to adaptive utility, capital allocation within firms, and rational expectations. Cyert is President and DeGroot is University Professor of Statistics and Industrial Administration, Carnegie-Mellon University. Author and subject indexes.

DRAITZ, JACQUES H. *Essays on economic decisions under uncertainty.* Cambridge; New York and Melbourne: Cambridge University Press, 1987. Pp. xxvii, 424. \$39.50. ISBN 0-521-26484-7.

JEL 87-0985

Twenty papers by the author, all but one previously published, discuss topics in decision making under uncertainty. Examines: the general theory of decision making under uncertainty; markets and prices; consumer decisions; producer decisions; theory of the firm; human capital and labor contracts; and public decisions. Specific topics include: a review of the axiomatic theories of choice, cardinal utility, and subjective probability; market allocation under uncertainty; state-dependent utility, the demand for insurance, and the value of safety; a model of interdependent choice for earnings, assets, and savings; demand fluctuations, capacity utilization, and prices and costs; industry equilibrium under uncertainty; investment under private ownership; decision criteria for business firms; the firm in general equilibrium theory; human capital and risk-bearing; pricing, spending, and gambling rules for nonprofit organizations; and econometrics and decision theory. Drèze is at the Center for Operations Research and Econometrics in Louvain. Index.

ELIASSON, GUNNAR, ed. *The economics of institutions and markets: IUI Yearbook 1986-1987*. Stockholm: Industrial Institute for Economic and Social Research, Research Program, 1987. Pp. 260. Free, paper. ISBN 91-7204-275-3. JEL 87-0986

Thirteen papers discuss topics related to the economics of institutions and markets. One paper outlines the need for and the nature of institutional economics. Four papers analyze institutional change and macroeconomic performance in various sectors. Five papers examine institutions and market processes with examples from the Swedish economy. Three papers evaluate the theoretical support for policy. Also contains details on current and recently completed research projects as well as other activities at the Industrial Institute for Economic and Social Research. No index.

FEIWEL, GEORGE R., ed. *Arrow and the ascent of modern economic theory*. New York: New York University Press, 1987. Pp. liv, 696. \$75.00. ISBN 0-8147-2582-1. JEL 87-0987

Twenty-three essays and interviews examine the ascent of modern economics and the works of Kenneth Arrow, emphasizing his contributions to, and impact on, both the theoretical and applied economics, and moral and political philosophy of our age. An introduction by the editor examines the contributions of Arrow from the perspective of the potentials and limits of economic analysis. Part 1 presents interviews by the editor with leaders in the development of modern general equilibrium theory. Part 2 focuses on Arrow's impact on mathematical method in economics and on application

of general equilibrium theory, and contains an essay on Arrow's vision of the economic process followed by four interviews. Essays in part 3 emphasize the theory of resource allocation and topics include: the nonexistence of equilibrium; equilibria of bid-ask markets; general equilibrium analysis of imperfect competition; Arrow and the theory of discrimination; and information disclosure and the economics of science and technology. Part 4 discusses decision making under uncertainty, focusing on: von Neumann-Morgenstern utilities, risk taking, and welfare; Arrow-Bayes equilibria; rational learning and rational expectations; and oligopolistic uncertainty and optimal bidding in government procurement. Concludes with Arrow's own reflections on the essays. Feiwel is Alumni Distinguished Service Professor and Professor of Economics at the University of Tennessee. Index.

FEIWEL, GEORGE R., ed. *Arrow and the foundations of the theory of economic policy*. New York: New York University Press, 1987. Pp. lxiii, 758. \$75.00. ISBN 0-8147-2583-X. JEL 87-0988

Thirty-six essays and interviews examine the foundations of the theory of economic policy and the contributions of Kenneth Arrow. The introduction consists of an article by the editor on the many dimensions of Arrow and an essay on social choice theory. Essays in part 1 deal with social choice and utilitarianism, and discuss: ordinal utilitarianism; reconciling Arrow's theory of social choice with Harsanyi's fundamental utilitarianism; Arrow and the problem of social choice; and utilitarianism and modern economics. Part 2 focuses on welfare and distribution, and examines: the fair allocation of indivisible goods; income distribution and differences in needs; and the tension theory of welfare. Part 3 examines growth, choice, and the use of resources, and specific topics include: the life-cycle hypothesis as a tool of theory and policy, and the credit mechanism and its implications. Part 4 discusses the limits of organization and alternative approaches, focusing on: Arrow and the new institutional economics and economic aspects of trust. Part 5 contains essays and interviews on the images of Arrow, and part 6 presents Arrow's reflections on the essays. Feiwel is Alumni Distinguished Science Professor and Professor of Economics at the University of Tennessee. Index.

FLETCHER, GORDON A. *The Keynesian revolution and its critics: Issues of theory and policy for the monetary production economy*. New York: St. Martin's Press, 1987. Pp. xxiii, 348. \$35.00. ISBN 0-312-45960-8. JEL 87-0989

Focuses on criticisms of the Keynesian revolution, judging the case against Keynes by reference

to his principal critics—D. H. Robertson, Milton Friedman, F. A. Hayek and, "vicariously," Georg Simmel. Describes what the Revolution was, why it took place, and what it achieved. Assesses the extent to which Keynesian principles remain valid in, and relevant to, the current environment. Bases much of the description of Keynes's economics on the *General Theory* and the controversy that ensued. Examines the apparent failure and disenchantment with Keynesianism, and the upsurge of Austrian and monetarist philosophy in the 1970s, especially as the problem of inflation was being reduced at the expense of employment. Concludes that the problems of the postwar Keynesian political economy must be distinguished from the core of Keynes's theory and that Keynesian principles remain valid. Fletcher is Lecturer in Economics, University of Liverpool. Index.

FUJINO, SHOZABURO. *Money, employment, and interest: Towards a reconstruction of Keynesian economics*. Hitotsubashi University Institute of Economic Research Economic Research Series, no. 23. Tokyo: Kinokuniya; distributed in the United States by New York Kinokuniya Bookstores, 1987. Pp. xii, 220. ISBN 4-314-00464-9.

JEL 87-0990

Analysis of key issues in macroeconomics: demand restriction in the monetary economy and involuntary unemployment; demand uncertainty; aggregate demand and aggregate supply functions; and the theory of interest. Contends that the assumption of perfect competition must be abandoned in the analysis of output and prices because it contradicts the fundamental property of the monetary economy. Topics include: the logical structure of the monetary economy and the asymmetry of demand and supply; the postulates of classical economics, and the permanent supply of labor and the asymmetry of the firm and household; the principle of effective demand, and supply and involuntary unemployment; demand uncertainty and output-inventory decisions; demand uncertainty and output-backlog decisions; demand uncertainty and the theory of investment; aggregate demand and supply functions; and liquidity-preference versus loanable-funds theories of interest. Fujino is Professor of Economics at the Institute of Economic Research, Hitotsubashi University. Name and subject indexes.

HALL, PETER A. *Governing the economy: The politics of state intervention in Britain and France*. Europe and the International Order series. New York: Oxford University Press, 1986. Pp. 341. \$36.00, cloth; \$14.95, paper. ISBN 0-19-520523-5.

JEL 87-0991

Analysis of the political dimensions of economic policy making in Britain and France over the postwar period. Contends that economic policy making must be understood as an essentially political process, conditioned by struggles among competing parties, ideologies, and social classes. Develops an institutional approach to the explanation of policy outcomes, examining the role of markets and the state in British economic decline, patterns of British economic policy, Keynesianism, and the conservative Thatcher experience. Analyzes the political role of economic planning in France, the role of the state in planning, and the socialist experiment of Mitterand. Presents comparative perspectives, covering broad patterns of macroeconomic, industrial, and incomes policy in Britain, France, and Germany. Concludes with a discussion of the organization of state-society relations in Britain and France, focusing on the interaction of interests, institutions, and ideas in the policy process. Hall is Assistant Professor of Government at Harvard University. Bibliography; index.

HSIEH, CHING-YAO AND MANGUM, STEPHEN L. *A search for synthesis in economic theory*. Armonk, N.Y. and London: Sharpe, 1986. Pp. xii, 268. ISBN 0-87332-328-9.

JEL 87-0992

Published in an earlier version entitled *A Search for Synthesis*, this book is designed for graduate and advanced undergraduate students in economics as well as a wider audience. Analyzes the apparent crisis in economic theory and explores areas of common ground in economics. Part 1 provides a contemporary reinterpretation of classicism, reviewing the supply-side economics of Adam Smith and David Ricardo, the demand-side economics of Thomas Robert Malthus, and the nature of causality in classical economics. Part 2 presents contemporary reinterpretations of the neoclassical synthesis, and includes a review of the golden age of the neoclassical synthesis and a discussion of the revisionists of this synthesis. Part 3 focuses on contemporary reinterpretations of post-Keynesianism. Part 4 examines the widening common ground in economic theory, discussing the work of Jean-Pascal Benassy and Franklin M. Fisher as well as post-Keynesian microfoundations and other non-Walrasian approaches. Hsieh is Professor of Economics at George Washington University. Mangum is Assistant Professor of Management and Human Resources at Ohio State University. Bibliography; no index.

KEBARDJIAN, GÉRARD. *Les modèles théoriques de la macroéconomie (Theoretical models of macroeconomics)*. Collection: Economie "Module." Paris: Dunod; distributed in North America by Diffu-

livre, Montreal, 1987. Pp. xiv, 192. Fr 115.00, Can\$ 34.00, paper. ISBN 2-04-016930-X.

JEL 87-0993

Intermediate level textbook, providing a synthesis of major theoretical models presented in macroeconomics, using a unified system of accounts to allow for comparisons: classical, Keynesian, post-Keynesian, neoclassical, and Marxian. Includes a number of review problems. A technically simplified presentation allows the student to identify the basis of the controversies in current debates on the proper contribution of each model. Kebabdjian is Professor at the University of Reims, France, and President of the Centre de Recherches sur les Mutations des Sociétés Industrielles. Bibliography; name and subject index. [Jean Mirucki]

LAVOIE, MARC. *Macroéconomie: Théorie et controverses postkeynésiennes (Macroeconomics: Theory and post-Keynesian controversies)*. Collection: Sciences économiques. Paris: Dunod/Éditions Bo-Pré; distributed in North America by Diffulivre, Montreal, 1987. Pp. x, 220. Fr 149.00, Can\$ 44.00, paper. ISBN 2-04-016904-0. JEL 87-0994

Graduate textbook providing a critique of the foundations of traditional macroeconomics and proposing a possible alternative: a post-Keynesian approach applied to growth and distribution. Refutes the logic of the aggregate neoclassical theory in both the static and the dynamic models. Presents the "School of Cambridge" approach with special emphasis on the situational framework and its impact on growth: the role of the state and of the investors, the objectives of full employment and the behavior of the firm, the presence of financial markets, and the role of money. Lavoie is Professor at the University of Ottawa. Bibliography; subject index. [Jean Mirucki]

MARGLIN, STEPHEN A. *Growth, distribution, and prices*. Paperback reprint. Harvard Economic Studies series, vol. 155. Cambridge, Mass. and London: Harvard University Press, [1984] 1987. Pp. x, 573. \$11.95, paper. ISBN 0-674-36415-5.

JEL 87-0995

Paperback reprint. [See JEL no. 85-0356 for annotation of first edition and Volume 23, no. 4, the December 1985 issue, for review.]

MERKHOFFER, MILEY W. *Decision science and social risk management: A comparative evaluation of cost-benefit analysis, decision analysis, and other formal decision-aiding approaches*. Technology, Risk, and Society series. Norwell, Mass.; Dordrecht; Lancaster and Tokyo: Kluwer Academic, Reidel, 1987. Pp. xiv, 330. \$49.00. ISBN 90-277-2275-7. JEL 87-0996

Differentiates, compares, and assesses alternative approaches to aid decision making. Focuses on approaches that: are applicable to social decisions involving risks; provide quantitative decision criteria, theoretical rationale, and practical procedures for identifying a "best" alternative; and have practical applications experience. Discusses the social risk-management problem. Distinguishes and describes alternative decision aiding approaches and outlines their principle criticisms and limitations. Concludes with a comparative evaluation of decision aiding approaches. Appendices present: a cost-benefit analysis of mobile-source sulfur oxide emission control; a decision analysis of alternative government policies for commercial cryptography; and an application of applied social welfare theory to space-mission planning. Merkhoffer is with Applied Decision Analysis, Inc. Name and subject indexes.

MIROWSKI, PHILIP, ed. *The reconstruction of economic theory*. Recent Economic Thought Series. Norwell, Mass.; Dordrecht and Lancaster: Kluwer Academic, Kluwer-Nijhoff, 1986. Pp. 266. \$42.50. ISBN 0-89638-211-4. JEL 87-0997

Seven essays consider orthodoxy and divergence in economic theory. In the introductory essay, Mirowski identifies neoclassical economic theory and a European variant of Marxianism as "hard core" schools of economic thought and describes a "third stream" of economic theory. David P. Levine presents a reconceptualization of classical economic theory. David P. Ellerman discusses property appropriation and economic theory. Randall Bausor examines time and equilibrium. Donald W. Katzner analyzes the role of formalism in economic thought with illustrations drawn from an analysis of the social interaction of the firm. Mirowski, in two essays, discusses mathematical formalism and economic explanation, and institutions as solution concepts in a game theory context. Mirowski is a member of the Department of Economics at Tufts University. Index.

TOBIN, JAMES. *Essays in economics*. Volume 1. *Macroeconomics*. Reprint. Cambridge, Mass. and London: MIT Press, [1971] 1987. Pp. xvi, 526. \$60.00. ISBN 0-262-20082-7. JEL 87-0998

Reprint of the volume covering Tobin's work in macroeconomics from the early 1940s to 1970. Twenty-four essays are divided into three parts, focusing on macroeconomic theory, economic growth, and money and finance. Part 1 contains articles on the effects of a general change in money wage rates on employment, liquidity preference and monetary policy, short-run macro effects of income taxation, the role of the size and composi-

tions of wealth in the determination of economic activity, tax incentives to induce savings, and distribution theory. Part 2 has selections concerned with the interrelations between monetary phenomena and growth, economic growth as an objective of government policy, and neoclassical growth with fixed factor proportions. Part three examines the interest elasticity of transactions demand for cash, liquidity preference as behavior toward risk, commercial banks as creators of money, financial intermediaries and the effectiveness of monetary controls, a general equilibrium approach to monetary theory, deposit interest ceilings, debt management, pitfalls in financial model buildings, monetary policy and debt management, and monetary interpretation of history. Tobin is Sterling Professor of Economics at Yale and the 1981 Nobel Laureate in Economics. Index.

AN MEERHAEGHE, M. A. G. *Economic theory: A critic's companion*. Second revised edition. Hingham, Mass.; Dordrecht and Lancaster: Kluwer Academic, Martinus Nijhoff, [1960] 1986. Pp. x, 125. \$32.50. ISBN 90-247-3385-5. JEL 87-0999

Reorganized and updated second edition supplement to introductory courses in economics. [See JEL no. 80-0916 for annotation of first edition.] Offers critical comments on: the traditional economic theory of consumer and producer behavior; pricing theory; income distribution; the equilibrium level of national income and prices; economic growth; and international trade. Contains new chapters on the relationship between economic doctrines and economic policy, and economic theory and economic policy. Concludes with an assessment of the practicability and significance of economic theory. Meerhaeghe is at the University of Ghent. Author and subject indexes.

RIEZE, O. J. *Stochastic games with finite state and action spaces*. CWI Tract series, no. 33. Amsterdam: Centre for Mathematics and Computer Science, 1987. Pp. 221. Dfl 34.20, paper. ISBN 90-6196-313-3. JEL 87-1000

Analysis of two-person, zero-sum stochastic games with finite state space and finite action spaces for both players. Part 1 presents the model of the two-person, zero-sum stochastic game and discusses what happens when playing against a fixed strategy. Part 2 presents a review of discounted stochastic games, and discusses their structural properties and algorithms. Part 3 focuses on average reward stochastic games and discusses: their history; the limit discount equation; and the structural properties of, and algorithms for, undiscounted stochastic games. Author, subject, and symbol indexes.

ZARTMAN, I. WILLIAM, ed. *The 50% solution: How to bargain successfully with hijackers, strikers, bosses, oil magnates, Arabs, Russians, and other worthy opponents in this modern world*. Paperback reprint. New Haven and London: Yale University Press, [1976] 1987. Pp. viii, 552. \$40.00, cloth; \$14.95, paper. ISBN 0-300-03033-9, pbk.

JEL 87-1001

Reprint, with updated bibliography, of seventeen essays presenting an array of case histories of negotiations involving states, terrorists, multinationals, and labor unions, among others. An introductory essay by the editor discusses the analysis of negotiation. Essays examine: permanent negotiations; structural analysis and its alternatives; communications analysis and related approaches; sovereign and other parties as negotiators; and explanation and prediction. Zartman is Professor of International Politics at the School for Advanced International Studies at Johns Hopkins University. Bibliography; index.

### 030 HISTORY OF ECONOMIC THOUGHT; METHODOLOGY

BLACK, R. D. COLLISON, ed. *Ideas in economics*. Totowa, N.J.: Barnes and Noble Books, 1986. Pp. x, 246. \$27.50. ISBN 0-389-20644-X.

JEL 87-1002

Ten papers originally presented to Section F of the British association for the Advancement of Science at its 1985 meeting at the University of Strathclyde. Contributions are concerned with the ideas of the great economists of the past. Begins with an essay by the editor on the history of economic thought. Seven essays examine: Adam Smith's system of moral science and his treatment of public policy, James Stewart's corporate state, Jeremy Bentham's democratic despotism, David Ricardo's treatment of wages, John Stuart Mill and implications for modern economics, Karl Marx's *Capital* today, and the continuing relevance of Alfred Marshall. Two additional essays discuss the meaning of monetarism and the existence of monetarist ideas in the earlier writings of British economists, and John Maynard Keynes as a revolutionist. Black was Professor and Head of the Department of Economics at the Queen's University of Belfast from 1962 until his retirement in 1985. Index.

BRAYBROOKE, DAVID. *Philosophy of social science*. Foundations of Philosophy Series. Englewood

Cliffs, N.J.: Simon and Schuster, Prentice-Hall, 1987. Pp. viii, 136. Paper. ISBN 0-13-663394-3.

JEL 87-1003

Presents three views of social science: the interpretative, which tells us when actions are appropriate and what expectations they give rise to; the naturalistic, which looks for various conditions that make the occurrence of certain phenomena more probable; and the critical, which raises questions about meanings and rules. Examines the relationship between these three views and gives examples of each approach. Discusses four basic questions for the philosophy of science: cross-cultural, humanism-scientism, individualism-collectivism, and fact-value questions. Discusses intentionality and the distinction between reasons and causes. Examines causal regularities on the naturalistic side and settled social rules on the interpretative side. Argues that in some questions and methods critical social science may be reduced to the naturalistic and interpretative views, and examines mutual support between these two remaining sides. Concludes with a discussion of mutual presupposition between the naturalistic and interpretative sides of social science. Braybrooke is at Dalhousie University. Index.

BRIDEL, PASCAL. *Cambridge monetary thought: Development of saving-investment analysis from Marshall to Keynes*. New York: St. Martin's Press, 1987. Pp. x, 227. \$32.50. ISBN 0-312-11441-9.

JEL 87-1004

Revised version of the author's Ph.D. thesis written for the University of Cambridge over the period 1977-81. Critically evaluates the origin and development of the savings-investment technique of analysis undertaken by various members of the Cambridge School in the first part of this century. Examines Alfred Marshall's analytical framework, which underlies the interest-elastic investment-demand and saving-supply curves and the determination of the equilibrium rate of interest. Reviews Marshall's primitive version of the cumulative process resulting from his analysis of the relation between money, interest, and prices. Discusses the early contributions of R. G. Hawtrey, D. H. Robertson, J. M. Keynes, F. Lavington, and A. C. Pigou, and the systematic coordination and extension of these contributions by Robertson and Keynes. Provides further reflections on the rate of interest and examines the *General Theory* and the principle of effective demand. Bridel is Professor of Economics at the University of Lausanne, Switzerland. Bibliography; index.

GREEN, DAVID G. *The new conservatism: The counter-revolution in political, economic and social*

*thought*. New York: St. Martin's Press, 1987. Pp. xi, 238. \$32.50. ISBN 0-312-00477-X.

JEL 87-1005

Examines the impact of the "new liberalism" of the Thatcher and Reagan governments, and the gap between new liberal thought and practical politics. Part 1 explains the historical roots of the new philosophy and describes the central themes of the main schools representing this thinking. Reviews how Western liberalism developed from seventeenth-century roots, featuring economic and religious individualism. Considers three closely related traditions—anarcho-libertarianism, minimal statism, and objectivism. Describes, in detail, Milton Friedman and the Chicago School, the public choice school, and Friedrich von Hayek and the Austrian School. Part 2 describes the political agenda of the new liberalism and its impact on public policy, with particular reference to education, social security, health, housing, the environment, the economy, industry, and agriculture. Concludes that the common theme among "new right" philosophies is that individuals should be able to direct their own lives to a greater extent than is now possible, and that although the impact on practical politics has been "patchy," there is a changing agenda in academic and political arenas. Green is Research Fellow at the Institute of Economic Affairs. Index.

LANGER, GARY F. *The coming of age of political economy, 1815-1825*. Contributions in Economics and Economic History series, no. 72. New York and London: Greenwood Press, 1987. Pp. x, 224. \$35.95. ISBN 0-313-25645-4.

JEL 87-1006

Examination of how and why political economy came of age in Britain during the first third of the nineteenth century. Describes the origins and character of the scientific tradition in which the political economists of the period 1815-25 saw themselves participating. Reviews the careers of the celebrated masters of political economy—David Ricardo, Thomas Malthus, John McCulloch, and Robert Torrens. Examines the allies and opponents of political economy. Discusses the relationship of political economy to the reform of the monetary system and to the depression of 1819-21. Reviews the relationship of the science to the free trade movement and examines the relation of the activities of the political economist and their allies to the situation of the propertyless laborer. Langer is Assistant Professor of Economics at Roosevelt University. Bibliography; index.

MILL, JOHN STUART. *Principles of political economy, with some of their applications to social philosophy*. Reprint of 1909 London edition. Edited with

an introduction by SIR WILLIAM ASHLEY. Reprints of Economics Classics series. Fairfield, N.J.: Kelley, [1848 . . . 1909] 1987. Pp. liii, 1013. \$47.50, cloth; \$24.95, paper. ISBN 0-678-01453-1, pbk.

JEL 87-1007

Reprint of the 1909 "new" edition, incorporating the seventh edition (1871) text, the last edition revised by Mill. An introduction by Sir William Ashley discusses aspects of Mill's life that influenced his political and economic thinking. Notes that Mill regarded the distinction between the laws of production and those of the distribution of wealth as the most distinguishing characteristic of his work. Includes prefaces to all seven editions and indicates changes in editions in the notes. Discusses many of the topics still found in principle texts such as international demand, economies of scale, joint products, opportunity costs, interest, rent, increasing returns, competition, agents of production, wage differentials, utility and costs in relation to value, money, credit, foreign exchange, and the influence of government. Bibliographical notes; index.

#### 040 ECONOMIC HISTORY

COLTON, JOEL AND BRUCHEY, STUART, eds. *Technology, the economy, and society: The American experience*. New York: Columbia University Press, 1987. Pp. xiii, 287. \$35.00. ISBN 0-231-05964-7.

JEL 87-1008

Ten contributions, plus an introduction by the editors, explore the impact of technological change from colonial times to the present. Specific topics include: technological innovation and social change in the United States, 1870-1980; technology and the transformation of industrial organization; the impact of technology on American legal development, 1790-1985; technology and the transformation of the American party system; the impact of technological change on urban form; technological change and the American worker and farm movements; the impact of technological change on social structure in the United States Navy; the impact of technology on American education, 1880-1980; and the impact of technology on American religion. Contributors are mainly historians. Colton is Professor of History at Duke University. Bruchey is Allan Neving Professor of American Economic History at Columbia University. No index.

COOPER, FREDERICK. *On the African waterfront: Urban disorder and the transformation of work in*

*colonial Mombasa*. New Haven and London: Yale University Press, 1987. Pp. xvi, 290. \$27.50. ISBN 0-300-03618-3.

JEL 87-1009

Argues that the strike wave that passed through major cities and mining regions of Africa from the mid-1930s through the early 1950s created a crisis of ideas that undermined colonial conceptions of African labor and society and government's confidence that they could control the new social and economic forces. Uses the related history of strikes in Mombasa, Kenya, in the 1930s and 1940s to study how a government discovered the dangers and complexities of the existence of an African working population and how, in this instance, the British government attempted to transform a rapidly circulating labor force into a stable one rooted in urban residence and an urban way of life. Specific topics include: capitalist work discipline and the East African society; Mombasa society prior to the strikes; dockwork and disorder in Mombasa from 1934-47; the reorganization of dockwork; trade unionism up to 1963; and work, disorder, and the crisis of colonialism in Africa. Cooper is Professor of African History, University of Michigan. Index.

ELTIS, DAVID. *Economic growth and the ending of the transatlantic slave trade*. New York; Oxford; Toronto and Melbourne: Oxford University Press, 1987. Pp. xiii, 418. \$39.95. ISBN 0-19-504135-6.

JEL 87-1010

Examines the role of the slave trade in the nineteenth-century Atlantic economy. Part 1 discusses antislavery in the context of British expansion and industrialization, highlighting capitalism and abolition in Britain, and the origin and impact of antislavery and the labor problem. Part 2 examines the Atlantic slave system from 1760 to 1830, and focuses on: the market for slaves at the close of the legal slave trade; the restructuring of the slave trade, 1780s to the 1820s; and Africa and the initial impact of abolition. Part 3 reviews the abolitionist assault on slave traffic, 1820-50. Part 4 discusses the economic and political aspects of the illegal slave trade between 1820 and 1870, and part 5 examines the midcentury Atlantic economy and final suppression, 1830-70, focusing on the consequences of suppression in Africa and the Americas. Appendixes present statistical information on: the volume of the transatlantic slave trade, 1781-1867; age, sex, and price of slaves in trade after 1810; slave trade mortality; costs and profits in the illegal slave trade; plantation output and productivity estimates in the nineteenth-century Americas; and exchange rates and price level adjustments. Eltis is College Master at Algonquin College, Ontario. Index.

GOULD, MARK. *Revolution in the development of capitalism: The coming of the English Revolution*. Berkeley and London: University of California Press, 1987. Pp. xxvii, 508. \$48.00, cloth; \$14.95, paper. ISBN 0-520-06101-2, pbk.

JEL 87-1011

Examines the seventeenth century English social structure, focusing on the genesis of revolution within that structure and the consequences of revolution for the transformation of the structure. Outlines the theoretical assumptions and conceptual tools that serve as the foundation of the work. Analyzes the conditions determining the level of production within economic and political subsystems and the conditions of stability for these systems. Presents a theory of internal disorder, and formulates a model of prerevolutionary English social structure, specifying the patterned constraints within this social structure and analyzing the tendencies these constraints define. Presents a historical examination of the English revolutions of the seventeenth century and a stage sequence model of social development defined to be applicable to all social and action systems. Argues that the seventeenth-century English revolutions led to the creation of political conditions that, joined with the tendencies of a rationalized manufacturing system, allowed for the genesis of machine capitalism. Gould is Associate Professor of Sociology at Haverford College, Pennsylvania. Bibliography; index.

KNAPMAN, BRUCE. *Fiji's economic history, 1874-1939: Studies of capitalist colonial development*. Pacific Research Monograph series, no. 15. Canberra: National Centre for Development Studies, Research School of Pacific Studies, Australian National University, 1987. Pp. xi, 153. Paper. ISBN 0-86784-977-0.

JEL 87-1012

Assesses the impact of capitalism in Fiji during the first sixty-five years of British colonial rule. Examines capitalist export growth and the dominance of the colonial Sugar Refining Company; continuity and change in the noncapitalist economy; the demise of the white sugar planter; shipping dependency; the degree of market control and profitability of merchant capital; and monetary dependency and the political economy of exchange-rate policy. Concludes that Fiji's economic development under colonialism, although uneven and exploitative, did not impoverish the country or damage the prospects of long-term development and succeeded in raising the absolute level of income and establishing the foundation for postwar growth. Knapman is Lecturer in Economics at the School of Finance and Economics, New South Wales Institute of Technology. No index.

KOLCHIN, PETER. *Unfree labor: American slavery and Russian serfdom*. Cambridge, Mass. and London: Harvard University Press, Belknap Press, 1987. Pp. xiv, 517. \$25.00. ISBN 0-674-92097-X.

JEL 87-1013

Examines Russian serfdom and American slavery as the basis for a comparative study of unfree labor. Finds both similarities and differences between Russian and American bondage; they are similar in that they merged on the periphery of an expanding Europe in the sixteenth and seventeenth centuries under conditions of widespread labor scarcity and became entrenched as systems of agricultural production based on forced labor, and differ because of their respective historical environments. Describes events in both Russia and the American South, and interweaves them with comparative sections organized around themes relevant to both. Part 1 presents the world of the masters in both systems and details their management, treatment, and defense of unfree labor. Part 2 analyzes the community and culture in Russia and the American South, and examines the causes, consequences, and patterns of resistance by the bondsmen. The epilogue brings together the predominant themes of the book, and considers the crises that unfree labor faced in Russia and the American South by the middle of the nineteenth century. Kolchin is Professor of History, University of Delaware. Index.

LIMERICK, PATRICIA NELSON. *The legacy of conquest: The unbroken past of the American West*. New York and London: Norton; Markham, Ontario: Penguin Books Canada, 1987. Pp. 396. \$17.95. ISBN 0-393-02390-7.

JEL 87-1014

Examines the West as an important meeting ground where different racial groups intersected and were tied together by the workings of conquest. Argues that the intersection of ethnic diversity with property allocation unifies Western history. Part 1 examines: an empire of innocence, property values; denial and dependence; uncertain enterprises; and the meeting ground of past and present. Part 2 discusses: the persistence of natives; racialism on the run; America the borderland; mankind the manager; and the burdens of western American history. Limerick teaches history at the University of Colorado. Index.

PERRON, MICHELLE. *Workers on strike: France 1871-1890*. Translated from the French by CHRIS TURNER with the assistance of ENICA CARTER and CLAUDE LAUDET. New Haven and London: Yale University Press; Leamington Spa, England: Berg, [1984] 1987. Pp. 321. \$27.50. ISBN 0-300-63949-6.

JEL 87-1016

Analysis of strikes in France in the latter part of the nineteenth century. Originally published in French as *Jeunesse de la Grève: France 1871-1890* in 1964. Examines the origin of both sudden and announced strikes and the organizations and ring-leaders involved in the running of a strike. Discusses various strike methods as well as the nature of participation in strikes. Assesses the material circumstances of strikers and describes the form, sources, and extent of assistance available to them. Reviews the actions, meetings, and language employed in strikes to highlight the collective life of strikers. Analyzes the results of strikes and the role of employers, the state, and society. Concludes: that strikes were proletarian in character and derived their support from the middle layers of the working class; that the nature of the strike was influenced by type of occupation; and that the strike is a social process rather than an empty form. Perrot is Professor of History at the University of Paris. Select bibliography; no index.

POTTER, BEATRICE. *The co-operative movement in Great Britain*. Third edition. Aldershot, England and Brookfield, Vt.: Gower in association with the London School of Economics and Political Science, [1891, 1893] 1987. Pp. xxxvii, 260. \$53.95. ISBN 0-566-05143-5. JEL 87-1017

First published in 1891 with a second edition published in 1893 that included an index and minor corrections. Current edition includes a nineteen page preface by Dame Margaret Cole. Describes the origin and growth of the British Co-operative Movement as a form of democratic association representing one aspect of the larger movement toward industrial democracy, which characterized the history of the nineteenth century British working class. Begins with a discussion of the cooperative idea, stimulated by the conditions stemming from the early years of the Industrial Revolution. Presents a history of the British movement and describes the cooperative store and the principles behind its operation. Reviews the development of the idea of federation whereby the independent stores ceded some powers to a central body. Examines associations of producers as a brotherhood of workers controlling the organization and retaining profits and discusses the cooperative movement as a state within a state. Index.

RITTER, GERHARD A. *Social welfare in Germany and Britain: Origins and development*. Translated from the German by KIM TRAYNOR. New York and Leamington Spa, England: Berg; distributed in North America by St. Martin's Press, New York, [1963] 1986. Pp. xi, 211. \$25.50. ISBN 0-607582-40-4. JEL 87-1018

This account of the evolution of the social welfare system in Germany and Britain was originally published in German as *Sozialversicherung in Deutschland und England, Entstehung und Grundzüge im Vergleich*. Reviews the social concerns and social insurance in Europe in the late nineteenth century. Examines the state and social insurance in Germany before 1914, focusing on: the impact of the rise of the labor movement and the economic crisis upon social concerns; the motives for, and characteristics of, social insurance legislation in the 1890s; the attitude of political and social forces toward worker's insurance; and the effects of social insurance legislation. Discusses mass poverty and social reform in Britain at the turn of the century, examining: the delayed development of state social insurance; the causes of social and political reform efforts; liberal reform policy between 1906 and 1914; and the supporters of social legislation and the effect of reform. Compares the varying political motives, financing, and social forces and political institutions that shaped the structure of social insurance in these two countries before World War I. Ritter is Professor of Modern History at the University of Munich. Select bibliography; index.

SCHICK, IRVIN CEMIL AND TONAK, ERTUĞRUL AHMET, eds. *Turkey in transition: New perspectives*. With translations by REZAN BENATAR, IRVIN CEMIL SCHICK AND RONNIE MARGULIES. New York; Oxford; Toronto and Melbourne: Oxford University Press, 1987. Pp. xii, 405. \$39.95. ISBN 0-19-504085-3. JEL 87-1019

Thirteen papers, three previously published and revised, reflect upon economic and political trends in Turkey since World War I. Part 1 deals with its political development and covers the Ottoman heritage; the political economy of Turkish democracy; and the periods of monopoly and multiparty rule. Part 2 assesses the nature of political forces and examines the left, the ultranationalist right, the religious right, and the army. Part 3 focuses on Turkey's economic development and discusses: the process of agrarian change over 1923-70; economic development and crisis during 1950-80; changes in wage labor and unionization; and trade, aid, and debt. A final paper evaluates the changes in the decade before the military takeover of 1980 and examines prospects for the future. The contributors are mainly political scientists. Schick is a research scientist. Tonak teaches economics at Simon's Rock of Bard College, Great Barrington, Massachusetts. Index.

SOMMARIVA, ANDREA AND TULLIO, GIUSEPPE. *German macroeconomic history, 1880-1979: A study of the*

effects of economic policy on inflation, currency depreciation and growth. Foreword by CLIFFORD WYMER. New York: St. Martin's Press, 1987. Pp. xx, 264. \$35.00. ISBN 0-312-32588-6.

JEL 87-1030

Detailed analysis of the macroeconomic developments in Germany from 1880 to 1970. Examines the causes of economic growth and inflation, the effects of war destruction, and the consequences of the growth of the government sector. Analyzes the behavior of the Reichsbank and the international gold flows from 1876-1913. Surveys the empirical literature on the German hyperinflation of 1919-23 and develops a three-equation model of inflation and exchange-rate determination which allows for currency substitution and deviations of the exchange rate from purchasing power parity. Reviews the causes of the depression of 1929-33 in Germany, and presents a disequilibrium macroeconomic growth model of the German economy incorporating the quantity theory of money and the Fisher equation as long-run laws of economics. Sommariva is Economic Advisor at the Istituto Bancario San Paolo di Torino and lecturer at New York University. Tullio is Economic Advisor to the Commission of the European Communities in Brussels. Bibliography; index.

SPEIER, HANS. *German white-collar workers and the rise of Hitler*. Translation. New Haven and London: Yale University Press, [1977] 1986. Pp. xxv, 206. ISBN 0-300-03701-5.

JEL 87-1021

Originally published in German as *Die Angestellten vor dem Nationalsozialismus: Ein Beitrag zum Verständnis der deutschen Sozialstruktur 1918-1933* in 1977. Examines the status competition between German white collar workers and both the older bourgeoisie and the new industrial and blue collar working classes; shows how this struggle affected the structure of the state and the prospects for revolution. Covering the years from 1918 until 1933, the book discusses: the various strata among white collar workers; social origins of salaried employee's; promotion; social stratification; relations with blue collar workers and entrepreneurs; the foundations of social rank and respect; the nature of hierarchy within enterprises and notions of class membership; and the role of education. Evaluates white collar response to nationalism and the nature of white collar organizations. Speier is Robert M. M. MacIver Professor Emeritus in Sociology and Political Science at the University of Massachusetts, Amherst. Bibliography; index.

TEICHOVA, ALICE; LEVY-LEBOYER, MAURICE AND NUSBAUM, HELGA, eds. *Multinational enterprise in historical perspective*. Cambridge: New York

and Melbourne: Cambridge University Press, Paris: Editions de la Maison des Sciences de l'Homme, 1986. Pp. x, 396. \$49.50. ISBN 0-521-32040-2.

JEL 87-1022

Twenty-five papers published as part of the preparation for the Ninth International Economic History Congress that was held in Berne in August 1986 where one of the themes involved multinational enterprise (MNE). Introduction reviews criticisms of MNEs. Papers in the first part deal with the growth of MNEs, presenting a critique of the concept, a discussion of the technological and organizational underpinnings of MNEs, and a description of European MNEs in the United States from 1875 to 1914 as well as analyses of specific industrial MNEs, and banks and capital markets. Papers in part 2 are devoted to government and the MNEs, emphasizing the roles of home and host countries, including British manufacturing, oil and Mexico, international business and Poland, foreign enterprise in Finland, German MNEs and the Nazi state, agribusiness in Zimbabwe, MNEs and the sexual division of labor, MNEs and the New International Economic Order, and perspectives on MNEs. Teichova is Professor of Economic History at the University of East Anglia. Lévy-Leboyer is Professor of Economic History at the University of Paris, Nanterre. Nussbaum is Head of the Institut für Wirtschaftsgeschichte, Akademie der Wissenschaften der DDR. Name, firm, and subject indexes.

WORGER, WILLIAM H. *South Africa's city of diamonds: Mine workers and monopoly capitalism in Kimberley, 1867-1895*. Yale Historical Publications series, Miscellany no. 135. New Haven and London: Yale University Press, 1987. Pp. xvi, 330. ISBN 0-300-03716-3.

JEL 87-1023

Examines the history of Kimberley and the diamond mining industry from the discovery of diamonds in the late 1860s to the development of a monopoly enterprise by Cecil Rhodes and DeBeers Consolidated Mines in the 1890s and 1900s. Part one examines: the transition from individual to large scale mining; the subjugation of the rural black societies to the demands of the industry; the use of law to build a prison-like urban community for blacks; and white mine workers, economic struggle, and labor consciousness. Part 2 discusses the establishment of a monopoly enterprise and the development of a company town. Concludes with a discussion of the tumultuous years of 1905-1906. Worger is Andrew W. Mellon Fellow in History at Stanford University. Select bibliography; index.

## 100 Economic Growth; Development; Planning; Fluctuations

## 110 ECONOMIC GROWTH; DEVELOPMENT; AND PLANNING THEORY AND POLICY

GRELLET, GÉRARD. *Structures et stratégies du développement économique (Structures and strategies of economic development)*. Collection: Thémis—Sciences économiques. Paris: Presses Universitaires de France; distributed by Les Editions Françaises, Boucherville, Quebec, 1986. Pp. 651. Fr 165.00, Can\$ 48.00, paper. ISBN 2-13039-594-5.

JEL 87-1025

Analyzes the different forms of underdevelopment and evaluates the merits of possible strategies in the context of interdependent economies. In the first part, the author proposes a typology of the form of economic development, according to the level of export and the effort of investment, in order to compare the different structures of development: regressive economies, extraverted industrial economies, and inarticulated economies. Theories and strategies of development are then examined providing detailed analysis of agricultural, industrial, demographic and social problems. The last part refers to North-South relations, mainly the flow of goods and capital, and the role of international aid. Grellet used this material while teaching at the Universities of Bangui, Rabat, Casablanca, Nantes, and Paris I. Subject index. [Jean Mirucki]

LYNCH, JOHN E., ed. *Economic adjustment and conversion of defense industries*. Westview Special Studies in Public Policy and Public Systems Management series. Boulder and London: Westview Press, 1987. Pp. xiv, 312. \$33.50, paper. ISBN 0-8133-7398-4.

JEL 87-1026

Fourteen papers and an introduction by the editor focus on policies to facilitate economic adjust-

ment and conversion of defense industries. Papers examine: the significance of defense spending; the policy debate regarding the conversion approach; the importance of defense-related employment for selected weapons systems; a comparative study of adjustment to defense industrial cutbacks in four communities; the civilian reuse of defunct military bases; corporate diversification programs involving attempts to convert from military to civilian markets; the European conversion experience; the reuse and conversion of industrial plants; the normal process of industrial plant redevelopment; civilian market opportunities for defense industries; state and local economic development programs; worker assistance and placement experience; the success of conversion policies; and dealing with major plant closures. The contributors are mainly economists. Lynch is Associate Director of Economic Adjustment, Office of the Secretary of Defense. Annotated bibliography; no index.

RICHARDS, ALAN. *Development and modes of production in Marxian economics: A critical evaluation*. Fundamentals of Pure and Applied Economics series, Marxian Economics section, vol. 12. Chur, Switzerland; London; Paris and New York: Harwood Academic, 1986. Pp. viii, 151. \$36.00, paper. ISBN 3-7186-0332-2.

JEL 87-1027

Surveys the state of the art regarding development and modes of production in Marxian economics to evaluate the strengths and weaknesses of a Marxist approach to economic development. Delineates the essential features of a Marxist approach to development problems and analyzes debates among Marxists on the uses of the concept of mode of production. The discussion of Marxist work on development focuses on each of three levels—sectoral (especially rural and agricultural), national, and international. The concluding chapter provides a summary and suggests ways in which the neoclassical approaches to induced institutional innovation and collective choice differ from Marxist approaches. Richards is Associate Professor of Economics, University of California, Santa Cruz. Index.

THIRLWALL, A. P., ed. *Keynes and economic development: The seventh Keynes seminar held at the University of Kent at Canterbury, 1985*. New York: St. Martin's Press, 1987. Pp. x, 186. \$27.50. ISBN 0-312-45199-7.

JEL 87-1028

Five papers and discussions examine various aspects of Keynes's life and work. Papers by A. P. Thirlwall, W. B. Reddaway, and Hans Singer discuss the relevance of Keynes and Keynesian analysis to developing countries. John Williamson speculates about the impact on developing countries

if the Keynes Plan had been adopted at Bretton Woods, and Edward Heath examines the problem of the North-South divide and the role of international Keynesianism. The contributors are mainly economists. Thirlwall is Professor of Applied Economics at the University of Kent at Canterbury. Name, author, and subject indexes.

## 120 COUNTRY STUDIES

CHENERY, HOLLIS; ROBINSON, SHERMAN AND SYRQUIN, MOSHE. *Industrialization and growth: A comparative study*. With contributions by GERSHON FEDER ET AL. New York; Oxford; Toronto and Melbourne: Oxford University Press for the World Bank, 1986. Pp. x, 387. \$29.95. ISBN 0-19-520547-2. JEL 87-1029

A series of studies by the authors and others examine postwar experiences of semi-industrial countries by comparing the sources of industrialization in different countries and analyzing structural change using a general equilibrium framework. Clarifies the role of industrialization in development through comparative studies of the economies of Colombia, Israel, Japan, South Korea, Mexico, Norway, Taiwan, Turkey, and Yugoslavia. Addresses three main topics: industrialization as a stage in the overall transformation that constitutes economic growth; the similarities and differences of the nine industrializing economies; and the relation between rising productivity and structural change. Chenery is Professor of Economics at Harvard University. Robinson is Professor of Agricultural and Resource Economics at the University of California, Berkeley. Syrquin is Professor of Economics at Bar-Ilan University, Israel. Index.

DUIGNAN, PETER AND JACKSON, ROBERT H., eds. *Politics and government in African states, 1960-1985*. London and Sydney: Croom Helm; Stanford, Calif.: Stanford University, Hoover Institution Press, 1986. Pp. 442. \$36.95. ISBN 0-8179-8481-X. JEL 87-1030

Eleven papers trace the evolution of the formal structure of government and politics in Sub-Saharan African states since independence. An introductory paper reviews the economic and political structure of African states, focusing on its common features and the impact of colonial rule. Subsequent papers focus on groups of countries: Nigeria and Ghana; Cameroon, Togo, and the states of the former French West Africa; Zaire and Cameroon; Malawi, Zambia, and Zimbabwe; Tan-

zania, Uganda, and Kenya; the Horn of Africa; South Africa; Namibia, Botswana, Lesotho, and Swaziland; and Angola, Mozambique, and Guinea-Bissau. A final paper considers prospects and possibilities for economic and political development. The contributors are: A. H. M. Kirk-Greene, Victor T. LeVine, Crawford Young, L. H. Gann, Carl G. Rosberg, Christopher Clapham, Thomas H. Henriksen, and the editors. Dugnan is Senior Fellow at the Hoover Institution. Jackson is Professor of Political Science at the University of British Columbia. Select bibliography; index.

[LEVCIK, FRIEDRICH] *Socialist economy and economic policy: Essays in honour of Friedrich Levcik*. Edited by G. FINK. Studien über Wirtschafts- und Systemvergleiche, Band 13. Vienna and New York: Springer, 1985. Pp. 279. \$24.20, paper. ISBN 0-387-81903-7. JEL 87-1031

Twenty-three papers (six in German) written and collected to honor Friedrich Levcik and his work related to comparative economics. General subject areas are: theory in socialism and economic reform; structural policy; employment and working time; finance, prices, and foreign exchange; international economic relations; and international comparisons. Specific topics include: the origins and development of the model of socialist economy, role of the law of value in socialist economy, technocratic versus democratic elements in the Polish economic reform, the state of Hungarian reform, structural change and international economic comparisons, problems of export-oriented restructuring of Polish industry, money supply and inflation in the Soviet Union, decentralization and financial equilibrium in a centrally planned economy, East-West trade and joint ventures, energy trade within COMECON, inventories in East and West, and the success of capitalism and the spread of socialism. No index.

LIPPIT, VICTOR D. *The economic development of China*. East Gate Books series. Armonk, N.Y. and London: Sharpe, 1987. Pp. ix, 289. \$35.00, cloth; \$14.95, paper. ISBN 0-87332-403-X. JEL 87-1032

Considers the economic development of China from the perspective of class interest and class structure and as a case study in socialist development. Presents a theoretical framework based on an analysis of class structure and surplus use to assess changes that have taken and are taking place in China. Uses the framework to determine reasons for China's development failure prior to 1949 and subsequent economic development since the founding of the People's Republic. Argues that the critical change was the replacement of classes with

a hostile or ambiguous attitude toward development by classes with a clear interest in development. The concluding chapter discusses some of the contradictions that have arisen in the socialist transition. General conclusions are that the existence of an autonomous, self-perpetuating hierarchy within Chinese society is an obstacle equally to the emergence of either capitalism or socialism and that China's development path currently lies somewhere between the statist and socialist models. Lippit is Professor of Economics, University of California, Riverside. Index.

MURAKAMI, YASUSUKE AND KOSAI, YUTAKA, eds. *Japan in the global community: Its role and contribution on the eve of the 21st century*. Round Table Discussion on Japan in the Global Community series. Tokyo: University of Tokyo Press; distributed by Columbia University Press, New York, 1986. Pp. xvii, 129. \$17.50, paper. ISBN 4-13-057014-5.

JEL 87-1033

Report organized from the proceedings of eight monthly conferences held between September 1985 and April 1986. Part 1 deals with Japan's economic, political, and cultural roles within the global community. Part 2 focuses on the conceptual framework that highlights Japan's role in the twenty-first century and presents a seven part proposal outlining its responsibilities and strategies. Part 3 highlights the role of the Japanese people as participants in this future global community. Murakami is Professor of Economics at the University of Tokyo. Kosai is Professor of Economics at the Tokyo Institute of Technology. No index.

SKARSTEIN, RUNE AND WANGWE, SAMUEL M. *Industrial development in Tanzania: Some critical issues*. Uppsala, Sweden: Scandinavian Institute of African Studies in cooperation with Tanzania Publishing House, Dar es Salaam; distributed by Almqvist and Wiksell International, Stockholm, 1986. Pp. xi, 291. SKr 80.00, paper. ISBN 91-7106-254-8.

JEL 87-1034

Analysis of key issues relating to the industrial development of Tanzania in the past two decades. Part 1 presents a historical analysis of industrial development in Tanzania since its independence and discusses the basic industry strategy adopted. Part 2 focuses on the problems and limitations of this strategy. Problem areas include: choice of technology, transfer of technology, and technology policy; economies of scale in industrial development; and linkages and sequencing in basic industries. Part 3 considers the choice between development through aid and through internal mechanisms, and examines the role of aid in economic growth as well as the role of agriculture in industrial development. No index.

TSAO, JAMES T. H. *China's development strategies and foreign trade*. Foreword by LAWRENCE R. KLEIN. Lexington, Mass. and Toronto: Heath, Lexington Books, 1987. Pp. xii, 209. \$32.00. ISBN 0-669-13954-8.

JEL 87-1035

Analysis of the problems of, and strategies for, China's economic development and foreign trade. Part 1 deals with economic development and traces trends and patterns of development and economic strategies since 1950. Discusses recent problems constraining economic growth and economic planning, and recent improvements in China's economic development. Part 2 focuses on China's foreign trade and discusses trends in trade and commercial policy since 1950. Analyzes problems and recent improvements in trade between the United States and China. Speculates on the probability of attaining long-term development objectives and presents the results of short-term projections. Appendices present statistical tables, details of an econometric model of China, and a comparison of two Chinese romanization systems. Tsao is a professor at Georgetown University. Glossary; bibliography; index.

UNITED NATIONS. *Economic and Social Survey of Asia and the Pacific, 1986*. U.N. Publications Sales No. E.87.II.F.1. Bangkok: Author, 1987. Pp. xiv, 172. \$20.00, paper. ISBN 92-1-119440-7.

JEL 87-1036

Fortieth annual survey of economies in the ESCAP region. Part 1 focuses on recent economic developments and considers: developments in the world economy and their impact on the ESCAP region; economic developments in the ESCAP region; and selected issues related to prices and public finance, trade and exchange rate policies, and agricultural price policies. Part 2 deals with human resource development in Asia and the Pacific and covers problems, policies, and perspectives relating to population, nutrition and health, and education. No index.

See also: Book Numbers JEL 87-0986, 87-0991, 87-1019, 87-1087, 87-1103, 87-1131, 87-1205

### 130 ECONOMIC FLUCTUATIONS; FORECASTING; STABILIZATION; AND INFLATION

BEREND, IVAN T. BORCHARDT, KNUT, eds. *The impact of the depression of the 1930s and its relevance for the contemporary world: Comparative studies prepared for the A/5 session of the 9th International Economic History Congress, 24-29 August, 1986, Bern, Switzerland*. Budapest: Karl Marx University of Economics, Academy Research Center of East-Central Europe; distributed by Kultura,

Hungarian Foreign Trading Company, 1986. Pp. 562. \$25.00, paper. ISBN 963-7251-45-6.

JEL 87-1037

Twenty-two essays (one in French and one in German), plus an introductory report and a concluding study, discuss the impact of the depression of the 1930s and its relevance for the contemporary world. Part one presents a series of case studies covering the United States, Australia, Great Britain, France, Belgium, Germany, Austria, East European economies, Yugoslavia, India, and El Salvador. Part two is devoted to a series of general topics and examines: the origin and similarities between the two crises of the twentieth century; post-World War II growth as a Schumpeter boom; economic crises and the state of confidence in each period; international capital movements and foreign exchange markets in crisis; the Latin American debt crisis; private consumption and the development of industrial production; and agriculture in the Great Depression and in the 1970s. Berend is President of the Hungarian Academy of Sciences. Borchardt is at the Volkswirtschaftliches Institut, University of Munich. No index.

CAGAN, PHILLIP, ed. *Deficits, taxes, and economic adjustments*. EDUARDO SOMENSATTO, associate editor. AEI Contemporary Economic Problems series, no. 455. Washington, D.C.: American Enterprise Institute for Public Policy Research, 1987. Pp. 332. \$27.50, cloth; \$14.75, paper. ISBN 0-8447-3620-1, pbk.

JEL 87-1038

Ten papers, preceded by summaries, examine major macroeconomic policy issues facing the U.S. economy. Topics include: causes and consequences of the behavior of the dollar; the international monetary system and proposals for international policy coordination; policy arguments arising from and related to changes in industrial structure and foreign competition; disinflation, the dollar, and velocity; the ups and downs of oil; financial strains and public policy to maintain financial stability; the influence of employment shifts and new job opportunities on the growth and distribution of real wages; the domestic budget after Gramm-Rudman and after Reagan; the new tax law; and lessons for the United States in the Japanese tax system. Cagan is Professor of Economics, Columbia University. Somensatto is a consultant for the World Bank. No index.

CUTLER, TONY; WILLIAMS, KAREL AND WILLIAMS, JOHN. *Keynes, Beveridge and beyond*. London and New York: Routledge and Kegan Paul, 1986. Pp. xi, 162. \$47.50. ISBN 0-7102-0483-3.

JEL 87-1040

Analysis of British economic and social policy since World War II. Argues that policy was guided

by a commitment to liberal collectivism whose main architects were Keynes and Beveridge. Discusses the inherent shortcomings of such a philosophy and argues that liberal collectivism became increasingly undermined during the economic expansion of the 1950s and 1960s and the succeeding recession of the 1970s and 1980s. Considers post-war development of company pensions as a form of occupational welfare, arguing that private pension schemes promote inequality. Analyzes the pattern of employment by gender, skill, and pay level, showing how the original assumptions about the social character of the workforce and the wage levels at which work would be available have been invalidated during the last thirty years. Concludes that the current crisis of the British economy cannot be resolved by use of the liberal collectivist philosophy and explores some new terrains of policy. Cutler teaches sociology at Middlesex Polytechnic. John Williams and Karel Williams teach economic and social history at the University College of Wales, Aberystwyth. Bibliography; index.

HOLDEN, K.; PEEL, D. A. AND THOMPSON, J. L. *The economics of wage control*. New York: St. Martin's Press, 1987. Pp. ix, 144. \$32.50. ISBN 0-312-23654-9.

JEL 87-1041

Introductory textbook on the economics of incomes policy. Reviews the historical experience of controls in a number of countries. Discusses ways of assessing the impact of conventional incomes policies and their effect on nominal wage change and on prices. Discusses the tax-based incomes policies and final offer arbitration. Presents the economics of indexation and discusses the future of wage and price controls. In spite of negative conclusions regarding the efficacy of incomes policies, suggests that wage and price controls may provide some influences that moderate the growth of unemployment while anti-inflationary policies are being pursued. Holden is Senior Lecturer in Economics at the University of Liverpool. Peel is Professor of Economics at University College, Aberystwyth. Thompson is Senior Lecturer in Economics at Liverpool Polytechnic. Author and subject indexes.

MARSHALL, MICHAEL. *Long waves of regional development*. New York: St. Martin's Press, 1987. Pp. xv, 280. \$32.50. ISBN 0-312-49674-5.

JEL 87-1042

Investigates long waves in regional development through a synthesis of regional analysis and long wave theory. Part 1 deals with long waves in capitalist development and reviews: theories of long waves; the relationship between long waves, technological change, and the capitalist labor process; and long waves, capitalist crisis, and the business

cycle. Part 2 describes the long waves of regional development in Britain between 1941 and 1971. Part 3 covers nineteenth-century long waves and includes a discussion of contrasting regional experiences as well as the uniqueness of the British experience. Part 4 focuses on twentieth-century long waves and covers economic fluctuations and uneven regional development, and industrial restructuring and the new spatial division of labor. Marshall is Senior Economist at the West Midlands Enterprise Board. Bibliography; author and subject indexes.

MASON, SIR JOHN; MATHIAS, P. AND WESTCOTT, J. H., eds. *Predictability in science and society: A joint symposium of the Royal Society and the British Academy held on 20 and 21 March 1986*. London: The Royal Society and the British Academy, 1986. Pp. viii, 145. £15.50, paper. ISBN 0-85403-284-3. JEL 87-1043

Eight papers and discussions, previously published in the *Proceedings of the Royal Society of London*, series A, volume 407, focus on predictability in physical and economic systems. A. K. Sen discusses methodological issues associated with prediction in economic theory. D. F. Hendry examines the role of prediction in evaluating econometric models. Sir James Lighthill covers the failure of predictability in Newtonian dynamics, and Sir John Mason assesses numerical weather predictions. G. A. Cohen examines historical inevitability and human agency in Marxism. J. H. Westcott reviews the application of control theory to macroeconomic models. Sir Terence Burns evaluates the interpretation and use of economic predictions, and J. A. Gulland discusses the predictability of living marine organisms. No index.

PARIKH, ASHOK. *Estimation and forecasting of trade shares*. Development Papers series, no. 5. U.N. Sales No. E.86.II.F.17. Bangkok, Thailand: United Nations Economic and Social Commission for Asia and the Pacific, 1986. Pp. ix, 344. \$33.00, paper. ISBN 92-1-119410-5. JEL 87-1044

Considers trade between the ESCAP countries and the rest of the world. Estimates and forecasts the trade of Asian developing countries to obtain information not available through the World Link study. Critically evaluates various methodologies for the estimation of bilateral trade shares and flows in terms of their assumptions, results, and predictive ability, and develops a method of estimating the elements of the trade share matrix that assumes that export prices and imports are exogenously given. Analyzes patterns of trade from 1965-80 and considers the assumptions needed by various approaches to the estimation of export equations and

import shares. Presents the author's Almost Ideal Demand System (AIDS) and estimates quantity share equations. Examines the uses of the CES utility function to derive a Hickman-Law linearized version to estimate the elasticity of substitution and estimates export equations by countries. Analyzes trade in manufactures using the AIDS and CES approaches and evaluates the predictive performance of various bilateral trade models. Concludes with a summary of the attempts to estimate trade shares in the context of link methodology. Parikh is Professor of Economics, School of Economic and Social Studies, University of East Anglia, Norwich, United Kingdom. No index.

RUDEBUSCH, GLENN D. *The estimation of macroeconomic disequilibrium models with regime classification information*. Lecture Notes in Economics and Mathematical Systems series, no. 288. New York; Berlin; London and Tokyo: Springer, 1987. Pp. 128. \$17.80, paper. ISBN 0-387-17757-4. JEL 87-1045

Discusses the econometric specification of a macroeconomic disequilibrium model incorporating nonstochastic information regarding market excess demand and the prevailing market regime. Part 1 discusses issues in the specification of disequilibrium models. Part 2 critically assesses three prior attempts at econometric specification, discusses the exact excess demand specification, and outlines practical criteria for evaluation of econometric disequilibrium specifications. Part 3 presents the details of the estimation of a disequilibrium model of the U.S. labor market specified with exact excess demand. Part 4 discusses the specification and estimation of a disequilibrium model with markets for labor, investment, and consumption. Part 5 presents conclusions and considers the prospects for disequilibrium modeling. Rudebusch is associated with the Division of Research and Statistics, Board of Governors of the Federal Reserve System. No index.

## 200 Quantitative Economic Methods and Data

### 210 ECONOMETRIC, STATISTICAL, AND MATHEMATICAL METHODS AND MODELS

BRATLEY, PAUL; FOX, BENNETT L. AND SCHRAGE, LINUS E. *A guide to simulation*. Second edition. New York; Berlin; London and Tokyo: Springer, [1983]

1987. Pp. xx, 397. \$45.00. ISBN 3-387-96467-3.

JEL 87-1046

Graduate level textbook in simulation has been revised and updated. Topics include: variance reduction; output analysis; rational choice of input distributions; nonuniform and uniform random numbers; simulation programming; and programming to reduce the variance. New features include Mardov chain simulation and gradient estimation. The treatment of asynchronous observations, indirect estimation, standardized time series, and the generation of random integers has been updated. Bratley and Fox are at the Département d'informatique et de recherche opérationnelle, University of Montreal. Schrage is at the Graduate School of Business, University of Chicago. Author and subject indexes.

BROEMELING, LYLE D. AND TSURUMI, HIROKI. *Econometrics and structural change*. Statistics: Textbooks and monographs series, vol. 74. New York and Basel: Dekker, 1987. Pp. vii, 266. ISBN 0-8247-7500-7.

JEL 87-1047

An introduction to statistical inference regarding structural change primarily from the standpoint of Bayesian inference and within the framework of linear analysis. Presents examples of the treatment of structural change in econometrics and statistics, and discusses Bayesian statistical inference. Analyzes the univariate and multivariate case of changing parameter models, the treatment of structural change in time series, and alternative models for dealing with structural change in econometric research. Each chapter contains several exercises. Broemeling is Scientific Officer for Probability and Statistics, Office of Naval Research, Department of the Navy. Tsurumi is Professor of Economics, Rutgers University. Index.

[COCHRANE, DONALD] *Specification analysis in the linear model (In honour of Donald Cochrane)*. Edited by MAXWELL L. KING AND DAVID E. A. GILES. International Library of Economics series. London and New York: Routledge and Kegan Paul, 1987. Pp. ix, 358. ISBN 0-7102-0614-3.

JEL 87-1048

Fourteen articles plus an introduction by the editors, honoring the early econometric work of Donald Cochrane, the late Dean of Economics and Politics at Monash University in Australia. Papers develop the general specification analysis theme in various ways, with specific emphasis on specification issues arising in the context of autocorrelated errors with regression model. The first part (6 papers) deals with linear regression and autocorrelated errors and includes contributions. Part 2 (3 papers) deals with general model specifications.

The third part contains two chapters dealing with statistical issues of direct concern to econometricians. The last part comprises three essays dealing with data issues and applied econometrics. Three appendices reproduce two original articles written by Cochrane and Guy H. Orcutt and another by J. D. Sargan. King is Professor of Econometrics at Monash University, and Giles is Professor of Economics at the University of Canterbury, New Zealand. Index.

HARRIS, MILTON. *Dynamic economic analysis*. New York and Oxford: Oxford University Press, 1987. Pp. x, 137. \$19.95. ISBN 0-19-504406-1.

JEL 87-1049

A graduate level textbook that presents an exposition of the most common techniques of dynamic economic analysis. Reviews the necessary mathematical background and discusses stationary discounted dynamic programming. Examines valuation equilibrium and Pareto optimality, and recursive competitive equilibrium. Concludes with a discussion of sequential game equilibria. Contains end-of-chapter exercises, with a solution manual available for instructors. Index.

JAFFE, A. J. AND SPIRER, HERBERT F. *Misused statistics: Straight talk for twisted numbers*. Popular Statistics series, no. 5. New York and Basel: Dekker, 1987. Pp. xi, 237. ISBN 0-8247-7631-3.

JEL 87-1050

Outgrowth of a series of articles on the misuse of statistics that appeared in the *New York Statistician*. Helps the reader to become a critical observer of the statistical scene and to ask the proper questions. Misuses are classified into five categories: lack of knowledge of subject matter; quality of the basic data; preparation of the study and the report; statistical methodology; and deliberate suppression of data. Analyzes the misuses in detail and presents actual and theoretical examples. Discusses: survey and poll statistics, Ockham's Razor, affirmative action and discrimination statistics, ecotoplastics, and governmental statistics. Jaffe is Senior Research Scholar Emeritus at Columbia University. Spierer is Professor of Information Management at the University of Connecticut, Stamford. Index.

KLEIJNEN, JACK P. C. *Statistical tools for simulation practitioners*. Statistics: Textbooks and monographs series, vol. 76. New York and Basel: Dekker, 1987. Pp. xii, 439. ISBN 0-8247-7333-0.

JEL 87-1051

A guide for practitioners wishing to employ statistical techniques for the solution of simulation

problems. Part 1 is devoted to runlength and confidence intervals and covers: terminating simulations and elementary statistics; assumptions of the  $t$  statistic; responses other than the mean; sample size or runlength; elementary steady-state concepts; analyzing nonterminating simulations; and applications. Part 2 examines strategic issues related to regression analysis and experimental design and includes: types of variables; metamodeling; basic regression analysis; optimization of simulated systems; interactions; response surface designs; screening; and stagewise experimentation. Contains numerous exercises. Kleijnen is Professor of Simulation and Information Systems, Catholic University, Brabant, the Netherlands. Author and subject indexes.

- KURZHANSKI, A. B. AND SIGMUND, K., eds. *Dynamical systems: Proceedings of an IIASA (International Institute for Applied Systems Analysis) workshop on mathematics of dynamic processes, held at Sopron, Hungary, September 9-13, 1985*. Lecture Notes in Economics and Mathematical Systems series, no. 287. New York; Berlin; London and Tokyo: Springer, 1987. Pp. vi, 214. \$24.40, paper. ISBN 0-387-17698-5. JEL 87-1052

Sixteen papers investigate special topics in systems dynamics. Part 1 discusses topics related to discrete dynamical systems. Part 2 examines viability theory and multivalued dynamics. Part 3 covers stability analysis, and part 4 focuses on controlled dynamical systems. Part 5 deals with biological and social applications of dynamic systems analysis. The contributors are mainly mathematicians and systems analysts. Kurzhanski and Sigmund are associated with the International Institute of Applied Systems Analysis, Austria. No index.

- PAPANICOLAOU, GEORGE, ed. *Random media*. IMA Volumes in Mathematics and Its Applications series, vol. 7. New York and Berlin: Springer, 1987. Pp. 321. \$34.00. ISBN 0-387-96524-6.

JEL 87-1053

Twenty-one papers discuss current problems and methods in random media. Topics include: stable convergence and asymptotic capacity measures; effective equation and renormalization for a nonlinear wave problem with a random source; exercises for a book on random potentials; travel-time problems for waves in random media; amorphous semiconductors; localization for a random discrete wave equation; simulations and global optimization; low temperature behavior in random Ising models; wave equations, path integrals, and semiclassical approximations; effective conductivities of reciprocal media; one-dimensional random Schrödinger operators; numerical simulation of Ito stochastic differential equations; regularity of the density of

states for stochastic Jacobi matrices; dispersive bulk parameters for coherent propagation in correlated random distributions; and random rays and stochastic caustics. The contributors are mainly mathematicians. Papanicolaou is at the Institute for Mathematics and Its Applications, University of Minnesota. No index.

- WRIGHT, GEORGE AND AYTON, PETER, eds. *Judgmental forecasting*. Chichester; New York; Brisbane and Toronto: Wiley, 1987. Pp. ix, 293. \$59.95. ISBN 0-471-91327-8. JEL 87-1054

Fourteen papers present an overview of judgmental forecasting. Part 1 deals with the psychology of individual judgments and examines: the adequacy of judgmental forecasts; beliefs and expectations as causes of judgmental bias; the assessment of human judgment; subjective estimation of precise and vague uncertainties; and the psychology of forecasting. Part 2 focuses on judgment from groups of individuals and reviews: integrating group judgments in subjective forecasts; Delphi inquiry systems; forecasting methods for conflict situations; and bridging the gap between forecasting and action. Part 3 is concerned with the use of multiple regression analysis and discusses: social judgment theory and forecasting; linear models as decision aids in insurance decision making; and bootstrapping and linear models. Part 4 examines the use of mental models for generating scenarios and judgmental handling of energy scenarios. The contributors are associated with psychology departments and business schools. Ayton is with the Decision Analysis Group of the City of London Polytechnic. Wright is at the Bristol Business School. Index.

## 220 ECONOMIC AND SOCIAL STATISTICAL DATA AND ANALYSIS

- ARROUS, JEAN. *Analyse multisectorielle et croissance (Multisectoral analysis and growth)*. Paris: Economica; distributed in North America by Diffuseur G. Vermette, Boucherville, Quebec, 1987. Pp. vi, 345. Fr 145.00, Can\$ \$37.95, paper. ISBN 2-7178-1262-8. JEL 87-1055

Textbook dealing with the analysis of input-output tables in a dynamic context. Made up of twenty-two solved problems, it starts each one of them with a presentation of a given concept and some relevant bibliographical notes, followed by the statement of the problem. The detailed solution is illustrated with appropriate tables and graphs, occasionally including the instructions of the BASIC computer program, and presented with

an economic interpretation of the results. The first part, an introduction to multisectoral analysis using a two-sector model, is based on the contributions of Leontief and is followed by an analysis of the interdependency among physical goods and its impact on monetary and factor-sharing variables, and finally its relevance to selected aspects of economic thought. In the second part, several growth models are examined and treated with numerical examples: Leontief, Ricardo, Solow, Uzawa-Inada, and von Neumann. Arrous is Professor at the University of Strasbourg. Annotated bibliography; no index. [Jean Mirucki]

AXILROD, STEPHEN H., ET AL. *Debt, financial stability, and public policy: A symposium sponsored by the Federal Reserve Bank of Kansas City, Jackson Hole, Wyoming, August 27-29, 1986*. Kansas City: Federal Reserve Bank of Kansas City, 1986. Pp. xii, 235. Paper. JEL 87-1056

Six papers, and critical commentary, presented at a symposium attended by economists, Federal Reserve officials, and executives from government, financial institutions, and business. Examines the implications of rapid debt growth on the nation's financial stability and appropriate public policy responses. Bryon Higgins presents an overview of the symposium. Both Henry Kaufman and Benjamin Friedman discuss the impact of the growth of domestic debt on financial stability. Rudiger Dornbusch examines international debt and economic instability, and A. W. Clausen discusses international debt and public policy. Robert Eisenbois examines regulatory policies and financial stability, and Lawrence Summers discusses debt problems and macroeconomic policies. No index.

INTERNATIONAL MONETARY FUND. *World economic outlook, April 1987: A survey by the staff of the International Monetary Fund*. IMF Occasional Paper. World Economic and Financial Surveys series. Washington, D.C.: Author, 1987. Pp. vii, 194. \$15.00, paper. ISBN 0-939834-85-X.

JEL 87-1057

Semiannual review of world economic developments. Draws on the information the Fund staff gathers through regular and special consultations with member countries as well as through its econometric modeling techniques. Covers developments and performance of Fund countries in 1986 and prospects and issues concerning the world economic outlook to 1991 as well as in the short term (1987-88). Focuses on economic prospects and uncertainties in industrial countries and growth and adjustment in the developing world. Supplementary notes consider the prices of oil and non-oil primary commodities and the discrepancy in world current account balances. About half of

the book consists of a detailed statistical appendix. No index.

OWEN, DORAIN. *Money, wealth and expenditure: Integrated modelling of consumption and portfolio behaviour*. Cambridge; New York and Melbourne: Cambridge University Press, 1986. Pp. xi, 210. \$34.50. ISBN 0-521-26761-7. JEL 87-1058

Discusses key theoretical and empirical aspects of modeling real-financial linkages and presents the "Yale" or general equilibrium approach to modeling sectoral financial behavior, focusing on the Brainard-Tobin "Pitfalls" model. Considers possible extensions of this model for modeling expenditure and portfolio behavior jointly. Reviews methods of econometric estimation of systems of equations in portfolio models and surveys empirical applications of the general equilibrium model. Describes the sources of quarterly stock and flow data for the United Kingdom personal sector's portfolio and presents the results of estimation and testing of integrated models of expenditure and portfolio behavior. Owen is associated with the University of Reading. Author and subject indexes.

SMITH, STEPHEN. *Britain's shadow economy*. Oxford; New York; Toronto and Melbourne: Oxford University Press, Clarendon Press, 1986. Pp. xii, 203. \$34.50. ISBN 0-19-828569-8. JEL 87-1059

Analysis of the nature and relative size of Britain's shadow economy—that portion of economic activity not covered by the economic accounts. Part 1 defines the shadow economy and considers it in relation to the national accounts. Part 2 discusses the incentives and opportunities for tax and benefit fraud as well as issues of detection, prosecution, and penalties. Part 3 focuses on measurement of the black economy and highlights the use of evidence from the demand for cash, national accounts discrepancies, and survey discrepancies. Part 4 covers the wider shadow economy, assesses the extent of the household economy, and examines the nature of substitution between the formal, household, and communal economies. Smith is Senior Research Officer at the Institute for Fiscal Studies. Bibliography; no index.

### 300 Domestic Monetary and Fiscal Theory and Institutions

#### 310 DOMESTIC MONETARY AND FINANCIAL THEORY AND INSTITUTIONS

BAMBERG, GÜNTER AND SPREHMANN, KLAUS, eds. *Capital market equilibria*. With contributions by G.

BAMBERG ET AL. New York; Berlin and Tokyo: Springer, 1986. Pp. x, 228. \$35.00. ISBN 0-387-16248-8. JEL 87-1060

Six papers that are both introductory surveys and results of individual research on current issues of finance and related concepts of capital market equilibria. Intended to be an up-to-date backup for standard textbooks that treat finance from the equilibrium point of view. Topics are: the hybrid model and related approaches to capital market equilibria (Günter Bamberg); problems of portfolio decisions and capital market equilibria under incomplete information (Volker Firschau); the theory and empirical evidence related to option valuation (Robert Geske and Siegfried Trautmann); establishing the value of security agreements (Bernd Rudolph); testing the asset pricing model in a small economy where the issue of integration or segmentation of different national markets cannot be decided beforehand (Eduardo S. Schwarte and Michael J. Brennan); and the simple analytics of arbitrage (Klaus Spremann). Bamberg is Professor of Statistics, University of Augsburg. Spremann is Professor at the University of Ulm. Author and subject indexes.

BARINA, MARCO AND CARLETTI, SILVANO. *Changes in the degree of concentration of the Italian banking system: An international comparison*. Research Papers series, no. 5. Rome: Banca Nazionale Del Lavoro, Economic Research Department, 1986. Pp. 90. Paper. JEL 87-1061

Analysis of the degree of concentration of the Italian banking system. Discusses problems of methods and estimation, and the interpretation of concentration indices. Presents data on the degree of concentration in the Italian banking system at the end of World War II and changes in its structure from 1976 to 1984. Compares banking concentration between Italy and France, Germany, Great Britain, Japan, and the United States. Bibliography; no index.

CIOCCA, PIERLUIGI, ed. *Money and the economy: Central bankers' views*. Translation. New York: St. Martin's Press, [1983] 1987. Pp. x, 331. \$29.95. ISBN 0-312-54429-4. JEL 87-1062

Sixteen previously published papers and an introduction by the editor present the reflections of central bankers from various countries. Part 1 covers the nature and functions of the central bank. Part 2 presents various experiences with monetary management. Part 3 deals with the relationship between the central bank and commercial banks. Part 4 focuses on the international dimensions of central banking. The contributors are, or have been, governors of central banks. CioCCA is Central

Manager for Central Bank Operations at the Ban d'Italia in Rome. Index.

DORN, JAMES A. AND SCHWARTZ, ANNA J., eds. *The search for stable money: Essays on monetary reform*. Chicago and London: University of Chicago Press and the Cato Institute, 1987. Pp. xvii, 40. \$30.00, cloth; \$13.95, paper. ISBN 0-226-15836-6, pbk. JEL 87-10

Nineteen papers and comments, most previous published in the *Cato Journal*, discuss issues related to the stability of money. One paper presents a historical perspective on the search for stable money. Three papers discuss the erratic nature of Federal Reserve policy. Three papers discuss the possibility of constitutional monetary reform. Three papers focus on the role of monetarism in the search for stable money. Two papers examine the central issues relating to monetary policy at the gold standard. Four papers assess the prospects for the denationalization of money, and three papers discuss the future of monetary policy. The contributors are economists. Dorn is Editor of the *Cato Journal* and Associate Professor of Economics at Towson State University. Schwartz is Research Associate, National Bureau of Economic Research. Index.

ECONOMIC COUNCIL OF CANADA. *A framework for financial regulation*. Ottawa: Author; distributed by Supply and Services Canada, 1987. Pp. x, 13. \$10.75, paper. ISBN 0-660-12320-7. JEL 87-10

Examination of regulations affecting the activities of Canada's financial intermediaries and agents which includes proposals to improve the effectiveness of regulatory control over the financial system, strengthen public confidence in its stability, strengthen its ability to adapt to the changing needs of the Canadian people, and enable it to compete in rapidly changing international financial markets. Topics include: the changing environment, financial regulation in Canada, competition in the financial system, the soundness of financial institutions, and how well the financial system serves the needs of all Canadians. Also available in French. No index.

GOODHART, CHARLES; CURRIE, DAVID AND LLEWELYN, DAVID T., eds. *The operation and regulation of financial markets*. Studies in Monetary Economics series. London: Macmillan Press in association with the Money Study Group; distributed by Sheidan House, Dobbs Ferry, N.Y., 1987. Pp. xvi, 270. \$45.00. ISBN 0-333-43582-6. JEL 87-10

Second of a new annual series of selected papers given at the regular meetings and annual conference of the Money Study Group. Contains ten papers given at the 1984-85 meetings and the annual conference held at Brasenose College, Oxford, in September 1985. Papers examine: U.K. banking supervision and the Johnson Matthey Affair; structural changes in the British capital markets; personal financial services in the United States; the variability of monetary growth; buffer-stock money; compulsory ratios and reduction in the volume of deposits; rational forecasts in models of the term structure of interest rates; monetary policy, private behavior, and the structure of interest rates in the United Kingdom: 1972-77; and variability in some major U.K. asset markets since the mid-1960s. Contributors are Economists. Goodhart is the Norman Sosnow Professor of Money and Banking at the London School of Economics and Political Science. Currie is Professor of Economics at Queen Mary College, University of London. Llewellyn is Professor of Money and Banking and Head of the Economic Department at Loughborough University. No index.

INGERSOLL, JONATHAN E., JR. *Theory of financial decision making*. Rowman and Littlefield Studies in Financial Economics. Totowa, N.J.: Littlefield, Adams; Rowman and Littlefield, 1987. Pp. xix, 474. \$39.50. ISBN 0-8476-7359-6.

JEL 87-1066

Textbook on the theory of financial economics directed primarily at doctoral students and researchers but also accessible to MBA and undergraduate students with an understanding of basic microeconomic theory and calculus. A mathematical introduction reviews notation, outlines advanced matrix operations, discusses constrained optimization, and examines probability. Discusses utility theory, arbitrage and pricing, portfolio analysis, and the theory of efficient markets. Examines single-period equilibrium models, including mean-variance analysis, the capital asset pricing model, complete markets theory, and general equilibrium considerations in asset pricing. Discusses multiperiod models with consideration given to discrete-time intertemporal portfolio selection, distributions of continuous-time finance, continuous-time portfolio selection, and option pricing. Provides an introduction to stochastic calculus and explores advanced topics in option pricing using Ito calculus. Examines the term structure of interest rates and considers questions of corporate capital structure. Ingersoll is Adrian C. Israel Professor of International Trade and Finance, School of Organization and Management, Yale University. Bibliography; index.

LEVITSKY, JACOB AND PRASAD, RANGA N. *Credit guarantee schemes for small and medium enterprises*. World Bank Technical Paper, no. 58. Industry and Finance Series, vol. 19. Washington, D.C.: World Bank, 1987. Pp. vi, 91. \$5.00, paper. ISBN 0-8213-0866-1.

JEL 87-1067

Provides information on a variety of credit guarantee schemes in twenty-seven developed and developing countries. Examines the essential elements, scope, and variety of such schemes and the problems they face in their operations. Analyzes the design, risk sharing, guarantee fees, handling claims, and financing of such schemes in developed countries in North America, Europe, and Asia and the Pacific and developing countries in Asia, Africa, and Latin America. Contends that efficiently managed guarantee schemes, with a realistic level of fees and revenues from investments, operated with a business approach and assuming only prudent risks, should be able to achieve financial autonomy while assisting small and medium enterprises. Levitsky is an operations adviser and Prasad is a staff member, Industry Department, World Bank. Selected bibliography; no index.

MACESICH, GEORGE. *Monetary policy and rational expectations*. New York and London: Greenwood Press, Praeger, 1987. Pp. x, 154. \$32.95. ISBN 0-275-92327-4.

JEL 87-1068

An analysis of the importance of expectations in formulating and executing monetary policy. Reviews the nature of the debate regarding monetary policy. Examines the international dimension of the search for a monetary regime. Outlines various forms of monetarism and investigates the relationship between monetarists, new classicalism, and rational expectations. Discusses the methodological and business cycle issues related to monetarism. Specifies a money supply equation to decompose the monetary growth rate into anticipated and unanticipated components, and assesses the evidence for the macro rational expectations hypothesis based on cross country data for 50 countries from 1955 to the present. Concludes with an examination of the implications of this debate for monetary policy and econometric modeling. Macesich is Professor of Economics and Director of the Center for Yugoslav-American Studies, Research, and Exchanges, Florida State University. Selected bibliography; index.

MAISEL, SHERMAN J. *Real estate finance*. San Diego; London; Sydney and Toronto: Harcourt Brace Jovanovich, 1987. Pp. xxv, 570. \$34.95. ISBN 0-15-575847-0.

JEL 87-1069

Introductory textbook for courses in real estate finance or investment. Incorporates advances in

the application of new concepts from finance, changes in analytical emphasis resulting from the Tax Reform Act of 1986, and the rapid change in the behavior of lenders. Part 1 provides a background for real estate financing, and examines: mortgages, interest rates, discount rates, present value, debt service, leverage, and rates of return. Part 2 describes the sources and availability of mortgage funds. Part 3 examines the financing of homes from the perspectives of both buyers and lenders. Part 4 discusses in detail the analysis for financing and investing in income properties, and presents several cases illustrating loan and investment analysis, the impact of tax reform, and lending and investing arrangements. Each chapter contains teaching aides, including: objectives, summaries, key terms, and questions. Maisel is Professor of Real Estate and Urban Economics at the University of California, Berkeley. Glossary; index.

- ROSE, PETER S. *The changing structure of American banking*. Columbia Studies in Business, Government, and Society series. New York and Guildford, England: Columbia University Press, 1987. Pp. xii, 419. \$45.00. ISBN 0-213-05980-9.

JEL 87-1070

Examines the changing structure of American banking since World War II. Discusses changes in numbers, relative size, geographic distribution, service, and organizational forms and assesses the impact of these structural changes on bank performance. Topics include: trends in the structure of American banking; bank structure and organization; entry and exit in American banking; the impacts of internal and external growth; concentration in the banking industry; branch banking; the conglomerate bank holding company; competition from nonbank thrift institutions; the rise of non-bank financial conglomerates; and the probable effects and future course of banking deregulation. Rose is Professor of Finance and holder of the Jeanne and John R. Blocker Chair of Business Administration at Texas A&M University. Index.

- SEIVER, DANIEL ALAN. *Outperforming Wall Street: Stock market profits through patience and discipline*. Englewood Cliffs, N.J.: Prentice-Hall, 1987. Pp. x, 208. Paper. ISBN 0-13-645235-3.

JEL 87-1071

Presents the author's patience and discipline (PAD) system for investing in the U.S. stock market. Sets out rules for individual stock selection and portfolio management, focusing on stocks that will outperform the market over the next three to five years. Discusses the best way to buy and sell stocks and describes techniques of market tim-

ing based on indicators to avoid either buying during periods of market overvaluation or selling during periods of market undervaluation. Considers interrelationships between the economy and the stock market, and presents a scenario for the U.S. economy for the rest of the century that is used as a basis for the author's recommendation to concentrate investments in high-technology stocks. Discusses efficient markets theory and offers rules for conservative and aggressive variants of PAD investing. Considers essential elements of stock options and financial futures trading, tax strategy, and information management. Seiver is Professor of Economics at Miami University, Oxford, Ohio. Index.

- SELIGMAN, BARNARD. *Choosing an investment company*. Cambridge, Mass.: Harper and Row, Ballinger, 1987. Pp. xvii, 174. \$29.95. ISBN 0-88730-094-4.

JEL 87-1072

A guide and sourcebook for evaluating investment companies and selecting appropriate funds. Topics include: financial markets; the characteristics of investment companies; bond and stock mutual funds; security selection; portfolio theory and management; performance of bond stock mutual funds; closed-end funds; real estate investment trusts; and financial planning. Seligman is a member of the Lubin Graduate School of Business, Pace University. Index.

- SOLOMON, ELINOR HARRIS, ed. *Electronic funds transfers and payments: The public policy issues*. Norwell, Mass.: Dordrecht and Lancaster: Kluwer Academic, Kluwer-Nijhoff, 1987. Pp. xi, 244. ISBN 0-89838-179-7.

JEL 87-1073

Nine essays examine the developing new financial technology affecting money, banks, and the payments media. Presents a multidisciplinary synthesis to help identify directions of change and major public policy issues. Essays examine money now and in the future; payments and the economic transactions chain; telecommunications policy issues; payment system risk, market failure, and public policy; international payments and electronic fund transfer links; monetary rules and control; monetary modeling in a world of financial innovation; new money and the old monopoly problem; and a consumer's view of electronic fund transfer. Solomon is Professor of Economics at the George Washington University. Index.

- TOMA, EUGENIA FROEDGE AND TOMA, MARK, eds. *Central bankers, bureaucratic incentives, and monetary policy*. Financial and Monetary Policy Studies series, vol. 13. Hingham, Mass., Dor-

drecht and Lancaster: Kluwer Academic, 1986. Pp. xiv, 251. \$57.50. ISBN 90-247-3366-9.

JEL 87-1074

Eleven papers, most previously published, examine the behavior of central banks. Part 1 focuses on the structure of central bank financing and bureaucratic rents, and discusses: the theory and practice of monetary policy; inflationary bias in the Federal Reserve System; and the use of inputs in the Federal Reserve System. Part 2 deals with the organization of central bank bureaus and problems of control, and covers: bureaucratic theory and the choice of central bank goals and instruments; research activities and budget allocations among Federal Reserve Banks; and banking sector influence on the relationship between Congress and the Federal Reserve System. Part 3 examines: the role of politics on policy making; an international comparison of central bank independence; and the possibility of a private central bank. The contributors are economists. E. F. Toma and M. Toma are members of the Departments of Economics at Auburn University and Miami University, respectively. No index.

WALTER, INGO, ed. *Deregulating Wall Street: Commercial bank penetration of the corporate securities market*. Wiley Professional Banking and Finance Series. New York; Chichester; Brisbane and Toronto: Wiley, 1985. Pp. xii, 315. ISBN 0-471-81713-9.

JEL 87-1075

Ten papers assess the impact of excluding commercial banks from originating, underwriting, and dealing in financial securities. Papers discuss: the role of banks in the economy; the legislative history of the Glass-Steagall Act; the performance of bank securities activities before 1933; the competitive effects of allowing commercial bank affiliates to underwrite corporate securities; the riskiness of equity underwriting by commercial bank affiliates; bank safety and soundness and the risks of corporate securities activities; the economic and legal aspects of possible conflicts of interest; the behavior of Eurobond markets where there is no separation of commercial and investment banking; and the implications for policy. The papers argue that the benefits of deregulation would significantly outweigh its costs. The contributors include economists. Walter is Professor of Economics and Finance at New York University. Index.

WILCOX, JAMES A., ed. *Current readings on money, banking, and financial markets*. FREDERIC S. MISHKIN, Consulting Editor. Boston and Toronto: Little, Brown, 1987. Pp. xii, 356. Paper. ISBN 0-316-94020-8.

JEL 87-1076

Thirty-five papers, all previously published, discuss current issues in monetary theory and policy, and finance. Designed for courses in undergraduate economics departments and business schools as well as MBA programs. Part 1 focuses on financial markets and interest rates. Part 2 deals with insurance and regulation of financial institutions as well as bank failures. Part 3 examines the need for redefinition of money, changes in the money supply, and the evolution of electronic fund transfer networks. Part 4 analyzes central banking and the conduct of monetary policy. Part 5 discusses recent developments in monetary theory, and part 6 deals with international finance. The contributors are mainly economists. Wilcox is at the School of Business Administration at the University of California, Berkeley. No index.

See also: Book Numbers JEL 87-0998, 87-1056, 87-1058, 87-1065, 87-1070, 87-1075, 87-1080, 87-1131

### 320 FISCAL THEORY AND POLICY; PUBLIC FINANCE

ARONSON, J. RICHARDS AND SCHWARTZ, ELI, eds. *Management policies in local government finance*. Third edition. Municipal Management Series. Washington, D.C.: International City Management Association for the ICMA Training Institute, [1975 . . . 1981] 1987. Pp. 449. \$19.95. ISBN 0-87326-075-9.

JEL 87-1077

The third edition of this textbook on municipal finance has been expanded and updated. Part 1 is devoted to the local government setting and covers the finance function; fiscal problems of the fragmented metropolis; fiscal structure in the federal system; and local government revenues and expenditures. Part 2 deals with management tools and covers forecasting; budgeting; financial accounting, reporting, and auditing; and computer applications. Part 3 examines revenue sources including property taxes; nonproperty taxes; and user charges and special districts. Part 4 analyzes financial management and covers debt management; public pension fund administration; inventory and cash management; purchasing and risk management; unions, wages, and local government finance; and capital budgeting. The contributors are mainly economists. Aronson and Schwartz are professors at Lehigh University. Selected bibliography; index.

AUERBACH, ALAN J. AND KOTLIKOFF, LAURENCE J. *Dynamic fiscal policy*. Cambridge; New York and Melbourne: Cambridge University Press, 1987. Pp. xv, 196. \$32.50. ISBN 0-521-30041-X.

JEL 87-1078

Analysis of the impact of fiscal policy on dynamic processes in the economy. Employs a dynamic, perfect foresight, general equilibrium, life-cycle model to examine various issues relevant to dynamic fiscal policy. Introduces and describes the general model in detail. Discusses simulation methodology and conducts simulation analysis to examine various fiscal policies including: tax reform; deficit financing; progressive taxation; investment incentives; and social security. Evaluates recent fiscal policy and speculates on its future content. Auerbach is Professor of Economics at the University of Pennsylvania. Kotlikoff is Professor of Economics at Boston University. Index.

BOSWORTH, BARRY P.; CARRON, ANDREW S. AND RHYNE, ELISABETH H. *The economics of federal credit programs*. Washington, D.C.: Brookings Institution, 1987. Pp. xii, 214. ISBN 0-8157-1038-0. JEL 87-1079

An analysis of the economic justifications for government credit programs. Examines and assesses the forms, rationale, evolution, and current need for government credit programs. Evaluates the economic effects of government credit and reviews loan programs in four areas—housing, small business, agriculture, and education. Examines the process of accounting and budgeting for credit programs, and new directions in government credit. Bosworth is Senior Fellow in the Brookings Economic Studies program. Carron is Vice President of First Boston Corporation. Rhyme is Project Development Advisor for the U.S. Agency for International Development in Kenya. Index.

CAMPAGNA, ANTHONY S. *U.S. national economic policy, 1917-1985*. New York and London: Praeger, 1987. Pp. xix, 642. \$55.00. ISBN 0-275-92428-2. JEL 87-1080

Provides a survey of macroeconomic policy making over most of the twentieth century "spanning the period when monetary institutions, tax law, and budgetary procedures, which make economic policy feasible, if not always acceptable, were in place." Examines major policies in terms of periods described by the political administrations. Discusses major economic problems during each of these, emphasizing what was done and the degree of success. Evaluates policies in terms of the prevailing economic orthodoxy. Organizes presentation around three questions: were the policies justified, successful, and rational. Part 1 presents the overall record of the U.S. economy from the beginning of the century, emphasizing events since the end of World War I. Part 2 covers the Great Depression, World War II, and the Truman administration, noting the acceptance of government inter-

vention in economic affairs. Part 3 extends the analysis to the Eisenhower years, Kennedy and the New Frontier, and Johnson and the Great Society. Part 4 treats economic policy in a changing world, discussing Nixon and the "Imperial Presidency," the Ford administration, and the Carter and Reagan years. The last part presents suggestions about the future of economic policy making and how it can be improved. Campagna is Professor of Economics at the University of Vermont. Bibliography; index.

LEWIS, GORDON H. AND MORRISON, RICHARD J. *Income transfer analysis*. New York: Immergut and Siolek, 1987. Pp. xx, 337. \$49.50. ISBN 0-915163-01-2. JEL 87-1081

Presents a conceptual framework for the analysis of the impact of government programs for income security and taxation on individuals and families. Outlines the key elements of a potential software system for such analysis and describes a specific software system, MAPSIT, that is currently available. Part 1 discusses problems of income transfer analysis and outlines the basic approach and design criteria. Part 2 describes the MAPSIT package, presents examples of its use in modeling income in transfer systems, discusses formats for secondary analysis, and describes other MAPSIT features. Part 3 focuses on applications and issues, and covers: elements of modeling practice; the uses and applications of MAPSIT; and problems and potentials with regard to policy usage. Lewis is at Carnegie-Mellon University. Morrison is associated with the Canadian Department of Health and Welfare. Index.

McLURE, CHARLES E., JR. *The value-added tax: Key to deficit reduction?* With a commentary by MARK A. BLOOMFIELD. AEI Studies in Fiscal Policy series, no. 450. Washington, D.C.: American Enterprise Institute for Public Policy Research; distributed by University Press of America, Lanham, Md., 1987. Pp. xi, 184. \$21.00, cloth; \$10.75, paper. ISBN 0-8447-3614-7, pbk. JEL 87-1082

Expands and updates the author's earlier discussion of the value-added tax (VAT), published in 1972. Describes the design and functioning as well as the economic effects of such a tax. Examines how this type of tax would affect international competitiveness, the distribution of the tax burden, and state and local taxes. Reviews alternative revenue sources and issues in the design of a value-added tax. Compares the VAT with other forms of general sales tax. Discusses possible ways of dealing with particular problem industries and issues of intergovernmental relations posed by a VAT. Includes an essay on the case for a value-

added tax by Mark A. Bloomfield. McLure is a Senior Fellow at the Hoover Institution. Index.

PECHMAN, JOSEPH A., ed. *Tax reform and the U.S. economy*. Brookings Dialogues on Public Policy series. Washington, D.C.: Brookings Institution, 1987. Pp. ix, 107. Paper. ISBN 0-8157-6959-8.  
JEL 87-1083

Four papers, and comments, given at a conference at the Brookings Institution in December 1986, outline the major features of the tax reform of 1986 and assess its potential economic effects. Henry J. Aaron describes the important provisions of the tax bill, its major accomplishments, and missed opportunities. Larry I. Dildine examines the impact of the bill on American industry, and Eugene Steuerle analyzes the effect of the tax law on financial decisions. Patric H. Hendershott, James R. Follain, and David C. Ling estimate the impact of the bill on housing and real estate markets. Pechman is associated with the Brookings Institution. No index.

RAZIN, ASSAF AND SADKA, EFRAIM, eds. *Economic policy in theory and practice*. New York: St. Martin's Press, 1987. Pp. xli, 552. \$32.50. ISBN 0-312-23453-8.  
JEL 87-1084

Fourteen papers with comments presented at a conference on economic policy in theory and practice held in May 1984 at Tel-Aviv University in memory of Abba P. Lerner (1903-1982). Contributions examine: the economics of public deficits; the international transmission of the effects of fiscal outlays and budget deficits; fiscal policy in open, interdependent economies; optimal currency substitution policy and public finance; inflation and the government budget constraint; international capital flows and the world debt problem; capital flows between developing and developed countries; the political economy of Leviathan; capital gain taxation on non-Austrian assets; right of way and congestion toll; corporate taxation in the United States; a dynamic model of the effect of labor unions on investment in training; corporate governance and market structure; and vertical integration and the distribution of property rights. Contributors are economists. Razin and Sadka are Professors of Economics at Tel-Aviv University. Author index.

UNITED NATIONS, DEPARTMENT OF TECHNICAL CO-OPERATION FOR DEVELOPMENT, DEVELOPMENT ADMINISTRATION DIVISION. *The role of the public sector in the mobilization of domestic financial resources in developing countries*. New York: United Nations, 1986. Pp. 148. \$9.00, paper.  
JEL 87-1085

Report and background papers of an interregional seminar on the role of the public sector in the mobilization of domestic financial resources for social and economic development of developing countries that was sponsored by the United Nations Department of Technical Co-operation for Development and held at the headquarters of the Economic and Social Commission for Asia and the Pacific in Bangkok, Thailand, in December 1985. Part 1 is the seminar report adopted by the participants and focuses on: the trends and structural changes in resource mobilization in the public sector; budgetary policy in developing countries; domestic resource mobilization—financial institutions and policy; and surplus generation by public enterprises for national economic development. Part 2 contains four background papers on the above topics. Also available in Arabic, Chinese, French, Spanish, and Russian. No index.

WILDASIN, DAVID E. *Urban public finance*. Fundamentals of Pure and Applied Economics series, Regional and Urban Economics section, vol. 10. Chur, Switzerland; London; Paris and New York: Harwood Academic, 1986. Pp. viii, 175. \$15.00, paper. ISBN 3-7186-0334-9.  
JEL 87-1086

Reviews current developments in urban public finance. Discusses basic principles of resource allocation in economies with local governments, focusing on: locational efficiency, positive and normative analysis of local public expenditure, and Tiebout models of household mobility and public expenditure. Evaluates the distributive and efficiency effects of property taxation and examines the question of land value taxation. Considers various intergovernmental fiscal relations such as: interjurisdictional benefit spillovers; tax exporting, tax competition, and optimal local taxation; household mobility; and intergovernmental transfers. Wildasin is Associate Professor of Economics, Indiana University. Index.

WORLD BANK. *Haiti: Public expenditure review*. World Bank Country Study series. Washington, D.C.: World Bank, 1987. Pp. xix, 254. \$15.00, paper. ISBN 0-8213-0872-6.  
JEL 87-1087

Analyzes public expenditure in Haiti from a development perspective; based on a World Bank mission in October-November 1985. Reviews public expenditure in the context of economic stagnation, the need for structural reform, and a proposal that Haiti adopt a three-year rolling investment program. Discusses: the level and control of recurrent and investment public expenditure, including public sector employment; the role of aid donors; and the agricultural, public industrial enterprises, electric power, transport, telecommunications, ur-

ban, water supply, education, and health sectors. Recommends a public expenditure program for FY 86-89; also contains sector-specific recommendations. About half of the book consists of economic projections, a statistical appendix, and project-by-project data. No index.

#### 400 International Economics

GILPIN, ROBERT. *The political economy of international relations*. With the assistance of JEAN M. GILPIN. Princeton, N.J.: Princeton University Press, 1987. Pp. xvi, 449. \$45.00, cloth; \$9.95, paper. ISBN 0-691-07732-0. JEL 87-1088

Analysis of the political and economic aspects of international relations. Defines international political economy as the interaction between the state and the market, and evaluates the liberal, nationalist, and Marxist perspective on this interaction. Examines the dynamics of the international political economy, and the evolution and characteristics of the international monetary system. Discusses key issues relevant to the politics of international trade, and analyzes the role of multinational corporations and international production. Addresses the issue of dependency and economic development and describes the political economy of international finance. Reviews recent structural changes in the global political economy and considers the impact of the emergent international economic order. Gilpin is Dwight D. Eisenhower Professor of International Affairs at Princeton University. Index.

KREININ, MORDECHAI E. *International economics: A policy approach*. Fifth edition. San Diego; London; Sydney and Toronto: Harcourt Brace Jovanovich, Academic Press, [1971 . . . 1983] 1987. Pp. xiii, 465. \$32.95. ISBN 0-15-541538-7.

JEL 87-1089

Fifth edition of this textbook has been revised and updated to incorporate major events in the international economy that have occurred since the publication of the fourth edition. These events include: the rise and decline in the value of the dollar, the oil glut, external debt of less developed countries, the rise of protectionism, and the new round of trade negotiations. New topics include: sector specific factors, international trade under monopolistic competition, export subsidies, trade policy under oligopoly, and the political economy of protectionism. End-of-chapter review questions have been added to assist students in identifying

and retaining key concepts. [For annotation of previous edition see JEL no. 84-0151.] Kreinin is at Michigan State University. Bibliography; index.

UNITED NATIONS, DEPARTMENT OF ECONOMIC AND SOCIAL AFFAIRS. *World economic survey 1986: Current trends and policies in the world economy*. U.N. Publications Sales No. E.86.II.C.1. New York: United Nations, 1986. Pp. x, 177. Paper. ISBN 92-1-109110-1. JEL 87-1090

Overviews the world economy in 1985 and early 1986 and makes projections for 1986 and 1987. The general theme of this year's annual survey is the interaction between the recent shift in perceptions and the domestic actions and cooperative international policy initiatives taken in 1985 with the changes in underlying economic conditions in the world economy. Analyzes reasons for the growth retardation in 1985, projects continuing large imbalances into 1986 and 1987, and estimates the impact of a further decline in oil prices and further depreciation of the dollar. Considers: the reduction in responsiveness of international trade to world output; world payments imbalances; the strengthening of the international trading system and reform of the international monetary system; and relationships between capital formation and adjustment in developing, centrally planned, and major industrial countries. The last chapter addresses the critical economic situation in Sub-Saharan Africa as the major development challenge of the present decade. Statistical annexes. Also available in French, Russian, and Spanish. No index.

#### 410 INTERNATIONAL TRADE THEORY

BHAGWATI, JAGDISH. *The theory of commercial policy: Essays in international economic theory*. Volume 1. Paperback reprint. Edited by ROBERT C. FEENSTRA. Cambridge, Mass. and London: MIT Press, [1983] 1987. Pp. xi, 628. Paper. ISBN 0-262-52120-2. JEL 87-1091

Paperback reprint of the first of two volumes containing a selection of the author's writings in the theory of international trade and commercial policy since 1958. [See JEL no. 84-0453 for annotation of original edition.]

ITALIANER, ALEXANDER. *Theory and practice of international trade linkage models*. Advanced Studies in Theoretical and Applied Econometrics series, vol. 9. Norwell, Mass.; Dordrecht and Lancaster: Kluwer Academic, Martinus Nijhoff, 1986. Pp. xi, 393. ISBN 90-247-3407-X. JEL 87-1092

Discusses the econometric modeling of international trade linkages. Reviews existing trade link-

age models, develops the theory needed to derive estimation-consistent import allocation models in a framework of neoclassical optimization, and presents and tests a new import allocation model based on the CRESH aggregator function. Chapters examine the linkage system, import allocation models, the use of elasticities of substitution, maximum likelihood estimation of nonlinear models with linear constraints on the functional form, and the economic specification, data, estimation, and hypothesis testing of the new model presented. Provides an overview of the results and presents suggestions for further research. Author and subject indexes.

#### 420 TRADE RELATIONS; COMMERCIAL POLICY; INTERNATIONAL ECONOMIC INTEGRATION

BRADFORD, COLIN I., JR., AND BRANSON, WILLIAM H., eds. *Trade and structural change in Pacific Asia*. National Bureau of Economic Research Conference Report series. Chicago and London: University of Chicago Press, 1987. Pp. xix, 558. \$58.00. ISBN 0-226-07025-5. JEL 87-1093

Sixteen papers originally presented at a conference organized by the National Bureau of Economic Research and entitled "Global Implications of the Trade Patterns of East and Southeast Asia." The conference was held in Kuala Lumpur, Malaysia, in January of 1984. Addresses two main themes: how South Korea, Taiwan, Hong Kong, and Singapore emerged as major manufacturing centers and the degree to which Malaysia, Thailand, the Philippines, and Indonesia will follow a similar path of development. The introductory chapter by the editors integrates the main points that emerged from conference discussions. Five papers consider the role of Pacific Asia in global trade patterns with respect to the United States, the European Community, and Japan, as well as the implications of recent U.S. trade policy and Project Link. Three papers examine structural change and transitional growth in the region. The remaining papers examine trade patterns and trends in eight Asian countries. Bradford is Associate Director, Yale Center for International and Area Studies, Yale University. Branson is Professor of Economics and International Affairs, Woodrow Wilson School of Public and International Affairs, Princeton University. Author and subject indexes.

CASTILLO, CARLOS MANUEL. *The economic integration of Central America in its next stage: Problems and opportunities*. Washington, D.C.: Interamerican Development Bank, Institute for Latin Ameri-

can Development (INTAL), 1986. Pp. iv, 79. Paper. JEL 87-1094

Presents the outlines of a regional cooperation program for the five countries of Central America based on a meeting of Central American experts held by the Institute for Latin American Integration (INTAL) in Tegucigalpa, Honduras, in December 1985. Proposes that the Central American crisis is all-embracing and imperils the political and economic viability of the countries in the region. Argues that it is possible to recover from it by means of an integral reconstruction process. Discusses reconstruction of on a new economic pattern, on reorientation of the regional economic space, integration and economic reconstruction, integration and social development, and implementation of the next integration stage. No index.

HAYES, J. P. *Economic effects of sanctions on Southern Africa*. Thames Essay series, no. 53. Aldershot, England; Brookfield, Vt.; Hong Kong and Sydney: Gower for the Trade Policy Research Centre, London, 1987. Pp. xii, 100. £7.95, paper. ISBN 0-566-05539-2. JEL 87-1095

Analysis of the potential economic effects of sanctions on South Africa, neighboring countries, and the countries imposing sanctions. Reviews the arguments regarding the imposition and effectiveness of sanctions. Examines the history of economic sanctions against South Africa up to February 1987 and assesses the possible nature, extent, and future escalation of those sanctions. An appendix presents a model to assess the nature and extent of adjustment in the South African economy in the face of sanctions. Hayes is Senior Fellow at the Trade Policy Research Centre, London. No index.

INSTITUTE FOR LATIN AMERICAN INTEGRATION AND INTER-AMERICAN DEVELOPMENT BANK. *The Latin American integration process in 1984*. Buenos Aires: Institute for Latin American Integration, 1987. Pp. 400. Paper. JEL 87-1096

This annual report assesses the status of Latin American economic integration and cooperation. Reviews developments in the world and Latin American economies during 1984 and explores the institutional, trade, aid, legal, economic, and monetary and financial aspects of the Latin American Integration Association (LAIA) as well as the Andean Group, the Central American Common Market, and the Caribbean Community. Evaluates the Latin American Economic Conference at Quito, assesses the Latin American Economic System countries' position in economic relations with industrialized countries and at international economic forums, and examines the state of intraregional cooperation. Examines financial

cooperation, and the nature of multilateral programs and other forms of cooperation. Presents an evaluation of the process of integration and a chronology of main regional integration events in 1984. No index.

KAKABADSE, MARIO A. *International trade in services: Prospects for liberalization in the 1990s*. Atlantic Paper series, no. 64. London; New York and Sydney: Croom Helm for the Atlantic Institute for International Affairs, 1987. Pp. 90. £7.95, paper. ISBN 0-7099-3130-1. JEL 87-1097

Analysis of the key issues associated with the expansion of international trade in services. Examines the changing role of services in national economies and the associated changes in the character of service industries. Describes the evolution of the new international service economy and outlines the policy issues and perspectives relevant to attempts at trade liberalization. Outlines a possible work program for services trade negotiations. Argues that successful negotiation of rules for trade in international services depends on the existence of real political commitment on the part of governments. Kakabadse is Research Associate at the Atlantic Institute for International Affairs. No index.

PREEG, ERNEST H. AND BENDAHMANE, DIANE B., eds. *New dimensions in foreign economic policy: Industrial-oil-banking*. Washington, D.C.: U.S. Department of State, Foreign Service Institute, Center for the Study of Foreign Affairs, 1986. Pp. xiii, 118. \$3.75, paper. JEL 87-1098

Twenty-three articles, originally presented at three symposia on foreign economic policy held at the Center for the Study of Foreign Affairs, examine recent changes in energy prospects and policy, international banking, and national industrial policy and the international economic system. An overview examines the decade of the 1970s during which the new era originated. Part one, dealing with energy prospects and policy ten years after the first oil shock, discusses: the world oil market, energy security, and U.S. interests and foreign policy concerns. Part 2 is concerned with international banking and the debt crisis, and examines: the prospects for lending to the LDCs, international financial institutions and the role of commercial financing, U.S. interests and policy implications, and a desirable structure for official and commercial lending to developing countries. Part 3, dealing with national industrial policy and the international economic system, reviews experiences in Japan, France, South Korea, and Brazil and presents implications for U.S. trade and aid policy. Preeg is a visiting fellow at the Center for the Study of Foreign Affairs. Bendahmane is a Washington-

based editor and publications specialist. Bibliography; no index.

RUBNER, ALEX. *The export cult: A global display of economic distortions*. Boulder, Colo.: Westview Press; Aldershot, England: Gower, 1987. Pp. xiv, 318. \$37.50. ISBN 0-8133-0514-4.

JEL 87-1099

Examines the validity of the arguments for export promotions. Describes the general picture of export subsidies and discusses the use of VALAD, a measure of net foreign currency value of a unit of export, to determine whether the activity profits the exporting country. Examines a wide range of techniques to encourage exports such as subsidies, exchange rate manipulation, insurance, subsidized credit, and tax incentives. Discusses the adverse impacts of various export incentives on the economy. Reviews alternatives and makes conjectures about the role of exports in the 1990s in OECD countries. Appendices contain supporting materials and case studies. Rubner is an economic consultant and writer on economics. Index.

See also: Book Numbers JEL 87-1010, 87-1015, 87-1033, 87-1035, 87-1044, 87-1091, 87-1120, 87-1139, 87-1170

#### 430 OPEN ECONOMY MACROECONOMICS; EXCHANGE RATES; INTERNATIONAL FINANCE

BALASSA, BELA AND WILLIAMSON, JOHN. *Adjusting to success: Balance of payments policy in the East Asian NICs*. Policy Analyses in International Economics series, no. 17. Washington, D.C.: Institute for International Economics, 1987. Pp. x, 121. \$10.00, paper. ISBN 0-88132-061-7.

JEL 87-1100

An evaluation of the economic and financial condition of Asian newly industrializing countries within the context of their developmental requirements. Discusses balance-of-payments targets and policies, and highlights: optimal foreign borrowing and lending; exchange rate protection; and adjustment policies. Presents a comparative perspective on the development experience of Hong Kong, Singapore, South Korea, and Taiwan, focusing on the reasons for their economic success, policies, and recent changes in exchange rates. Details trends in exchange rates, saving and investment rates, and other economic indicators for these countries and discusses their role in the global adjustment process. Appendices discuss key issues relevant to the calculation and use of exchange rates and the estimation of the effect of exchange-rate changes. Balassa is Professor of Political Economy at the Johns Hopkins University. Williamson is Senior Fellow at the Institute for International Economics. No index.

IE, WILLIAM R. *Mobilizing bank lending to debtor countries*. Policy Analyses in International Economics series, no. 18. Washington, D.C.: Institute for International Economics, 1987. Pp. viii, 100. \$10.00, paper. ISBN 0-88132-062-5.

JEL 87-1101

Analysis of the possibilities for increased mobilization of new financing to debtor countries from private banks. Outlines the policy setting for this initiative as part of the strategy of debt management. Presents a proposal for new-money packages that would choose the financing mechanism according to the preferences of different classes of banks. Describes the mechanism in this package that would permit voluntary exit as well as the mechanism for enforcement. Discusses how such a package would fulfill the objectives of meeting cash flow needs and equivalent burden sharing as well as monitoring requirements. Reviews the domestic monetary implications of lending options and discusses the future direction of debt management. Appendices present a brief overview of the debt problem in early 1987, and debt strategy and proposals for relief. Cline is Senior Fellow at the Institute for International Economics. No index.

FEY, PETER. *The European monetary system—past, present and future*. Second revised edition. Dordrecht and Lancaster: Kluwer Academic, [1984] 1987. Pp. x, 163. \$33.50. BN 90-247-3446-0.

JEL 87-1102

Assesses structural changes that have taken place in the European Monetary System (EMS) since the first edition and incorporates proposals that have been made for the future of the system. [See JEL no. 85-1064 for annotation of first edition.] Only minor additions have been made to the text of the first edition and an assessment of recent changes and proposals is placed in a supplement following the original text. Credits the EMS as the real success story of the Common Market since the First Enlargement and places the experience in a major historical context wherein the System is viewed as a transitional phase on the way to implementing a full economic and monetary union. Fey is Head of the Economics Section of the Europa Institute, University of Amsterdam. Index.

EDWARDS, SEBASTIAN AND EDWARDS, ALEJANDRA. *Monetarism and liberalization: The Chilean experiment*. Cambridge, Mass.: Harper and Row, 1987. Pp. xxi, 233. \$29.95. ISBN 0-03-0730-105-3.

JEL 87-1103

Analyzes the problems and achievements of Chile's economic experiment in detail, emphasizing the role of policy mistakes in the final disappointing outcome of the liberalization program. Presents

background information and an overview of the experiment designed to liberalize the economy through reforms directed at increasing the role of the market mechanism and reducing existing barriers to international trade and capital movements. Explains why the experiment collapsed by 1982 when Chile entered into a deep recession. Analyzes the military stabilization program and the behavior of the interest rate and the real exchange rate. Discusses privatization and deregulation, and aspects of the liberalization of international trade. Develops a model of the labor market to explain the persistence of unemployment and examines the sequencing of the liberalization reforms. Concludes with a discussion of the lessons learned from the Chilean experience. S. Edwards is Associate Professor of Economics at the University of California, Los Angeles. A. Edwards is an assistant professor at California State University, Long Beach. Bibliography; index.

FRIEDMAN, IRVING S. *Toward world prosperity: Reshaping the global money system*. Lexington, Mass. and Toronto: Heath, Lexington Books, 1987. Pp. xiii, 317. \$24.95. ISBN 0-669-11564-9.

JEL 87-1104

Sets forth the author's views about remedying the failures of the global financial system in meeting the needs of the third world. Examines the breakdown of the system; the world economy and the mixed international financial system; conceptions and misconceptions of international banking; sources of international finance; origins of the debt crisis of the 1980s; responses to the crisis; implications of the current crisis for the restoration of creditworthiness; and preconditions for the restoration of creditworthiness. Presents proposals for strengthening the international financial system and discusses the need for a new Bretton Woods Conference. Friedman has served a number of financial institutions, including the U.S. Treasury, the World Bank, the International Monetary Fund, and Citicorp. Glossary; index.

HILDEBRAND, JOHN R. *Monetary integration: Key currencies contributing equitably to development*. Bristol, Ind.: Wyndham Hall Press, 1987. Pp. viii, 81. \$12.95, paper. ISBN 1-55605-004-0.

JEL 87-1105

Analysis of the progress of monetary integration in different areas of the world. Examines Central American currency problems and global and regional problems associated with monetary integration between Panama and Central America. Assesses the experience of monetary integration between the United States, the Dominican Republic, and Liberia. Discusses the problem of distribu-

tion of seigniorage gains and evaluates future prospects for monetary integration. Index.

- MYERS, ROBERT J., ed. *The political morality of the International Monetary Fund: Ethics and foreign policy*. Volume 3. New Brunswick, N.J. and Oxford: Transaction Books for the Carnegie Council on Ethics and International Affairs, 1987. Pp. 184. \$24.95, cloth; \$14.95, paper. ISBN 0-88738-674-1, pbk. JEL 87-1106

Eleven papers analyze the recent approach of the IMF and possible means of improving its methods of assisting financially troubled governments. Topics include: possible reforms of the IMF; a founder's evaluation; a critique of IMF conditionality; a U.S. labor perspective on the IMF's role in the international economy; a critique of the IMF's operation in Africa; the debt crisis; the ideological proclivities and political dilemmas of the IMF; the impact of IMF conditionality on agriculture in developing countries; the role of the IMF as market maker for official business between nations; an analysis of the new role of the IMF; and an assessment of the Baker plan. The contributors are mainly economists. Myers is President of the Carnegie Council on Ethics and International Affairs, New York City. Index.

- PATRICK, HUGH T. AND TACHI, RYUICHIRO, eds. *Japan and the United States today: Exchange rates, macroeconomic policies, and financial market innovations*. New York: Center on Japanese Economy and Business, Columbia University, 1987. Pp. vii, 234. \$25.00. ISBN 0-231-06575-2. JEL 87-1107

Sixteen papers and comments presented at a conference held in New York City in June 1986. Part 1 focuses on macroeconomic policy and performance, and reviews the prospects for redressing current account imbalances by appropriate macroeconomic policies in Japan and the United States. Part 2 deals with recent developments in the yen-dollar relationship and discusses its antecedents, its implications for the U.S.-Japan relationship, and the prospects for exchange rate stability. Part 3 discusses financial market innovations and focuses on: present and future conditions; the internationalization of investment banking; comparative studies of financial innovation, deregulation, and reform in Japan and the United States; and Japanese financial liberalization. Part 4 examines asymmetry of institutional features as a source of trade frictions and assesses the political implications of U.S.-Japan economic relations. The contributors are mainly economists and businessmen. Patrick is R. D. Callins Professor of International Business and Director of the Center on Japanese Economy and Business, Graduate School of Business, Co-

lumbia University. Tachi is President of the Institute of Fiscal and Monetary Policy, Japan Ministry of Finance. No index.

- POOL, JOHN CHARLES AND STAMOS, STEVE. *The ABCs of international finance: Understanding the trade and debt crisis*. Lexington, Mass. and Toronto: Heath, Lexington Books, 1987. Pp. xii, 138. \$23.00. ISBN 0-669-15605-1. JEL 87-1108

Analysis of the nature of the international financial sector in the twentieth century, focusing on: the fluctuations of the U.S. dollar; the effect and consequences of the changes in oil prices; the origins and effects of the third world debt crisis; and the antecedents and causes of the U.S. trade problem. Reviews the theoretical view of international trade and finance, and outlines the historical evolution of the international monetary system. Analyzes the causes and consequences of the U.S., third world, and Mexican debt crises. Concludes with an examination of the prospects of future debt crises and the limits of orthodox policy. Pool is head of Charles Pool and Associates, Rochester, New York. Stamos is Associate Professor of Economics at Bucknell University. Index.

- SCAMMELL, W. M. *The stability of the international monetary system*. Totowa, N.J.: Littlefield, Adams; Rowman and Littlefield, 1987. Pp. viii, 162. \$29.50, cloth; \$11.95, paper. ISBN 0-8476-7541-6, pbk. JEL 87-1109

Examination of the international monetary system. Discusses the necessities of the system and traces its evolution. Analyzes the nature of international money and alternative approaches to setting exchange rates. Describes various theoretical approaches to adjustment. Reviews the role and mechanism of capital flows and the nature of control of the international monetary system. Concludes that the international monetary system is more stable and amenable to control than would appear at first sight. Scammell is Professor of Economics at McMaster University, Ontario. Index.

- ZERBATO, MICHEL, ed. *Keynésianisme et sortie de crise: Keynes contre le libéralisme? (Keynesianism and crisis end: Keynes against liberalism?)*. Paris: Dunod; distributed in North America by Diffusion, Montreal, 1987. Pp. viii, 268. Fr 145.00, Can\$ 42.00, paper. ISBN 2-04-016957-1. JEL 87-1110

Thirteen economists address the issue of renewed Keynesian policy. Following a review of Keynes's global vision of the economy, they argue that his interventionism was not to be conceived as a gradual shift toward socialism, but rather a search for full employment in a framework of a free-market system. They re-examine the recent

difficulties of effective Keynesian policy by studying the rigidity of supply and the destabilization of global demand caused by interdependency of world economies, particularly with respect to the systems of payments. The third part proposes a reform of the international monetary system as a requirement for an effective Keynesian policy. Zerbato is at the University of Bordeaux. Subject index. [Jean Mirucki]

#### 440 INTERNATIONAL INVESTMENT AND FOREIGN AID

BHAGWATI, JAGDISH. *International factor mobility: Essays in international economic theory*. Volume 2. Paperback reprint. Edited by ROBERT C. FEENSTRA. Cambridge, Mass. and London: MIT Press, [1983] 1987. Pp. x, 562. Paper. ISBN 0-262-51211-0. JEL 87-1111

Paperback reprint of the second of two volumes of selected essays on international trade focusing on international factor mobility. [See JEL no. 84-0481 for annotation of original edition.]

BIERSTEKER, THOMAS J. *Multinationals, the state, and control of the Nigerian economy*. Princeton: Princeton University Press, 1987. Pp. xvii, 344. \$45.00, cloth; \$12.50, paper. ISBN 0-691-07728-2. JEL 87-1112

Examines Nigeria's experience with indigenization and control of its national economy. Reviews six alternative theoretical approaches to international political economy, including: conservative neoclassical realism, liberal internationalism, structuralism, vulgar and sophisticated dependencistas, and classical Marxism. Examines the sources, objectives, and consequences of Nigeria's two-phased indigenization program. Discusses: the first indigenization decree and fronting, commercial consolidation, and inequality; the second indigenization decree and the state as initiator; multinational responses to the second decree; and the control of finance and the development of capitalism in Nigeria. Biersteker is Associate Professor in the School of International Relations and Director of the Center for International Studies, University of Southern California. Bibliography; index.

CASSON, MARK. *The firm and the market: Studies on multinational enterprise and the scope of the firm*. Cambridge, Mass.: MIT Press, 1987. Pp. xii, 283. \$27.50. ISBN 0-262-03129-0. JEL 87-1113

Develops the modern theory of the multinational enterprise (MNE) to encompass the firm in gen-

eral. Extends the analysis of the MNE to incorporate contemporary phenomena, such as strategic rivalry between MNEs and the restructuring of their global operations. Contends that, when extended along these lines, the analysis of the MNE provides the basis for a general theory of corporate organization over space, and shows that the ramifications of the theory of the MNE go well beyond the areas to which it traditionally has been applied. Illustrates how the theory can be used for case study investigations and for formulations of policy. Includes discussions of applications of the analysis of quality control to the construction industry in the United Kingdom, vertical integration in the shipping industry, and foreign divestment and rationalization in the motor industry. Considers areas of future research needed to understand the forces affecting the evolution and growth of the MNE. Casson is Professor of Economics, University of Reading. Bibliography; index.

DAVIS, E. P. *Rising sectoral debt/income ratios: A cause for concern?* BIS Economic Papers series, no. 20. Basel, Switzerland: Bank for International Settlements, Monetary and Economic Department, 1987. Pp. 101. Paper. JEL 87-1114

Analysis of the impact of the rising ratio of debt to income in both the public and private sectors. Outlines the causes of growing debt and the concerns of monetary authorities in this regard. Documents debt-income ratios for 1966-85 for the United States, the United Kingdom, West Germany, Japan, and Canada. Presents a theoretical analysis of the relationship between debt and stability, and examines: the determinants of interest rates on debt; the issue of bankruptcy; and the sectoral demand for credit. Discusses the experience of major economies with the relationship between debt and financial stability. Conducts an econometric analysis of the determinants of lending risk and interest rates. Concludes that concerns regarding rising debt-income ratios are justified and outlines issues relevant to planned policy responses. Davis is a member of the Monetary and Economic Department of the Bank for International Settlements. No index.

DE LUPIS, INGRID DETTER. *Finance and protection of investment in developing countries*. Second edition. Aldershot, England and Brookfield, Vt.: Gower in association with the London School of Economics and Political Science, [1975] 1987. Pp. xvii, 185. \$41.50. ISBN 0-566-05465-5. JEL 87-1115

Second edition focuses on the legal framework of foreign investment. This edition has been updated and includes a new introduction. Discusses: incentives to invest in developing countries; the

legal value of state undertakings; conflicts of interest between territorial sovereignty and safety of investment; international law relating to nationalization; international settlement of investment disputes; investment guarantee schemes and insurance against nationalization risks; and the trend toward joint ventures. De Lupis is a lawyer and conducts a course on the international legal order at the London School of Economics and Political Science. Index.

ENGBERG-PEDERSEN, POUL. *World Bank management of structural crises in Africa. The energy sector*. CDR Research Report series, no. 9. Copenhagen: Centre for Development Research, 1986. Pp. 149. Paper. ISBN 87-88467-30-9.

JEL 87-1116

Examines whether the States of Sub-Saharan Africa (SSA) and Western donor agencies that provide most of official development finance on the subcontinent have acknowledged the extent of structural crisis in SSA development and are changing their policies and programs accordingly. Uses the World Bank as a case study for donor strategies and the energy sector as a case study of the awareness of structural crisis found in present government and donor policies and programs. The bulk of the report analyzes the global energy crises and the effects of current energy policies and programs on structural adjustment in Africa and presents alternative energy policies for structural adjustment in Sub-Saharan Africa. The study also assesses contradictions in the World Bank approach and with World Bank energy assistance. Concludes that for the World Bank to fulfill a role of guarantor of national economic development in low-income countries it must overcome: (1) the dilemmas of dependence on state apparatuses to implement structural adjustments that include a change and reduction in state intervention and (2) reliance on a series of development projects to achieve macroeconomic growth and structural change. The author is Researcher, Centre for Development Research, Copenhagen, Denmark. No index.

GLICK, REUVEN. *Economic perspectives on foreign borrowing and debt repudiation: An analytic literature review*. Monograph Series in Finance and Economics, Monograph 1986-4. New York: New York University, Graduate School of Business Administration, Salomon Brothers Center for the Study of Financial Institutions, 1987. Pp. 82. \$7.00, paper.

JEL 87-1117

Analytical survey of the literature regarding the debt situation of developing countries. Presents the historical background to the current state of indebtedness and reviews models of the dynamic

relationship between debt and growth. Evaluates models of optimal debt with repayment and those that explicitly account for resource limitations and credit constraints. Examines models that consider the possibility of debt repudiation and estimate its costs. Discusses models that consider the impact of asymmetries of information between lenders and borrowers on the possibility of debt repudiation and describes models that focus on liquidity problems and rescheduling. Highlights the role of expectation, information, and international organizations. Glick is an economist in the Research Department of the Federal Reserve Bank of San Francisco. No index.

MOSLEY, PAUL. *Foreign aid: Its defense and reform*. Lexington, Ky.: University Press of Kentucky, 1987. Pp. xiv, 284. \$25.00. ISBN 0-8131-1608-2.

JEL 87-1118

An analysis of the pattern of allocation and effect of foreign aid. Reviews the theoretical case for overseas aid as a public good. Examines the international politics of aid and the nature of community and conflict among aid donors. Presents a formal model of the determination of bilateral aid disbursements and discusses the allocation of aid in recipient countries. Reviews the evidence for the effectiveness of aid as an instrument of development, a redistributive tool, and as an export subsidy. Concludes that aid has been unsuccessful as an instrument of political leverage and export promotion. Argues that the case for aid rests on the increase in growth rates of some recipient countries and the improvement of living standards of some poor people. Mosley is Professor of Development Economics and Policy at the University of Manchester. Bibliography; index.

MOWERY, DAVID C. *Alliance politics and economics: Multinational joint ventures in commercial aircraft*. Competing in a Changing World Economy Project series. Washington, D.C.: American Enterprise Institute for Public Policy Research; Cambridge, Mass.: Harper and Row, Ballinger, 1987. Pp. xi, 194. ISBN 0-88730-213-0.

JEL 87-1119

Analyzes the causes and consequences of international joint ventures in the commercial aircraft industry, focusing on ventures involving U.S. aircraft and engine producers and foreign enterprises. Discusses the motives for participation by U.S. firms, managerial and organizational factors that affect the success or failure of projects, and consequences for the structure and competitiveness of the industry. Describes the general characteristics of international joint ventures and considers implications of interfirm cooperation. Surveys recent

developments in the competitive and technological environment of the U.S. aircraft industry and examines several joint ventures, including the Boeing 767 and 7J7, CFM56 and V2500 engines, the McDonnell Douglas Mercure 200 project, the General Electric SNECMA, and the Saab-Fairchild 340 commuter aircraft. Considers the approach of foreign firms and governments to joint ventures with studies of industries in Japan, Brazil, and Sweden. Considers the complications of joint ventures for U.S. policy makers and corporate managers. Mowery is Associate Professor of Economics and Social Sciences, Carnegie-Mellon University. Bibliography; index.

NEMETZ, PETER N., ed. *The Pacific Rim: Investment, development and trade*. Vancouver: University of British Columbia Press, 1986. Pp. ix, 319. \$19.95, paper. ISBN 0-7748-0266-8. JEL 87-1120

Ten papers and an introduction by the editor examine the past pattern and future prognosis of trade, investment, and development of Pacific Rim countries and the critical role of energy supply and demand in their development and interdependence with other global regions. Also issued as the *Journal of Business Administration*, volume 16, numbers 1-2. Specific topics include: the pattern of Japan's investment and trade with other nations; ASEAN in Pacific Basin trade; investment, growth, and employment in Thailand; Chinese overseas investment in the Pacific Rim; the role of Pacific ocean minerals; comparison of post-1973 changes in the energy systems of Japan and China; the role played by governments in the development and trade of petroleum resources in the Pacific Rim; factors affecting steam coal trade in Asia and the Pacific; the British Columbia coal industry and Pacific Rim trade and investment; and Canada's role in Pacific Rim integration. Contributors are mainly economists and resource specialists. Nemetz is Associate Professor and Chairman of the Policy Analysis Division in the Faculty of Commerce at the University of British Columbia and Editor of the *Journal of Business Administration*. No index.

### 500 Administration; Business Finance; Marketing; Accounting

ROBISON, LINDON J. AND BARRY, PETER J. *The competitive firm's response to risk*. New York: Macmil-

lan; London: Collier Macmillan, 1987. Pp. xii, 324. \$37.50. ISBN 0-02-948640-8. JEL 87-1121

This textbook and reference for advanced undergraduate and graduate students extends microeconomic theory to assess the effects of risk on the equilibrium conditions for a competitive firm. Part 1 is an introduction to decision making under risk and covers the nature of risk, ordering individuals' attitudes toward risk, and ordering risky choices. Part 2 deals with organizing firm-level research under risk and includes firm-level models and equilibrium analysis under risk. Part 3 analyzes firm response to risk, and covers optimal output under price uncertainty and risk-reducing inputs, optimal input use, hedging, diversification, share leasing, and the use of information as risk responses. Part 4 covers transformed distributions and response to risk, and includes indirect and direct outcome variables and insurance, managing financial structure, flexible durables, participation in public programs, and new technology as response to risk. Robison is with Michigan State University. Barry is with the University of Illinois, Urbana-Champaign. Author and subject indexes.

### 510 ADMINISTRATION

DOUGLAS, EVAN J. *Managerial economics: Analysis and strategy*. Third edition. Englewood Cliffs, N.J.: Prentice-Hall, [1979, 1983] 1987. Pp. xxiv, 648. ISBN 0-13-550630-0. JEL 87-1122

Managerial economics textbook designed for a one-term course at the undergraduate or MBA level. Changes to the current edition include a reorganization of chapters dealing with pricing analysis and decisions, and the inclusion of a chapter on product quality and competitive strategy. Additional new material incorporated throughout the text considers: daily interest discount factors; the principal-agent problem and the issue of incentive contracts; the learning curve in the context of changing input productivity as cumulative output grows; contestable markets and barriers to entry; and cost-plus-fee and incentive bidding. Six new appendices at the end of relevant chapters contain some of the more complicated microeconomic theory materials formerly in the basic text and discuss: indifference curve analysis, demand forecasting, isoquant-isocost analysis of production problems, linear programming, models of a firm's pricing decisions, and illegal pricing decisions under antitrust laws. Learning and teaching aids include: case study problems, recent examples, a study guide/workbook, and a computer courseware package and manual. Douglas is a member of the Department of Economics at Bentley College, Massachusetts. Author and subject indexes.

FOX, KARL A. AND MILES, DON G., eds. *Systems economics: Concepts, models, and multidisciplinary perspectives*. Ames: Iowa State University Press, 1987. Pp. xvii, 252. \$24.50. ISBN 0-8138-1738-2.

JEL 87-1123

Nine papers discuss the applications of a systems approach to problems in economics and agricultural economics. Part 1 covers general issues and includes papers on: the economy as an ecosystem; general equilibrium and general systems theory; systems theory in mathematical economics; and the concept of variety in systems behavior. Part 2 is devoted to applications and covers: holistic modeling; systems management, repair, and improvement; behavior settings, time-allocation matrices, and social system accounts; models of social income; and community dynamics. Two appendices discuss holistic and problem shifting analyses and systems economics, and provide classic examples of systems thinking in several sciences. The contributors are Kenneth E. Boulding, Roy J. Gardner, Glenn L. Johnson, Michael S. Lawlor, James R. Prescott, Jati K. Sengupta, Paul van Moeseke, and the editors. Fox is Professor of Economics at Iowa State University. Miles is Lecturer in Agricultural Economics at the Muresk Institute of Agriculture, Western Australian Institute of Technology. Name and subject indexes.

GRAYSON, LESLIE E. *Who and how in planning for large companies: Generalizations from the experiences of oil companies*. New York: St. Martin's Press, 1987. Pp. viii, 241. \$37.50. ISBN 0-312-87005-1.

JEL 87-1124

Describes and analyzes the planning processes of five major oil companies—Royal Dutch/Shell Group, Chevron, Conoco, Compagnie Française des Pétroles, and Sohio. Discusses long-range strategic planning and scenario planning. Examines oil company planners and the planning process. Provides a detailed analysis of planning in each of the five oil companies. Notes differences among the firms according to nationality, multi-national or national states, size, and type of ownership. Grayson is Professor of International and Business Economics at the Colgate-Darden Graduate School of Business Administration, University of Virginia. Index.

DE KOK, A. G. *Production-inventory control models: Approximations and algorithms*. CWI Tracts series, no. 30. Amsterdam: Centre for Mathematics and Computer Science, 1987. Pp. iii, 214. Dfl 33.00, paper. ISBN 90-6196-310-0.

JEL 87-1125

Probabilistic analysis of several one-product production-inventory models which were designed to

model coordination of the production rate with inventory levels in order to cope with random fluctuations in demand. Focuses on models with a compound Poisson demand process and two possible production rates, and concentrates on service measures rather than on costs. Examines: the basic model with backordering of excess demand; the lost-sales model; the single product production-inventory model with mixed backlogging and partial lost sales; the single product production-inventory model in which excess demand is either backlogged or completely lost; approximations for the average holding and switching costs; a production-inventory model with positive setup time; and a dam problem with variable release rate. Index.

[MARSCHAK, JACOB.] *Decision and organization: A volume in honor of Jacob Marschak*. Second edition. Edited by C. B. McGuire and Roy Radner. Minneapolis: University of Minnesota Press, [1972] 1986. Pp. xxiv, 373. \$15.95, paper. ISBN 0-8166-1365-6.

JEL 87-1126

Second edition of the essays in this *Festschrift* for Jacob Marschak includes an account of Marschak's career and work, as well as the addition of new references to many of the essays to indicate current literature on the topics. [See JEL no. 73-0192 for annotation of the first edition.] Includes a new biographical essay by Kenneth Arrow and an updated listing of Marschak's works. McGuire is Professor of Public Policy at the University of California, Berkeley. Radner is Research Professor of Economics at New York University and a member of the staff at AT&T Bell Laboratories. Name and subject indexes.

PEPPERS, LARRY C. AND BAILS, DALE G. *Managerial economics: Theory and applications for decision making*. Englewood Cliffs, N.J.: Prentice-Hall, 1987. Pp. xxii, 679. ISBN 0-13-550055-0.

JEL 87-1127

Textbook in managerial economics covering economic theory and its application to business operations. Topics include: the economic roots of business operations; value creation by the firm; optimization techniques; demand analysis and consumer behavior; elasticity of demand; regression analysis and empirical estimation; demand analysis in marketing and sales; the production process; cost theory and measurement; estimation of cost and production functions; risk and uncertainty; capital budgeting; theory of the firm and market structure; models of imperfect competition; profits and profitability analysis; pricing decisions; and wealth creation and distribution in government and business. Each chapter contains a summary and questions. Peppers is at Washington and Lee Uni-

versity. Bails is at Memphis State University. Index.

- RAMSEY, JACKSON E. *Research and development: Project selection criteria*. Revised edition. Research for Business Decisions series, no. 80. Ann Arbor, Mich.: University Microfilms, UMI Research Press, [1978] 1986. Pp. 215. ISBN 0-8357-1708-9. JEL 87-1128

Explores the research and development to operations planning processes. Reviews and analyzes problems in present management approaches, intralevel objective and strategy interaction, and new product projects. Introduces and discusses the process of choice and interrelation among normative frameworks. Outlines the normative frameworks for intralevel objective and strategy interaction as well as for applied new product development project selection. Discusses the uses of normative frameworks to overcome identified failure causes. Bibliography; index.

- SAWARAGI, Y.; INOUE, K. AND NAKAYAMA, H., eds. *Toward interactive and intelligent decision support systems*. Volume 1. *Proceedings of the Seventh International Conference on Multiple Criteria Decision Making, held at Kyoto, Japan, August 18-22, 1986*. Lecture Notes in Economics and Mathematical Systems series, no. 285. New York; Berlin; London and Tokyo: Springer, 1987. Pp. xii, 445. \$45.60, paper. ISBN 0-387-17718-3. JEL 87-1129

Forty-five papers presented at an international conference on multiple criteria decision making. Part 1 focuses on interactive decision support systems. Part 2 deals with interactive multiobjective programming methods. Part 3 consists of applications in the field of planning, design, and production. Part 4 deals with the theory of vector optimization. Contributors include several economists. Sawaragi is associated with the Japan Institute of Systems Research, Kyoto. Inoue is Professor, Department of Aeronautical Engineering, Kyoto University. Nakayama is Professor, Department of Applied Mathematics, Konan University, Kobe, Japan. No index.

- SAWARAGI, Y.; INOUE, K. AND NAKAYAMA, H., eds. *Toward interactive and intelligent decision support systems*. Volume 2. *Proceedings of the Seventh International Conference on Multiple Criteria Decision Making, held at Kyoto, Japan, August 18-22, 1986*. Lecture Notes in Economics and Mathematical Systems series, no. 286. New York; Berlin; London and Tokyo: Springer, 1987. Pp. xii, 450. \$45.60, paper. ISBN 0-387-17719-1. JEL 87-1130

Forty-five papers presented at an international conference on multiple criteria decision making. Part 1 focuses on intelligent decision support systems. Part 2 deals with utility and risk analysis whereas part 3 examines value analysis and intensity of preference. Part 4 is devoted to hierarchy analysis and weighting methods. Part 5 considers incomplete information, and part 6 analyzes group decisions. Contributors include several economists. Sawaragi is Professor at the Japan Institute of Systems Research, Kyoto. Inoue is a member of the Department of Aeronautical Engineering, Kyoto University. Nakayama is a member of the Department of Applied Mathematics, Konan University, Kobe, Japan. No index.

## 520 BUSINESS FINANCE AND INVESTMENT

- CLARK, RODNEY. *Venture capital in Britain, America and Japan*. New York: St. Martin's Press, 1987. Pp. 110. \$35.00. ISBN 0-312-00505-9. JEL 87-1131

Describes American venture capital and explains how it has been adopted in Japan and Britain. Notes that a distinctive feature of American venture activity is that it represents a successful attempt to institutionalize entrepreneurship, especially entrepreneurship associated with technical innovation. Describes conditions necessary for successful venture capitalism. Attributes changes in tax laws and the administration of pension funds with generating a large flow of venture capital funds in the United States during the late 1970s, and finds that other countries were attracted by the U.S. success and were also disenchanted with government intervention. Examines the growth of venture capital in Japan and the United Kingdom, focusing on the obstacles to the adoption of a U.S.-style system. Concludes that the American system of venture capital can be transplanted successfully and that venture capital is becoming more institutionalized in the United States and less institutionalized in Japan and the United Kingdom. Clark is with the Technical Change Centre. Index.

- FOX, MERRITT B. *Finance and industrial performance in a dynamic economy: Theory, practice, and policy*. Columbia Studies in Business, Government, and Society series. New York: Columbia University Press, 1987. Pp. x, 455. \$45.00. ISBN 0-231-06282-6. JEL 87-1132

Analysis of the institutions associated with the allocation and control of capital and their influence on industrial performance. Reviews the nature of the information available to decision makers in-

volved in the finance process and outlines an information based theory of the role of finance in industrial performance. Presents a study of the financing of the semiconductor industry, assessing the influence of finance on dynamic efficiency and competition in the industry, and examines the applications of this study to the formulation and implementation of policy. Fox is Professor of Law and Ira C. Bateman Faculty Fellow at the Indiana University School of Law, Bloomington. Author and subject indexes.

SCHALL, LAWRENCE D.; HALEY, CHARLES W. AND SCHACHTER, BARRY. *Introduction to financial management*. Second Canadian edition. Toronto; New York; Auckland and London: McGraw-Hill, Ryerson, [1981] 1987. Pp. xvii, 726. \$42.95. ISBN 0-07-549156-7. JEL 87-1133

Revised updated edition of an introductory finance textbook designed for courses ranging from an undergraduate one-semester course to an introductory MBA course. Assumes minimal background in mathematics and economics but at least one quarter of accounting. In addition to general updating and simplification, major changes to this edition include: the discussion of recent federal law changes; a complete revision of the material on security prices, and risk and return; revision of the material on capital budgeting and the discussion of formal methods of adjusting for risk; and an expanded treatment of cash-management methods and letters of credit. A study guide and instructor's manual are also available. Schall is Professor of Finance and Business Economics, University of Washington. Haley is Rainier National Bank Professor of Banking and Finance, University of Washington. Schachter is Assistant Professor, Faculty of Business Administration and Department of Economics, Simon Fraser University. Glossary; index.

#### 540 ACCOUNTING

GEORGES, WALTER AND MCGEE, ROBERT W. *Analytical contribution accounting: The interface of cost accounting and pricing policy*. New York and London: Greenwood Press, Quorum Books, 1987. Pp. xii, 254. \$39.95. ISBN 0-89930-209-2. JEL 87-1134

Analysis of the relationship between cost accounting and the pricing policy of enterprises. Part 1 considers some general aspects of pricing policy including its objectives, determinants, behavior, and strategy. Part 2 examines cost as a determinant of price and discusses: the relationship between cost accounting and pricing policy; cost concepts

relevant to pricing policy; and the role cost of accounting information in determining price floors, price differentiation, price changing, and the pricing of individualized products. Part 3 reviews cost-oriented methods of price determination, including decisions based on full and partial costing. Part 4 presents the methodology, fundamental principles, and motives for the choice of analytical contribution accounting and discusses pricing policy-oriented calculation models. Georges is Lecturer in Accounting at the Institute for Business Management, Ghent. McGee is Associate Professor of Accounting at Seton Hall University, New Jersey. Bibliography; index.

HOLZER, H. PETER AND SCHOENFELD, HANNES-MARTIN W., eds. *Managerial accounting and analysis in multinational enterprises*. New York and Berlin: de Gruyter, 1986. Pp. xii, 270. ISBN 0-89925-087-4. JEL 87-1135

Proceedings of a colloquium on managerial accounting and analysis in multinational enterprises sponsored by the Center for International Education and Research in Accounting of the University of Illinois at Urbana-Champaign. Eight papers outline the accounting and performance evaluation techniques employed for the evaluation of international subsidiaries by: IBM; the Monsanto company; GoldStar Electronics; the FMC Corporation; Borg-Warner; Nixdorf and Philips; Alldelphi Germany; and Nixdorf Computer AG Paderborn. Four papers examine the view of independent accountants on: the impacts of performance evaluation techniques on managerial incentives and strategic planning; problems of operating in an international environment; evaluation in the case of acquisition or disposal and annual audits; and the present state of performance evaluation in multinational companies. The contributors are mainly accountants. Holzer is the Deloitte Haskins and Sills Professor of Accountancy and Schoenfeld is the H. T. Scovill Professor of Accountancy and Business Administration, both at the University of Illinois at Urbana-Champaign. Bibliography; index.

#### 600 Industrial Organization; Technological Change; Industry Studies

##### 610 INDUSTRIAL ORGANIZATION AND PUBLIC POLICY

BAILEY, ELIZABETH E., ed. *Public regulation: New perspectives on institutions and policies*. MIT Press Series on the Regulation of Economic Activity, no. 14. Cambridge, Mass. and London: MIT Press, 1987. Pp. xiv, 404. \$42.50. ISBN 0-262-02258-3. JEL 87-1136

Eleven essays, presented at a conference on public regulation sponsored by Carnegie-Mellon University in 1985, emphasize an interdisciplinary approach to the nature of research on issues of public regulation. Contributions discuss the design and formulation of regulatory policy and the assessment of regulatory performance. Specific topics include: information and regulation; a judicial review of questions of law and policy; modern political economy and the study of regulation; the regulatory surge of the 1970s in historical perspective; a general equilibrium analysis of natural gas price regulation; risk analysis and relevance of uncertainty in nuclear safety decisions; experimental evaluation of the contestable markets hypothesis; agricultural marketing boards and induced voting behavior; an assessment of the efficiency effects of U.S. airline deregulation; occupational disease remedies and the asbestos experience; and a laboratory analysis of industrywide regulation and the formation of reputations. Bailey is Dean of the Graduate School of Industrial Administration, Carnegie-Mellon University. Index.

BARNEY, JAY B. AND OUCHI, WILLIAM G., eds. *Organizational economics*. Jossey-Bass Management Series. Jossey-Bass Social and Behavioral Science Series. San Francisco and London: Jossey-Bass, 1986. Pp. xix, 495. ISBN 1-55542-015-X.

JEL 87-1137

Fifteen previously published essays, with an introduction by the editors, discuss organizations and organizational phenomena using concepts from organizational theory and behavior and microeconomics. Essays are presented in six chapters, each with an introduction, covering: basic concepts underlying the economics of organization such as information, opportunism, economic exchange, and the competitive contracting process; theories of market failures, including transactions-cost economics; the impact of markets on firms; agency theory; managerial theory of the firm; and the economics of business strategy. Barney is Assistant Professor of Management at Texas A&M University; Ouchi is Professor of Management in the Graduate School of Management at the University of California, Los Angeles. Name and subject indexes.

CAVES, RICHARD. *American industry: Structure, conduct, performance*. Sixth edition. Foundations of Modern Economics Series. Englewood Cliffs, N.J.: Prentice-Hall, [1964 . . . 1982] 1987. Pp. x, 124. Paper. ISBN 0-13-027665-0. JEL 87-1138

Sixth edition of this introductory level textbook on industrial organization. [See JEL no. 82-1185 for annotation of fifth edition.] Examines: the busi-

ness sector and its organization; elements of market structure; the large corporation; market conduct; market performance; antitrust laws; and public policy. Changes to the current edition place a substantial emphasis on "committed competition" and reflect the weakening of antitrust policy that has occurred over the past decade. Caves is Professor of Economics at Harvard University. Index.

COHEN, STEPHEN S. AND ZYSMAN, JOHN. *Manufacturing matters: The myth of the post-industrial economy*. Council on Foreign Relations Book series. New York: Basic Books, 1987. Pp. xiv, 297. \$19.95. ISBN 0-465-04384-4. JEL 87-1139

Examines the role of manufacturing in the current economy. Part one illustrates why manufacturing matters, and examines: linkages, wealth, and power; services and the American trade balance; services and development; and the eroding competitiveness of American industry. Part 2 discusses the management of the transition, focusing on: market competition, technological development, and trade; production skills; manufacturing flexibility; the manufacturing and telecommunications revolutions; and choices America faces. Part 3 focuses on creating advantage, and discusses policy and competitiveness in a changing world and trade policy in an evolving world economy. Concludes that the United States is not experiencing a transition from industry to service, but rather from one kind of industrial society to another, and that the choices we make as a nation will determine whether the United States continues its role of industrial leadership. Cohen and Zysman are Professors at the University of California, Berkeley. Index.

CREW, MICHAEL A., ed. *Regulating utilities in an era of deregulation*. New York: St. Martin's Press, 1987. Pp. xii, 201. \$35.00. ISBN 0-312-00527-X. JEL 87-1140

Eleven essays, resulting from two seminars held at Rutgers University in November 1985 and May 1986, examine the regulation of traditional utilities in an era of deregulation. Topics include: productivity incentives and rate-of-return regulation; regulatory policy under uncertainty; governance costs of regulation for water supply; Ramsey pricing in telecommunications markets with free entry; and analysis of pricing and production efficiency of electric utilities by mode of ownership; residential electricity demand modeling with secret data; and estimation and linking of economic and financial costs in telecommunications. Contributors are mainly economists. Crew is Professor of Economics at the Graduate School of Management, Rutgers University. Index.

- GOEHLENT, ROBERT AND GUNDERSON, NELS. *Government regulation of business: An information sourcebook*. Oryx Sourcebook Series in Business and Management. Phoenix, Ariz.: Oryx Press, 1987. Pp. ix, 425. \$55.00. ISBN 0-89774-261-3.

JEL 87-1141

Bibliography designed to assist librarians, researchers, government personnel, and business people interested in government regulation of business. Though most of the focus is on regulation at the national level, some materials are included dealing with regional, state, and local levels. Citations are drawn from a variety of fields, including business, economics, political science, law, history, public administration, and general social sciences. Includes books, articles, dissertations, essays, research reports, and selected documents, which are analytical and scholarly in nature. Time period is primarily 1945-85 with some earlier citations. Divided into six sections: core library collection, economics of regulation, politics of regulation, regulatory activities, major regulatory agencies, and reference works. Author, title, and subject indexes.

- JANSSON, J. O. AND SHNEERSON, D. *Liner shipping economics*. London and New York: Chapman and Hall, 1987. Pp. x, 299. \$65.00. ISBN 0-412-26310-6.

JEL 87-1142

Presents a comprehensive description of the liner shipping industry and develops analytical methods for service optimization. The general principles derived are illustrated by case studies and practical examples to convey a sense of the reality of seaborne freight transport and to demonstrate the theoretical underpinnings of empirical studies of liner shipping operations. Discusses characteristics of the demand and supply of liner shipping, the conference system of market organization, the level and structure of freight rates, and the art of charging what the traffic can bear. Examines the optimization of liner service, focusing on: ship size and shipping costs, multi-port calling versus trans-shipment, shippers' cost of sailings infrequency and transit time, port costs and charges and the problem of shipping and port suboptimizations, and a cost minimization model of liner trade. Provides an economic evaluation of the conference system and concludes that price competition in liner shipping should be encouraged. Jansson is with the Swedish Road and Traffic Institute, Linköping. Shneerson is with the Department of Economics at the University of Haifa. Author and subject indexes.

- DE JONG, H. W. AND SHEPHERD, W. G., eds. *Mainstreams in industrial organization*. Book I. *Theory*

and international aspects. Studies in Industrial Organization series, vol. 6. Hingham, Mass., Dordrecht and Lancaster: Kluwer Academic, 1986. Pp. x, 210. ISBN 90-247-3461-4.

JEL 87-1143

The first of two books of a volume containing the essays and selected discussions presented at the conference on Mainstreams in Industrial Organization, held at the University of Amsterdam, in August 1985. This book contains eight essays, which examine the theory and international aspects of mainstream industrial organization. Frederic Scherer discusses the current state of knowledge in industrial organization. William Shepherd reviews the core concepts of industrial economics and Henk de Jong examines European industrial organization. Chris Green discusses the challenges and tasks of mainstream industrial economics, and Ann Hendriks reviews the current themes in the discipline. Gunnar Eliasson examines international competition, productivity change, and the organization of production. Takgo Nakao discusses industrial organization in an international framework and Richard Caves presents evidence from the United States on exporting behavior and market structure. De Jong is Professor of Economics at the University of Amsterdam. Shepherd is Professor of Economics at the University of Michigan. No index.

- DE JONG, H. W. AND SHEPHERD, W. G., eds. *Mainstreams in industrial organization*. Book II. *Policies: Antitrust, deregulation and industrial*. Studies in Industrial Organization series, vol. 6. Hingham, Mass., Dordrecht and Lancaster: Kluwer Academic, 1986. Pp. x, 215 - 465. ISBN 90-247-3462-2.

JEL 87-1144

The second of two books of a volume containing essays and selected discussions presented at the Conference on Mainstreams in Industrial Organization, held at the University of Amsterdam in August 1985. Contains nine essays on antitrust policy, deregulation, and industrial policy. Essays examine: U.S. antitrust policy at the crossroads; the treatment of dominant firms in U.K. competition legislation; the treatment of dominance in German antitrust policy; competition policies and measures of dominant power; lessons of economics for antitrust; the effects of U.S. transport deregulation; deregulation of European air transport; industrial policy in theory and reality; public support of innovative activity; and industrial policy and innovation in Europe. Contributors are mainly economists. De Jong is Professor of Economics at the University of Amsterdam. Shepherd is Professor of Economics at the University of Michigan. No index.

- MONOPOLKOMMISSION. *German Monopolies Commission 1973-1983: Summaries of the first five Biennial*

*Reports.* Monopolkommission Auflage, no. 1. Baden-Baden: Nomos, 1987. Pp. 175. Paper. ISBN 3-7890-1348-X. JEL 87-1145

English summaries of the first five Biennial Reports (1973-75, 1976-77, 1978-79, 1980-81, and 1982-83) of the Monopolies Commission, assessing the current level of business concentration and its foreseeable development in light of economic policy. Each report contains common items, such as the extent of concentration and trends in manufacturing industries, large companies, and the merger control. No index.

MOSLER, K. C. *Continuous location of transportation networks.* Texts and Monographs in Economics and Mathematical Systems series. New York; Berlin; London and Tokyo: Springer, 1987. Pp. x, 158. \$32.00. ISBN 0-387-17297-1. JEL 87-1146

Revised version of an earlier monograph titled *Optimale Transportnetze; Zur Bestimmung ihres Kostengünstigsten Standorts bei gegebener Nachfrage* (1976). Concerned with the problem of constructing an optimal geometric location of transport lines and junctions in continuous two-space as opposed to the discrete approach. Presents a general framework for the continuous location of networks. Shows that many practical features can be incorporated in the framework and solves the network optimization problem in certain special cases. Introduces optimal transportation networks, costs on the network, and urban transportation planning. Examines transport lines and isovectors, cost surfaces, laws of refraction, a circular area with radially symmetric transfer cost, and anisotropic transport. Exhibits the continuous network location problem in detail and considers isotropic and anisotropic transport to a center. Concludes with an examination of regular networks covering the plane. Mosler is at the Institut für Statistik und Quantitative Ökonomik, Universität der Bundeswehr Hamburg. Bibliography; author and subject indexes.

MUELLER, WILLARD F.; HELMBERGER, PETER G. AND PATERSON, THOMAS W. *The Sunkist case: A study in legal-economic analysis.* Lexington, Mass. and Toronto: Heath, Lexington, 1987. Pp. xiv, 271. \$34.95. ISBN 0-669-15189-0. JEL 87-1147

A legal-economic analysis of the application of the antitrust laws to agricultural cooperatives that focuses on the antitrust case brought by the Federal Trade Commission charging Sunkist Growers, Inc. with monopolizing the California-Arizona citrus industry. Describes the main issues in the FTC case and identifies the legal rules that are to be used in analyzing these issues. Discusses the analytical framework used to develop hypotheses concerning violations, and proceeds to test these hy-

potheses by examining the structure, conduct, and performance of the industry, focusing on the role of Sunkist. Summarizes the significance of the findings for determining whether Sunkist violated the antitrust laws and whether the relief ordered by the FTC was appropriate. Mueller is William F. Vilas Research Professor of Agricultural Economics at the University of Wisconsin, Madison. Helmburger is Professor of Agricultural Economics at the University of Wisconsin, Madison. Paterson is an attorney with Susman, Godfrey and McGowan in Houston. References; index.

PARZYCH, KENNETH M. *A primer to antitrust law and regulatory policy.* Lanham, Md. and London: University Press of America, 1987. Pp. x, 112. \$19.50, cloth; \$7.75, paper. ISBN 0-8191-5786-4, pbk. JEL 87-1148

Provides a basic and concise introduction to U.S. antitrust policy. Emphasis is placed on a selected number of judicial proceedings. Begins with an introduction and analysis of market structures, covering the evolution of the market system, classical and oligopoly markets, the doctrine of conscious parallelism, and the wastes of monopolistic competition. Reviews the causes and effects of economic concentration. Presents the highlights of the basic antitrust laws and reviews the leading cases that have interpreted them. Examines statutes and policies that impede competition. Discusses mergers and acquisitions, and the antitrust laws and international commerce. Concludes with an evaluation of regulatory policy, including its weaknesses and proposed reforms. Parzych is Professor of Economics at Eastern Connecticut State University. Index.

REICH, ROBERT B. AND DONAHUE, JOHN D. *New deals: The Chrysler revival and the American system.* Paperback reprint. New York; Middlesex, England; Victoria, Australia and Markham, Ontario: Penguin Books, [1985] 1986. Pp. 359. Paper. ISBN 0-14-006983-7. JEL 87-1149

Describes the precedents and the content that shaped the Chrysler rescue, summarizing the Chrysler story from the 1920s to the troubles of the 1970s. Explores what happened after the Loan Guarantee Act was passed and appraises the role of managers, workers, lenders, dealers, suppliers, public officials, lawyers, and investment bankers in the Chrysler struggle. Recounts the company's return to profitability and the politics of recovery. Considers the implications for the role of the public in saving an element of the private sector. Reich is with the John F. Kennedy School of Government, Harvard University. Donahue is a doctoral fellow at the Center for Business and Government, Harvard University. Index.

ROBYN, DOROTHY. *Braking the special interests: Trucking deregulation and the politics of policy reform*. Chicago and London: University of Chicago Press, 1987. Pp. xii, 295. \$24.95. ISBN 0-226-72328-3. JEL 87-1150

Presents observations on the trucking contest that existed between December 1979, when President Carter placed motor carrier deregulation on his reform short list, and July 1980, when the Motor Carrier Act became law. In addition to formal hearings and floor votes, empirical data were drawn from informal conversations and meetings of the ad hoc coalition supporting reform. Identifies four elements important in deregulatory success: strategic use of economic evidence and policy analysis to demonstrate the merits of deregulation; organization of a diverse coalition of firms and interest groups lobbying for reform; use of transition strategy to soften opposition to reform; and strategic bargaining by the president with Congress. Draws on political and economic theory and offers insights relevant to battles in other areas such as agriculture, tax policies, and trade. Robyn is Assistant Professor of Public Policy, Kennedy School of Government, Harvard University. Index.

SAMUELS, WARREN J. AND MILLER, ARTHUR S., eds. *Corporations and society: Power and responsibility*. Contributions in American Studies series, no. 88. New York and London: Greenwood Press, 1987. Pp. xv, 328. \$45.00. ISBN 0-313-25072-3. JEL 87-1151

Twelve contributions review and assess the implications of the 1886 Supreme Court ruling in the *Santa Clara* case, which held that a corporation is a person within the meaning of the Constitution, thereby receiving constitutional protection. Part 1 focuses on the doctrinal origins of the personhood conception, and discusses: the development of corporate theory; the Sherman Antitrust Act and the corporate reconstruction of American capitalism, 1890-1914; and a political analysis of neoclassical institutionalist perspectives on the modern corporation. Part 2 examines the role of legal language as social control and economic planning, and reviews: the idea of a corporation as a person and the normative significance of judicial language; the jurisprudence of corporate personhood and the misuse of a legal concept; and the paradox of paternalism and laissez-faire constitutionalism. Part 3 discusses double standards in antitrust law policy, and bigness and social efficiency in the U.S. auto industry. Part 4 examines the corporation as private government, focusing on: the corporations and the two constitutions; competitiveness diversity in a market-concentrated economy; moral and criminal responsibility and corporate persons; and profit

sharing and employee stock ownership plans. Contributors are mainly economists and lawyers. Samuels is Professor of Economics at Michigan State University. Miller is Professor Emeritus of Constitutional Law at George Washington University. Selected bibliography; index.

TISMER, JOHANNES F.; AMBLER, JOHN AND SYMONS, LESLIE, eds. *Transport and economic development—Soviet Union and Eastern Europe*. Osteuropa-Institut an der Freien Universität Berlin, Wirtschaftswissenschaftliche Veröffentlichungen, band 42. Berlin: Duncker and Humblot, 1987. Pp. xxiv, 474. DM 48.00, paper. ISBN 3-428-06199-3. JEL 87-1152

Sixteen papers resulting from an international conference on transport as a problem in the economic development of the Soviet Union and the communist countries of Eastern Europe, held in Berlin in May 1985. The papers concentrate on analyzing the relations between the transport sector as a system, its branches or its service areas, and the economy at sectoral and regional levels. Eight papers are specific to the Soviet Union; their topics include: the effects of sectoral transport demands on the transport system; factors controlling recent performance on railways; the current campaign to increase freight train weight; the extent to which inland waterways transport can provide relief for the railways; maritime transport in an overcrowded market; problems and possibilities in connection with shipping in the Central Arctic Basin; consumption of automotive oil products in road transport; and transport and the pattern of settlement in Soviet Caucasasia. The other papers consider: current developments in transport and traffic between the U.S.S.R. and Eastern Europe; the effect of transport bottlenecks on production; transport and the pattern of settlement in Poland; investment policy in the Polish transport sector; Albania's transport relations with its neighbors; the impact of the Danube-Black Sea Canal; and the rise and fall of Soviet influence on the Chinese aircraft industry and air transport. Index.

TYE, WILLIAM B. *Encouraging cooperation among competitors: The case of motor carrier deregulation and collective ratemaking*. New York and London: Greenwood Press, Quorum Books, 1987. Pp. xix, 202. ISBN 0-80930-246-7. JEL 87-1153

Examines the effects of the Motor Carrier Act of 1980 on competition in the trucking industry. Presents an overview of the issues raised by collective ratemaking in the motor carrier industry. Discusses the dilemma of encouraging cooperation among horizontally and vertically related rivals and examines cooperation among rivals. Concludes that

there is no evidence supporting the contention that rate bureaus act as government-enforced cartels. Further, a system of competition, collective rate making, and residual regulation offers a sound basis for resolving the tension between coordination and competition. Tye is a member of Putnam, Hayes, and Bartlett, Inc., an economic and management consulting firm specializing in antitrust law and regulation. Bibliography; index.

WILLS, ROBERT L.; CASWELL, JULIE A. AND CULBERTSON, JOHN D., eds. *Issues after a century of federal competition policy*. Lexington, Mass. and Toronto: Heath, Lexington Books, 1987. Pp. vii, 387. ISBN 0-669-13320-5. JEL 87-1154

Twenty-one essays, one previously published, plus additional statements and comments dedicated to Willard F. Mueller on his retirement from full-time professorship in the Department of Agricultural Economics at the University of Wisconsin, Madison. Part 1 is an introduction and tribute, and contains personal statements and Mueller's address to the American Agricultural Economics Association dealing with market power and its control in the food system. Part 2 deals with objectives and trends in competition policy, and discusses: the theory and practice of antitrust; law and economics; the legal and economic analysis of distribution restraints; and antitrust and the Schumpeterian model with application to the food industry. Part 3 examines competition in a world setting, focusing on: a world perspective of the evolution of industrial policies; global competition and the alleged redundancy of antitrust, the limited international reach of U.S. antitrust policy; and agricultural cooperatives under EEC antitrust regulations. Part 4 is concerned with market entry and examines: entry barriers in the food industry; entry patterns and strategic interaction in food retailing; and advertising and entry. Part 5 deals with mergers and discusses: aggregate concentration; evidence for and against changes in public policy toward mergers; operating performance of acquired firms in banking; and the effects of mergers and entry on concentration change in grocery retailing markets. The last part covers market structure and performance, focusing on: concentration and price; the effect of market structure on the cost of borrowing; the inflationary contribution of market structure in food and tobacco manufacturing, and advertising-induced price differentials and profit differences. Contributors are mainly economists. Wills is Senior Research Analyst in the Department of Agricultural Economics at the University of Wisconsin, Madison. Caswell is Assistant Professor of Agricultural and Resource Economics at the University of Massachusetts. Culbertson is a senior

analyst with National Economic Research Associates, Washington, D.C. Index.

#### 620 ECONOMICS OF TECHNOLOGICAL CHANGE

BERNSTEIN, JEFFREY I. *Research and development, tax incentives, and the structure of production and financing*. Ontario Economic Council Research Studies series. Toronto; Buffalo and London: University of Toronto Press, 1986. Pp. 107. \$9.95, paper. ISBN 0-8020-6629-1. JEL 87-1155

Estimates the effectiveness of the various R&D investment tax incentives and investigates the manner in which firms finance R&D projects relative to the method of financing investment in plant and equipment. Uses a dynamic econometric model in which demand for R&D capital is determined simultaneously with the demands for labor and plant and equipment capital to identify the effectiveness of tax incentives and the influence of interest rates on R&D expenditures. Provides a survey of literature on R&D investment and reviews the relevant aspects of tax policies and R&D outlays. Calculates the effect that alternative tax incentives exert on the unit cost of R&D expenditures, using data for Canadian firms. Analyzes the factor demands and tax incentive effects and calculates the cost to the government in terms of lost tax revenue of each policy alternative. Concludes that R&D capital demand depends on factor prices and output changes, that tax incentives do exert an effect, and that changes in interest rates do affect the structure of production. Bernstein is a member of the Department of Economics at Carleton University, Ontario. No index.

COOMBS, ROD; SAVIOTTI, PAOLO AND WALSH, VIVIAN. *Economics and technological change*. Totowa, N.J.: Littlefield, Adams; Rowman and Littlefield, 1987. Pp. xv, 296. \$35.95, cloth; \$12.95, paper. ISBN 0-8476-7546-7, pbk. JEL 87-1156

Examination of the economics of innovation. Topics include: the firm, production, and technical change; research and development in the firm; patterns of innovation; technological change, output; employment, and trade; government intervention in technical change; and non-government influences on technical change. Coombs and Walsh are lecturers at the University of Manchester Institute of Science and Technology. Saviotti is Lecturer in Science and Technology Policy at the University of Manchester. Bibliography; index.

FLAMM, KENNETH. *Targeting the computer: Government support and international competition*. Washington, D.C.: Brookings Institution, 1987. Pp. xiii, 266. \$31.95, cloth; \$11.95, paper. ISBN 0-8157-2852-2.

JEL 87-1157

Analyzes the origins and evolution of the role of government in the development of computer technology. Examines the economic impact of computer technology and traces the history of federal support for computer research. Reviews government policies affecting the development of computer technology in the United States, Western Europe, and Japan, and evaluates their aggregate impact. Assesses the role governments have played in the development of advanced computer technology and identifies those areas of potential future concern. Flamm is a research associate in the Brookings Foreign Policy Studies program. Index.

SAFARIAN, A. E. AND BERTIN, GILLES Y., eds. *Multinationals, governments and international technology transfer*. New York: St. Martin's Press, 1987. Pp. 223. \$37.50. ISBN 0-312-00730-2.

JEL 87-1158

Twelve papers originally presented at a conference on International Technical Transfers, Multinational Enterprises and National Policies in Advanced Countries at the University of Paris, Dauphine, in September 1985, sponsored by l'Association de Recherche Economique en Propriété Intellectuelle et Transferts Techniques and the Canadian Economics Association. The editor summarizes the contributions and highlights some of the implications for national policies on technology transfer. Papers discuss: an integrated approach to multinational enterprises, international investments, and technology transfers; trends in technological competitiveness within the OECD; a Canadian case study of international knowledge transfers and competitiveness; contractual agreements and international technology transfers; transfer partners and policies; technology development; timing, mode, and terms of technology transfer; and Canadian direct foreign investment. Also includes industry studies dealing with: pharmaceutical products in Canada; Franco-Japanese international investment, protection, and technical transfer; technology transfer in the French automotive equipment industry; and the transfer of Japanese automobile technology to North America. Safarian is Professor of Economics at the University of Toronto. Bertin is Research Director of AREPIT, Paris. Bibliography; author and subject indexes.

SCHMANDT, JURGEN AND WILSON, ROBERT, eds. *Promoting high-technology industry: Initiatives and*

*policies for state governments*. Boulder, Colo. and London: Westview Press in cooperation with the Houston Area Research Center, 1987. Pp. 283. \$35.00, paper. ISBN 0-8133-7427-8.

JEL 87-1159

Results of a study sponsored by the Lyndon B. Johnson School of Public Affairs, University of Texas, which examines the attempts of California, Florida, Massachusetts, Minnesota, New York, North Carolina, Pennsylvania, and Texas to foster economic development through science and advanced technology industries. Identifies and analyzes the actors in the policy development process, their motivations, the policy directions chosen, and the science and technology programs adopted in each of the eight states. Presents lessons drawn from the comparison of the eight states examined and considers future policy developments. Schmandt is Director of the Woodlands Center for Growth Studies, Houston Area Research Center, and a Professor of Public Affairs at the University of Texas. Wilson is Associate Professor at the Lyndon B. Johnson School of Public Affairs, University of Texas. Index.

STANBACK, THOMAS M., JR. *Computerization and the transformation of employment: Government, hospitals, and universities*. Boulder, Colo. and London: Westview Press, 1987. Pp. xv, 151. \$28.50. ISBN 0-8133-7320-4.

JEL 87-1160

Examines the current status and future prospects for computerization in the nonprofit sector—municipal governments, hospitals, and universities—focusing on its impact on the restructuring of work. Presents an overview of computer usage and analyzes computerization in New York City government, in hospitals, and in universities and colleges. Concludes that the major nonprofit organizations face opportunities for cost control and revitalization, and that the principal policy changes required by computerization involve major restructuring of educational and training institutions. Stanback is Professor Emeritus of Economics at New York University and Senior Research Scholar at Conservation of Human Resources, Columbia University. Index.

SWEENEY, G. P. *Innovation, entrepreneurs and regional development*. New York: St. Martin's Press, 1987. Pp. xvi, 271. \$35.00. ISBN 0-312-00489-3.

JEL 87-1161

Focuses on the major determinants of regional economic growth and prosperity from the perspective of entrepreneurial vitality, the innovative potential of the region, and the quality of information flow among firms. Takes into account the interdependence of private and public action and analyzes

the role of small firms and their interactions with the larger ones. Emphasizes that the role of the customer is critical for entrepreneurial innovation, arguing that firms will not compete internationally if their major customers are not technically progressive. Considers the importance of the social environment, including attitudes conducive to developing an information network and stimulating mutual creativity. Describes the necessary conditions for an information-rich climate, emphasizing education and training, information flows, and technical culture. Presents empirical data on small firms in European less-favored regions, finding confirmation of the role of a progressive customer in providing entrepreneurial potential with innovative opportunity. Concludes that it is local regions and not nations that are the environments in which entrepreneurs exist and establish new firms and that each action should consider the total environment, with innovations being multi-functional. Adds that large, centralized firms seem to have a limited life as innovative units and that the optimum approach is to focus on the small firm sector. Sweeney, formerly with the Institute for Industrial Research and Standards in Ireland, has his own consulting firm. Index.

### 630 INDUSTRY STUDIES

ANDERSON, DAVID L. *An analysis of Japanese coking coal procurement policies: The Canadian and Australian experience.* Kingston, Ontario: Queen's University Centre for Resource Studies, 1987. Pp. xvii, 222. Paper. ISBN 0-88757-063-6.

JEL 87-1162

Assesses the impact of the coordinated coking coal procurement system of the Japanese steel mills on suppliers in Australia and Canada and evaluates the existing and contemplated policy responses by these governments. Covers events from the late 1940s to June 1986. Explores the validity of the allegation that the Japanese mills act as oligopsonists in the coking coal market. Presents a broad overview of the coking coal industry, emphasizing the demand side and technological change. Describes the Japanese procurement system, followed by an analysis of the supply side, particularly from the perspective of cartelization theory. Reviews the Australian experience and the policy debate in focusing on attempts to counteract market imperfections. Concludes that radical changes are unlikely to occur on the supply side and that more attention must be given to the demand side by

the exporting nations. Anderson is Executive Director of the Centre for Resource Studies and Adjunct Professor of Public Administration, Queen's University. No index.

BROCK, WILLIAM A. AND EVANS, DAVID, S. *The economics of small businesses: Their role and regulation in the U.S. economy.* With contributions by BRUCE D. PHILLIPS. CERA Research Study series. New York and London: Holmes and Meier, 1986. Pp. xi, 215. \$54.50. ISBN 0-8419-0848-6.

JEL 87-1163

Examines the role of small business in the economy and develops a theoretical framework for examining their formation, growth, and dissolution. Summarizes theories and facts concerning small business. Examines how the importance of small business ventures has changed in the last twenty-five years. Discusses why policy makers and economists are concerned about small businesses and examines how these firms differ from the larger ones. Presents a framework for analyzing the impact of government regulation and taxation. Discusses the practice of tiering regulations and examines the circumstances for optimal tiering schemes. Examines the differential impact of regulations across business sizes and includes empirical results of studies on business formation, dissolution, and growth. Concludes with a review of the functions and contributions of small businesses. Brock is Frank P. Ramsey Professor of Economics at the University of Wisconsin. Evans is Associate Professor of Economics and Adjunct Associate Professor of Law at Fordham University. Bibliography; index.

FARZIN, Y. HOSSEIN. *Competition in the market for an exhaustible resource.* Contemporary Studies in Energy Analysis and Policy series, vol. 6. Greenwich, Conn. and London: JAI Press, 1986. Pp. xvi, 209. ISBN 0-89232-604-2. JEL 87-1164

Develops and employs the economic theory of exhaustible resources in the analysis of issues that have arisen since the energy crisis of the early 1970s. Examines exhaustible resource depletion, the rate of discount, and substitute technology. Analyzes the effects of regulation on the supply of an exhaustible resource. Employs the economic theory of exhaustible resources to derive a supply function for non-OPEC producers and estimates it using U.S. crude oil data. Assesses the performance of the model and presents suggestions for future research. Farzin is at the Development Research Department of the World Bank. Bibliography; index.

GJØLSBØ, OLE AND EILERTSEN, INGER-LISE. *Oil products: Studies of price relationships, 1975-*

1985. FMD Research Report Series, no. 59. Oslo: Fondet for markeds- og distribusjonsforskning, 1986. Pp. v, 73. Paper. ISBN 82-7284-089-8.

JEL 87-1165

Examination of the relative prices of gasoline, naphtha, gas oil, and heavy fuel oil. Surveys the level, trend, and variability of price differentials using price observations from the Rotterdam market. Presents a selective survey of the relevant literature and a model of the forces behind the relative oil-product prices. Analyzes the relationship between energy content and price. Discusses the relationship between crude differentials, OPEC announcements, and product differentials. Examines seasonal regularities in product prices and spreads. No index.

JOHNSON, PAUL. *Consolidated gold fields: A century portrait*. New York: St. Martin's Press, 1987. Pp. 256. \$29.95. ISBN 0-312-00549-0.

JEL 87-1166

Portrait of Consolidated Gold Fields, which describes the origins, history, and present objectives of the South African company co-founded by Cecil John Rhodes in 1887. Focuses on the people involved, associating Gold Field's history with the creative aspect of capitalism. Presents a review of the rise and development of Consolidated Gold Fields; the achievements, problems, and opportunities in South Africa; operations in America; the investment in the Newmont Mining Corporation in the United States; building for the future in Australia; and the success of ARC Limited, a British subsidiary. Examines the core strategy of the company and concludes with a look into the next century. Johnson is a writer, lecturer, and broadcaster. Index.

PENNINGS, JOHANNES M. AND BUITENDAM, AREND, eds. *New technology as organizational innovation: The development and diffusion of microelectronics*. Ballinger Series on The Management of Innovation and Change. Cambridge, Mass.: Harper and Row, Ballinger, 1987. Pp. xvi, 308. \$29.95. ISBN 0-88730-186-X.

JEL 87-1167

Thirteen papers, based on a symposium held at the Netherlands Institute for Advanced Studies during the summer of 1985, explore organizational innovation and the ramifications of the diffusion of semiconductor technology. Discusses the nature of the new technology as organizational innovation and innovation theory. Examines organizational adoption processes, including the justification process for new technology, the horizontal perspective of organization design and new technology, technological innovation and organizational conservatism,

and technology policy and innovation in organizations. Discusses areas of adoption, focusing on: managerial strategies, a marketing perspective on the diffusion of high technology, technological innovations in manufacturing, and the limits of information technology. Presents conclusions and examines integration, focusing on: the diffusion of technological innovation, new technology and organizational change, and a managerial perspective of information technology. Contributors are mainly academics specializing in Sociology, Management and Marketing. Pennings is Associate Professor in the Department of Management at the Wharton School at the University of Pennsylvania. Buitendam is Lecturer in the Department of Sociology at the State University of Groningen, Netherlands. Index.

RUTH, STEPHEN R. AND MANN, CHARLES K., eds. *Microcomputers in public policy: Applications for developing countries*. AAAS Selected Symposia Series, no. 102. Boulder, Colo.: Westview Press for the American Association for the Advancement of Science, Washington, D.C., 1987. Pp. viii, 170. \$18.95, paper. ISBN 0-8133-7144-9.

JEL 87-1168

Nine papers discuss the use of microcomputers in the formulation and execution of public policy in developing countries. Papers discuss: microcomputers in public policy and human capital development; problems arising in the introduction of microcomputers into third world countries; guidelines to the successful application of microcomputers; energy applications of microcomputers; use of microcomputers to improve budgeting and financial management in the ministry of agriculture in Kenya; government budgeting in Africa; management factors affecting the impact of microcomputers on government decision making; acquiring micro-based software in developing countries; and technology-sharing organizations. The contributors are mainly economists. Mann is Research Associate at the Harvard Institute for International Development. Ruth is Professor of Decision Sciences at George Mason University. Index.

WILLIAMS, KAREL; WILLIAMS, JOHN AND HASLAM, COLIN. *The breakdown of Austin Rover: A case study in the failure of business strategy and industrial policy*. Leamington Spa, England and Hamburg, Berg; distributed in the United States and Canada by St. Martin's Press, New York, 1987. Pp. v, 150. \$27.50, cloth; \$10.95, paper. ISBN 0-85496-515-7.

JEL 87-1169

Examines the recovery strategy developed by Sir Michael Edwards for British Leyland between

1977 and 1983. Discusses the labor productivity problem and investment strategy. Considers the problems posed by the car market in Britain and abroad, and examines relevant policy issues. Concludes that the Edwardes strategy was a failure, leaving the company with little prospect of an independent future unless a change in government policy occurs. Karel and John Williams teach economic history at the University College of Wales. Haslam teaches economics at North East London Polytechnic. Select bibliography; index.

WINSTON, CLIFFORD, ET AL. *Blind intersection? Policy and the automobile industry*. Washington, D.C.: Brookings Institution, 1987. Pp. xii, 108. ISBN 0-8157-9466-5. JEL 87-1170

Seven essays evaluate government policies for increasing the competitiveness of U.S. automobile manufacturers and for solving social problems associated with the automobile. Considers the cost competitiveness of the U.S. industry, the U.S. market demand, the economic effects of voluntary export restrictions, recent safety proposals, expectations and automobile policy, and public policy and auto industry evolution. Suggests that U.S. automakers will be able to compete relatively successfully with foreign manufacturers for a substantial share of the U.S. market; however, U.S. employment in the industry will be reduced as manufacturers continue using foreign production sources and other cost-cutting measures. Winston is Senior Fellow in the Brookings Economic Studies program. Coauthors are Ana Aizcorbe, Research Economist at the Bureau of Labor Statistics; Ann Friedlaender, Dean of Social Sciences and Humanities at the Massachusetts Institute of Technology; Fred Mannering, Assistant Professor of Civil Engineering at the University of Washington; and Dennis Sheehan, Assistant Professor of Management at Purdue University. Index.

YOSHIMURA, HIROSHI. *Distribution relation analysis of wholesale and retail in Japan*. Paper Series, no. 5. Yamaguchi City, Japan: Yamaguchi University, Economic Society, 1986. Pp. 98. Paper.

JEL 87-1171

An application of distribution relation analysis to wholesale and retail trade in Japan. Defines coefficients, derives the expression for potential demand, and constructs a wholesale and a retail relation table. Uses data for 1979 to estimate: potential demand, its structure, and regional distribution; the realization ratio; conditioning factors; semi-aggregated sectoral sales; and the wholesale-retail ratio with semi-aggregated sectors. Yoshimura is

Professor of Economics at Yamaguchi University, Japan. No index.

## 700 Agriculture; Natural Resources

### 710 AGRICULTURE

BAR-EL, RAPHAEL, ed. *Rural industrialization in Israel*. With the assistance of AMIELA NESHER. Westview Special Studies in Industrial Policy and Development series. Boulder, Colo. and London: Westview Press in cooperation with the Settlement Study Centre, 1987. Pp. xi, 193. \$25.00, paper. ISBN 0-8133-7393-X. JEL 87-1172

Six essays examine the industrialization process in Israel, focusing on: the kibbutz, the moshav, the nonagricultural village, and the Arab village. The essays present the general background and define the specific developments of each village. The contributions review relevant conditions at local and regional levels, analyze experiences of industrial development, evaluate the achievement and attainment of development goals, and determine influential factors. Includes considerations for rural industrialization in Israel, concentrating on: objectives, the rural setting as a constraint to industrialization, constraints related to the organizational and ideological structure of the village, external influences, links between manufacturing and agriculture, and characteristics of industrial technology. Bar-El is an economist at the Settlement Study Centre, Israel. No index.

CORNELISSE, PETER A. AND NAQVI, SYED NAWAB HAIDER. *The wheat-marketing activity in Pakistan*. Islamabad: Pakistan Institute of Development Economics; Rotterdam: Erasmus University, Centre for Development Planning, 1987. Pp. xii, 125. Paper. JEL 87-1173

Report of a research project conducted between 1981 and 1983 that surveys and analyzes the working and modalities of the wheat markets in Pakistan. Assesses the strengths and weaknesses of the wheat-market network by examining the various channels through which wheat travels from the farmer to the consumer. Examines: the production and marketed surplus of wheat by farmers, the role of wheat traders and the wheat-trade network, the operation and profitability of wheat-milling, the ration-shop system, patterns of wheat consumption, wheat losses and storage, and the wheat

procurement and distribution systems. Concludes with an outline of policy recommendations and chapter summaries. Cornelisse is at the Center for Development Planning, Erasmus University, Rotterdam. Naqvi is at the Pakistan Institute of Development Economics, Islamabad. No index.

- FRIIS-HANSEN, ESBERN. *Changes in land tenure and land use since villagization and their impact on peasant agricultural production in Tanzania: The case of the Southern Highlands*. CDR Research Report series, no. 11. IRA Research Paper series, no. 16. Copenhagen: Centre for Development Research, 1986. Pp. 155. Paper. ISBN 87-88467-38-4. JEL 87-1174

Analysis of the impact on peasant agriculture of the compulsory movement of Tanzania's rural population into nuclear villages during 1974-75. Presents a historical review of village development in Tanzania and the implementation of villagization in the Iringa region. Discusses the evolution of land tenure and examines: traditional forms of tenure; changes in tenure as a result of this policy; and official codes in the new agricultural policy of 1983. Conducts case studies of the Maliwa, Ngamanga, and Mamongolo villages, focusing on: village history; the balance between settlement and land use; and changes in the farming system since 1974-75. Assesses the impact of this policy and considers some future prospects. No index.

- GITTINGER, J. PRICE; LESLIE, JOANNE AND HOISINGTON, CAROLINE, eds. *Food policy: Integrating supply, distribution, and consumption*. EDI Series in Economic Development. Baltimore and London: Johns Hopkins University Press for the World Bank, 1987. Pp. xiv, 567. Paper. ISBN 0-8018-3500-3. JEL 87-1175

Thirty-eight papers discuss issues in the area of food policy. Part 1 deals with current thinking regarding food policy and the world food situation. Part 2 focuses on the implications and status of programs to increase food production. Part 3 examines the relationship between, and trends in, food security, trade, and aid. Part 4 analyzes domestic distribution and the effects of price policies and subsidies. Part 5 deals with the problem of malnutrition and policies for nutrition interventions. Part 6 covers the lessons from experiences in food and nutrition planning. The contributors are nutritionists, agricultural economists, and members of international organizations. Gittinger is an agricultural education and training advisor in the Policy Division of the World Bank. Leslie is a staff nutritionist at the International Center for Research on Women. Hoisington is a project officer with Africare Senegal. Bibliography; index.

- INTERNATIONAL RICE RESEARCH INSTITUTE. *World rice statistics, 1985*. Manila: International Rice Research Institute, 1986. Pp. 271. Paper. ISBN 971-104-164-2. JEL 87-1176

Brings together data on rice production, consumption, prices, and other relevant statistics from various international and national sources. Current volume has a new format and revised contents, including use of FAO publications as the source of data on production, area, yield, and trade, and more tables depicting rice trade by origin and destination, the effect of tariff and nontariff measures on rice, and carry-over stocks of rice. Ninety-seven tables are divided into the following areas: production, area, and yield; imports and exports; consumption and stocks; modern rice varieties; land use, irrigation, and farm size; fertilizer use and prices; population and labor force; wages; domestic prices; and international prices and tariff and nontariff measures. Five appendix tables present data on wholesale and consumer price indexes, official exchange rates, crop calendar by country milling rates, and import conversion factors. No index.

- KELLMAN, MITCHELL. *World hunger: A neo-Malthusian perspective*. New York and London: Greenwood Press, Praeger, 1987. Pp. xviii, 242. \$38.95. ISBN 0-275-92247-2. JEL 87-1177

Analyzes food productivity from 1885 to the present. Reviews the literature of the modern era regarding the long-term relationship between man and food and assesses alternative models explaining the nature of this long-term dynamic relationship. Discusses the methodological groundwork and the analytical framework required for discrimination among competing hypotheses. Presents a statistical analysis of selected multicountry wheat and rice regions for technological epochs for each region to determine the nature and evolution of food-producing technology. Assesses the evidence of effective Malthusian pressures on basic technological changes in agricultural technology. Discusses the findings in terms of competing models of world food supply. Kellman is Professor of Economics at the City University of New York. Bibliography; index.

- MCBRIDE, GLYNN. *Agricultural cooperatives: Their why and their how*. Westport, Conn.: AVI, 1986. Pp. xvii, 352. \$42.50. ISBN 0-87055-534-0. JEL 87-1178

Undergraduate textbook about the economic rationale and legal underpinning of agricultural cooperatives in the U.S., their role in the economy and their potential role in solving marketing problems. The text is designed for use in a one-semester course in agricultural economics or marketing.

ribusiness, and other related areas, and assumes some knowledge of economic principles. Part 1 explores the economic rationale for the farm cooperative institutional arrangement, focusing on: the relationship between group action and marketing and structure; the structure of agriculture and agricultural input and output industries; and the history of U.S. antitrust policy and its significance to agricultural cooperatives. Part 2 discusses the improvement of agricultural cooperatives and examines: cooperative principles; economic feasibility; management; financing; equity redemption plans; taxes; federal marketing orders; commodity market pools; member education; communications; leadership development; performance measurement; and issues and challenges facing agricultural cooperatives. Includes end-of-chapter questions and learning suggestions. A workbook of cases in cooperative marketing is also available. McBride is a member of the Department of Agricultural Economics, Michigan State University. Index.

MORRIS, MICHAEL L. *Rice marketing in the Senegal river valley: Research findings and policy reformulations*. MSU International Development Paper Series, no. 8. East Lansing, Mich.: Michigan State University, Department of Agricultural Economics in collaboration with the Senegal Agricultural Research Institute, 1987. Pp. xv, 89. \$5.00, paper.

JEL 87-1179

Presents the results of regional studies of cereal markets in the Senegal River valley. Describes the food deficit situation and agricultural development strategy of Senegal. Outlines the organization of rice markets in the Senegal River valley and assesses their performance. Discusses available policy reform options, and considers potential barriers to reform as well as means of increasing the effectiveness of policy reforms. Morris is associated with the Economics Program at the International Maize and Wheat Improvement Center in Mexico.

PEARSON, SCOTT R., ET AL. *Portuguese agriculture transition*. Ithaca and London: Cornell University Press, 1987. Pp. 283. ISBN 0-8014-1954-9.

JEL 87-1180

Fourteen papers examine different aspects of Portuguese agriculture and suggest ways of improving efficiency and productivity. Part 1 examines: constraints on the development of Portuguese agriculture; methods of analysis; commodity policies; and agricultural factor markets. Part 2 focuses on comparative advantage in Portuguese agriculture and discusses: extensive farming in the Alentejo; intensive farming in the Vale do Tejo; dairying in the Azores; and intensive agriculture in the northwest. Part 3 examines agricultural change in

the Northwest and discusses patterns of technical change as well as future technical and structural adjustments in Northwestern agriculture. Part 4 discusses future commodity policies; future policies influencing agricultural factor markets; and Portuguese agricultural strategies. Coauthors are: Francisco Avillez, Jeffery W. Bentley, Timothy J. Finan, Roger Fox, Timothy Josling, Mark Langworthy, Eric Monke, and Stefan Tangermann. Pearson is a professor at the Food Research Institute, Stanford University. Index.

PENNY, DAVID H. *Starvation: The role of the market system*. Canberra, Australia: Australian National University, 1986. Pp. xvii, 124. Paper. ISBN 0-86784-825-1.

JEL 87-1181

Examines famines that occur in economies where market exchange is the dominant force in resource allocation. Discusses death from starvation as the ultimate economic problem, the economics of starvation in a market situation, micro evidence from two villages in Indonesia, the place of starvation in modern economic theory, working toward the elimination of mass starvation, and the market system and general economic welfare. Offers an economic model that gives priority to human well-being rather than to industrial-commercial progress. The late David H. Penny was Director of Research, Department of Aboriginal Affairs, Government of Australia. Glossary; no index.

PINGALI, PRABHU; BIGOT, YVES AND BINSWANGER, HANS P. *Agricultural mechanization and the evolution of farming systems in Sub-Saharan Africa*. Baltimore and London: Johns Hopkins University Press for the World Bank, 1987. Pp. viii, 216. \$22.50. ISBN 0-8018-3503-X.

JEL 87-1182

An attempt to discover the reasons underlying the limited extent of mechanization of Sub-Saharan agriculture. On the basis of a review of the literature and field visits, the authors examine: the evolution of societies from shifting to permanent cultivation of land; the role of agroclimatic, soil, and infrastructural constraints in this evolution; the conditions necessary for a transition from the hand hoe to the plow; the persistence of the hand hoe in some areas despite efforts at mechanization; and possible policies and projects to promote the growth of agricultural mechanization. Part 1 analyzes the decision to plow. Part 2 focuses on issues relevant to the use of animal draft, and Part 3 examines the shift to motorized agriculture. Pingali is an economist at the International Rice Research Institute. Bigot is a researcher at the Centre de Coopération Internationale en Recherche Agronomique pour le Développement. Binswanger is chief of the Agricultural Research Unit of the

World Bank's Agriculture and Rural Development Department. Index.

PROSTERMAN, ROY L. AND RIEDINGER, JEFFREY M. *Land reform and democratic development*. Johns Hopkins Studies in Development series. Baltimore and London: Johns Hopkins University Press, 1987. Pp. xii, 313. \$29.50. ISBN 0-8018-3482-1.

JEL 87-1183

Argues that a program of land reform and rural development that highlights the role of the family farm can avert millions of hunger and health-related deaths and create the conditions for voluntary population control. Part 1 focuses on the roots of development and discusses: landlessness and revolution; tenure, equity, and productivity; assessments beyond agriculture—birth, death, and freedom; and four alternative models of development. Part 2 discusses family farming in South Vietnam and land reform in El Salvador. Part 3 presents prescriptions for future development and examines: guiding principles of land reform; complementary programs; and the universalization of a family-farm model. Prosterman is a professor at the University of Washington School of Law. Riedinger is a doctoral fellow at the Woodrow Wilson School of Public and International Affairs, Princeton University. Index.

SCOTT, R. H. *The value of land in Australia*. Research Monograph series, no. 47. Canberra: Australian National University, Centre for Research on Federal Financial Relations; distributed by ANU-TECH, 1986. Pp. ix, 99. Paper. ISBN 0-86784-988-6.

JEL 87-1184

Examines the valuation of land in Australia. Discusses: Australian economic history and the value of land; government and land valuation; the problems associated with land valuation; the value of land in the aggregate; interstate differentials; and issues relevant to valuation reform, tax reform, and land management. Appendices examines: land as a component of national wealth; local government in Australia; valuation legislation; and supplementary statistics. Scott is an economist. Bibliography; no index.

SWAMINATHAN, M. S. AND SINHA, S. K., eds. *Global aspects of food production*. Natural Resources and the Environment Series, vol. 20. London; River-ton, N.J. and Dehra Dun, India: Tycooly International, 1986. Pp. xx, 449. Paper. ISBN 1-85148-009-9.

JEL 87-1185

Eighteen contributions examine the global food situation and provide information relevant to the promotion of an international agricultural system based on ecology, efficiency, and equity. Topics

discussed include: food production needs, the quantitative dimensions of the nutrition problem, energy balance in agriculture, research and technology needs, germplasm resources, climate and production, water resources and their role in food production, requirements and management of nitrogen fertilizer, chemical technology for producing fertilizer nitrogen, the role of phosphorus in global food production, potassium requirements and resources, the problems and prospects of salt-affected soils, the significance of desertification, insect control, the management of disease, and building nutrition security systems. Swaminathan is Director General of the International Rice Research Institute in the Philippines. Sinha is Professor of Plant Physiology at the Water Technology Centre, Indian Agricultural Research Institute, New Delhi. No index.

## 720 NATURAL RESOURCES

BERGESEN, HELGE OLE; MOE, ARILD AND ØSTRENG, WILLY. *Soviet oil and security interests in the Barents Sea*. New York: St. Martin's Press, 1987. Pp. xv, 144. \$29.95. ISBN 0-312-00491-5.

JEL 87-1187

Analysis of the prospects for Soviet oil production in the Barents Sea. Focuses on the importance of the Barents Sea as a source of energy for the Soviet Union and the potential economic, military, and political problems associated with the development of petroleum production in the area. Assesses the importance of the Barents Sea as an energy option for the Soviet Union. Reviews the process of Soviet oil exploration in the Barents Sea and analyzes the possible conflict of interest between petroleum and military strategy. Outlines the major options available to the Soviet Union with respect to petroleum production in the Barents Sea. Appendices provide details of Barents Sea offshore research, planning, and development, and Soviet offshore-related purchases from abroad. Østreng is Director, Moe is Director of Soviet Studies, and Bergesen is Senior Research Fellow, Fridtjof Nansen Institute, Oslo. Index.

[CRUTCHFIELD, JAMES A.] *Natural resources economics and policy applications: Essays in honor of James A. Crutchfield*. Edited by EDWARD MILES; ROBERT PEALY AND ROBERT STOKES. Foreword by BREWSTER C. DENNY. Public Policy Issues in Resource Management series. Seattle: Institute for Public Policy and Management, Institute for Marine Studies, and University of Washington Graduate School of Public Affairs; distributed by Univer

ity of Washington Press, Seattle and London, 1986. Pp. xiii, 440. \$30.00. ISBN 0-295-96345-1. JEL 87-1188

Seventeen papers in honor of James A. Crutchfield, Professor Emeritus of Economics and a professor in the Institute for Marine Studies at the University of Washington. Papers focus on the contributions of economics to policy making regarding natural resources. Part 1 reflects the interaction of economics and policy, discussing the ways in which economics is useful in the solution of natural resource problems, the relationships between man and nature, and the impact of economics on the development of fisheries policy. Part 2 examines substantive issues such as catch quotas and shares in the fishstock as property rights, historical dynamics of the fisheries of Georges Bank, small scale fishery management in developing countries, appropriate strategies for development of fisheries, the importance of law enforcement in the fisheries industry, and large-scale water transfers in North America. Part 3 deals with analytical and methodological issues, including uncertainty and option value in environmental policy, estimating resource depletion costs, environmental risk and resource development, implications of the absence of stock-recruitment relationships in fisheries management, and the utility of static versus dynamic models in fisheries management. Part 4 is concerned with the issue of bringing specialized knowledge to bear on policy making, discussing inter-disciplinary research and environmental management. Contributors are mainly economists. Miles and Stokes are both at the Institute of Marine Studies and professors at the University of Washington. The late Robert Pealy was Professor Emeritus of Public Affairs at the University of Washington. Index.

DLEY, DON. *World energy: The facts and the future*. Second edition. New York and Oxford: Facts on File, [1981] 1986. Pp. 290. \$45.00. ISBN 0-7160-1615-1. JEL 87-1189

Second revised and updated edition examines the current world energy situation. [See JEL no. 87-0241 for annotation of the first edition.] Part 1 examines world energy consumption and reserves, and presents the outlook for world energy to the year 2000. Part 2 focuses on the potential cost, supply, and outlook for coal, natural gas, oil, nuclear energy, and electricity. Part 3 analyzes energy demand and supply throughout the world. Part 4 presents future issues and discusses questions regarding conservation, the environment, synthetic fuels, and the prospects beyond 2000. One hundred fifteen statistical tables provide information on fuel consumption, production, and demand. Bibliography; no index.

JAPAN MINISTRY OF AGRICULTURE, FORESTRY AND FISHERIES, STATISTICS AND INFORMATION DEPARTMENT. *Fisheries statistics of Japan, 1984*. Annual. Tokyo: Association of Agriculture-Forestry Statistics, 1986. Pp. 64. Paper. JEL 87-1190

A yearly publication providing information on the structure of production, marketing, and the economic situation of Japanese fisheries. [See JEL no. 86-0568 for annotation of previous edition.] Consists of twenty-one statistical charts and twenty-five statistical tables, including two reference tables on world catch for 1979-1983. No index.

KLEINDORFER, PAUL R. AND KUNREUTHER, HOWARD C., ed. *Insuring and managing hazardous risks: From Seveso to Bhopal and beyond*. New York; Berlin; London and Tokyo: Springer, 1987. Pp. ix, 534. ISBN 0-387-17732-9. JEL 87-1191

Seventeen papers presented at the "International Conference on Transportation, Storage, and Disposal of Hazardous Materials" held in Lunenburg, Austria, in July 1985. Part 1 presents historical background and focuses on: learning to cope with crises; the engineering aspects of severe accidents; the Seveso accident; and compensation for environmental damage. Part 2 discusses: insurance and compensation as policy instruments for hazardous waste management; bargaining and negotiation in hazardous waste management; and the siting of hazardous waste facilities. Part 3 focuses on risk analysis and examines: chemical hazard risk assessment; methods of risk analysis; educating and informing the public about risk; and value tree analysis as applied to offshore oil drilling. Part 4 deals with risk management and insurance, and discusses: regulating environmental risks; chemical industry hazards; environmental impairment liability; the legal regime and insurance problems of transporting hazardous materials by sea; insuring environmental liabilities; and the role of insurance in risk spreading and risk bearing. The contributors are mainly environmental and social scientists, risk analysts, and insurance and legal experts. Kleindorfer is Professor of Decision Sciences and Economics, and Kunreuther is Professor of Decision Sciences and Public Policy and Management, both at the University of Pennsylvania. Index.

MCILIN, JON. *Social and economic effects of petroleum development in non-OPEC developing countries: Synthesis report*. Geneva: International Labour Office, 1986. Pp. xiii, 104. Paper. ISBN 92-2-105505-1. JEL 87-1192

Synthesis of the findings of an ILO research project conducted between 1979 and 1985 for the purpose of assisting oil and gas producers in the non-

South, Sewanee, Tennessee, explore the theoretical, empirical, and policy dimensions of the significance of the stickiness of wages as a primary factor in causing the persistence of high unemployment in industrialized nations. Topics include: discussion of rigid wage rates versus wage flexibility; a new method for measuring wage flexibility; analysis of institutions and incentives as causes of wage inflexibility; an examination of the effects of layoffs by seniority on wage rigidity; an investigation of the effects of union activity on wage rigidity and unemployment; a survey of macroeconomic policies followed in the past; proposals for a wage tax and worker-subsidy scheme to reduce the natural rate of unemployment; the macroeconomics of profit-sharing; and wage indexation and macroeconomic fluctuations. Contributors are economists. Beckerman is Lord Thompson Fleet Fellow, University Reader, and tutor in economics at Balliol College, Oxford. Index.

BENERÍA, LOURDES AND ROLDÁN, MARTHA. *The crossroads of class and gender: Industrial homework, subcontracting, and household dynamics in Mexico City*. Women in Culture and Society series. Chicago and London: University of Chicago Press, 1987. Pp. xii, 204. \$42.00, cloth; \$15.95, paper. ISBN 0-226-04232-4, pbk. JEL 87-1202

Interdisciplinary study combining economic, sociological, and anthropological perspectives that investigates the reasons behind the growing concentration of women in the "informal sector" of the Latin American economy. Examines the economic and political implications both for the women involved and for the evaluation of employment policies that are promoting this sector. Explores the specific life situations and problems facing this group of Mexican women. Focuses on industrial homework, particularly the garment, toymaking, plastics, and electronics industries, noting that the majority of these workers are women. Examines how class and gender are articulated in a concrete working and living situation, and the dynamics of an industrial labor market within the context of development problems. Addresses questions concerning the industries involved, the tasks performed at home, subcontracting, and the labor market dynamics that result. Benería is Professor of City and Regional Planning and Women's Studies, Cornell University. Roldán is a Professor of Sociology, University of Buenos Aires. Bibliography; index.

BODIE, ZVI; SHOVEN, JOHN B. AND WISE, DAVID A., eds. *Issues in pension economics*. National Bureau of Economic Research Project Report series. Chicago and London: University of Chicago Press,

1987. Pp. ix, 376. \$45.00. ISBN 0-226-06284-8. JEL 87-1203

Eleven papers with discussants' comments, presented at a conference held in San Diego, April 1984. Papers in part 1 discuss changing philosophy about the rationale for pension funds, considering: funding and asset allocation in corporate pension plans; pension policy and the value of Pension Benefit Guarantee Corporation Insurance; and how the stock market values pension assets and liabilities. Papers in part 2 deal with the role of pensions in providing an adequate and secure retirement income, discussing concepts and measures of earnings replacement during retirement and the integration of employer pension plans with Social Security. Papers in part 3 address the effects of pensions, including Social Security, on private savings covering: uncertainty and individual savings; annuity markets, savings, and the capital stock; and dissaving after retirement. Papers in part 4 analyze the incentive effects of pension plans on labor market behavior, and pension inequality. Contributors are economists. Bodie is Professor of Finance at Boston University. Shoven is Professor of Economics at Stanford University. Wise is John F. Stambaugh Professor of Political Economy at the John F. Kennedy School of Government, Harvard University. Author and subject indexes.

BROWN, CLAIR AND PECHMAN, JOSEPH A., eds. *Gender in the workplace*. Washington, D.C.: Brookings Institution, 1987. Pp. xiv, 316. \$32.95, cloth; \$12.95, paper. ISBN 0-8157-1170-0, cloth. JEL 87-1204

Eight papers with comments and an introduction by the editors assess the importance of gender in the workforce. Papers discuss the role of gender in the labor market and economy; consumption, work roles, and economic growth between 1918 and 1980; a case study of promotion and segregation by sex in an insurance firm; the dynamics of occupational segregation among bank tellers; subcontracting in Mexico City as a means of reducing women's wages; unions and the female work force; occupational segregation among part-time and full-time workers; the importance of child support for the independence and welfare of single mothers; and the effectiveness of sex-based employment quotas in Sweden. The contributors are mainly economists. Brown is Associate Professor and Associate Director of the Institute of Industrial Relations, University of California, Berkeley. Pechman is Senior Fellow at the Brookings Institution. Index.

DAVIES, STEPHEN AND CAVES, RICHARD E. *Britain's productivity gap*. National Institute of Economic

and Social Research Occasional Papers series, no. 40. Cambridge; New York and Melbourne: Cambridge University Press, 1987. Pp. xiv, 131. \$29.95. ISBN 0-521-33464-0. JEL 87-1205

Analysis of the extent and causes of differences in productivity among British manufacturing industries and between productivity in Britain and the United States. Examines the statistical record of productivity levels in British and American industries and considers the relevance of labor relations, skills of management and labor, and sizes of companies and plants. Outlines an analytical framework for the study of relative industrial productivity and analyzes determinants of relative efficiency. Discusses the relationship between productivity, prices, market structure, and international trade. Examines relative productivity in large plants and relative productivity growth. Presents lessons for analyzing productivity and discusses implications for policy. Index.

DOERINGER, PETER B.; MOSS, PHILIP I. AND TERKLA, DAVID G. *The New England fishing economy: Jobs, income, and kinship*. Amherst: University of Massachusetts Press, 1986. Pp. viii, 147. ISBN 0-87023-535-4. JEL 87-1206

Product of team research begun in 1982 to determine how a shift in the U.S.-Canadian fishing boundary would affect socioeconomic conditions in New England. Focuses on the structure, work force, and adjustments of the New England fishing industry. Reviews the recent history of the fishing industry in New England and discusses the structure of the industry in Gloucester and New Bedford. Examines fishermen, processing workers, and their jobs. Discusses labor market structure and labor force adjustment in the fishing industry, and employment and income alternatives to fishing and processing. Concludes that both kinship and capitalist employment systems exist and discusses the implications of each system for the stability of employment in the fishing industry. Doeringer and Terkla are members of the Department of Economics at Boston University. Moss is Assistant Professor of Economics at the University of Lowell. Index.

ENGLAND, GEOFFREY. *Part-time, casual and other atypical workers: A legal view*. Research and Current Issues Series, no. 48. Kingston, Ontario: Queen's University Industrial Relations Centre, 1987. Pp. 82. Paper. ISBN 0-88886-154-0. JEL 87-1207

Focuses attention on the workers who do not fit the mold of the traditional employment relationship such as part-time employees, seasonal workers, contract workers whose term of employment

is specified, triangle workers hired by one person to do work for another employer, homeworkers, and workers whose employer pays them out of a government subsidy through job-creation programs. Argues that these workers receive inferior treatment under Canadian labor law. Examines their legal position from the perspectives of the common law employment contract, employment standards legislation, and collective bargaining legislation. Describes each group of workers in detail pointing out the main kinds of legal discrimination to which they are subjected. Concludes that these workers are playing an increasingly important role, but continue to face discrimination by the majority. Suggests a number of reforms. England is Professor of Labour Relations at the School of Management, University of Lethbridge. No index.

GUNDERSON, MORLEY; MELTZ, NOAH M. AND OSTRY, SYLVIA, eds. *Unemployment: International perspectives*. Toronto; Buffalo and London: University of Toronto Press for the Centre for Industrial Relations, 1987. Pp. ix, 224. \$25.00, cloth; \$12.95, paper. ISBN 0-8020-6636-4, pbk. JEL 87-1208

Fifteen papers plus comments, presented at an international conference of economists sponsored in November 1984 by the Centre for Industrial Relations at the University of Toronto. Provides a comparative approach for analyzing the causes and possible remedies for the 1980s unemployment problem. Examines unemployment in Western Europe, the United States, and Canada. Describes in detail the situation in the three countries, focusing on topics such as monetary policy and the regulation of inflation, wage behavior and macroeconomic policies, institutional change, flexible wage structures, labor market rigidities, and demographic components. Key issues relate to the effects of restrictive monetary and fiscal policies and whether rigidities prevent labor markets from adjusting to rapid shock effects. Examines industrial relations and their bearing on unemployment, and proposes unemployment remedies, including reducing the standard work week and behavior alteration. Gunderson is Director of the Centre for Industrial Relations and Professor of Economics at the University of Toronto. Meltz is Assistant Dean of the School of Graduate Studies and Professor of Economics and Industrial Relations at the University of Toronto. Ostry is Canadian Ambassador for Trade Negotiations. No index.

ISLAM, RIZWANUL AND MUQTADA, M., eds. *Bangladesh: Selected issues in employment and development*. New Delhi: International Labour Organisation, Asian Employment Programme (ARTEP),

1986. Pp. 297. \$12.00, cloth; \$8.00, paper. ISBN 92-2-105769-0, pbk. JEL 87-1209

Thirteen papers, all previously published, discuss key issues and problems in the development of Bangladesh. Topics include: problems of employment and poverty alleviation; rural and urban unemployment and underemployment; trends in and causes of poverty and inequality; determinants and possibilities of employment expansion in the crop sector; trade, industrialization, and employment; employment generation through cottage industries; present and potential demand for products of rural industries; technology, productivity, and employment in rural industries; employment potentials and problems in the urban informal sector; international migration and the domestic economy; and domestic resource mobilization and self-reliance. Index.

LAYARD, RICHARD. *How to beat unemployment*. With assistance from ANDREW SENTANCE. Oxford; New York; Toronto and Melbourne: Oxford University Press, 1986. Pp. 201. \$29.95. ISBN 0-19-877265-3. JEL 87-1210

Examines the rise in unemployment and discusses how unemployment can be reduced without increasing inflation. Discusses the basic facts about unemployment, the inflation/unemployment quandary, the supply side approach, aggregate demand, and alternative theories. Proposes a four rule strategy to reduce unemployment in the United Kingdom and still contain inflation that involves: creating jobs for those kinds of workers who are unemployed; training and retraining the less skilled, while targeting jobs toward those who remain unskilled; adopting a tax-based incomes policy whereby employers would pay a penalty tax if the growth in their hourly wages exceeded the norm; and defending the pound, where necessary, by higher interest rates. Layard is Professor of Economics at the London School of Economics and head of its Centre for Labour Economics. Index.

McKEE, DAVID L. AND BENNETT, RICHARD E., eds. *Structural change in an urban industrial region: The Northeastern Ohio case*. New York and London: Greenwood Press, Praeger, 1987. Pp. ix, 255. \$39.95. ISBN 0-321-05333-3. JEL 87-1211

Fifteen papers presented at a conference entitled "Appraising the Economy of Northeastern Ohio" sponsored by the Graduate School of Management and the Department of Economics of Kent State University in 1986. Part 1 assesses urban and regional vulnerability to structural economic change. Part 2 deals with some specifics on metropolitan labor markets in northeastern Ohio. Part

3 discusses the implications of deindustrialization and industrial restructuring. Part 4 presents some nonacademic perceptions regarding the impact of emerging technology and the need for international competitiveness. Part 5 assesses Ohio's position in the regional life cycle and outlines certain policy considerations. The contributors are mainly economists. Bennett and McKee are Professors of Economics at Kent State University. Selected bibliography; index.

NOYELLE, THIERRY J. *Beyond industrial dualism: Market and job segmentation in the new economy*. Conservation of Human Resources Studies in the New Economy series. Boulder, Colo. and London: Westview Press, 1987. Pp. xii, 140. \$28.50. ISBN 0-8133-7301-8. JEL 87-1212

Examination of the changes that are currently taking place in the labor market, focusing on structural developments such as the shift from manufacturing to services, the increasing internationalization of the world economy, and the introduction of new computer-communications technology. Discusses the processes of market and job segmentation that arose under industrial dualism and that are now weakening and disappearing. Presents three case studies to illustrate the hypothesized changes and identify emerging new processes of segmentation: R. H. Macy and Company in retailing; New York Telephone representing utilities; and an unnamed large insurance firm. Conceptualizes the new processes of segmentation and illustrates the new labor market interactions being brought about among major groups of workers. Concludes with a discussion of the implications for policy, emphasizing the changing nature of mobility, the role of educational institutions, and the implications for earnings and distributional policies. Noyelle is Senior Research Scholar, Conservation of Human Resources, Columbia University. Bibliography; index.

REYNOLDS, LLOYD G.; MASTERS, STANLEY H. AND MOSER, COLLETTA H. *Economics of labor*. Englewood Cliffs, N.J.: Simon and Schuster, Prentice-Hall, 1987. Pp. x, 518. ISBN 0-13-225772-8. JEL 87-1213

Textbook on labor economics designed for a one-term upper division course for economics majors. Topics include: labor markets; labor supply decisions; human capital—education and job training; demand; investment by firms in workers; wage determination in practice; the real wage level and productivity; organization and objectives of trade unions; nonwage effects and the balance sheet; discrimination; unemployment; and American workers in a world economy. Concludes with a compari-

son of U.S. labor markets with labor markets in developed, developing, and planned economies. Contains chapter summaries, key concepts, review questions, and selected readings. Reynolds is Professor of Economics at Yale University. Masters is at the State University of New York at Binghamton. Moser is at Michigan State University. Glossary; index.

ROBINSON, DEREK. *Monetarism and the labour market*. Library of Political Economy series. Oxford; New York; Toronto and Melbourne: Oxford University Press, Clarendon Press, 1986. Pp. xiv, 499. \$49.95. ISBN 0-19-877191-6. JEL 87-1214

Critique of the monetarist treatment of labor markets. Describes monetarism, and discusses: the Quantity Theory, wages and employment; the demand and supply of money; and income and wealth. Considers different definitions of income and examines the concept of permanent or lifetime income, emphasizing the importance of fairness and beliefs about the level of future income. Examines the demand for and supply of labor, introducing the notion of acceptable labor supply. Analyzes the relationship between real wages, labor supply and unemployment, and job search, and the determination of pay and employment in a free market, introducing the role of trade unions into the analysis. Examines the relationship between inflation and unemployment; the role of expectations by individuals and if there are trade unions; the natural rate of unemployment; policies of the Thatcher government; and counter-inflationary policies. Robinson is Senior Research Officer at the Institute of Economics and Statistics, Oxford University. Bibliography; index.

SANDELL, STEVEN H., ed. *The problem isn't age: Work and older Americans*. New York and London: Praeger, 1987. Pp. xiii, 265. ISBN 0-275-92371-1. JEL 87-1215

Fifteen papers conduct an analysis of the labor market problems of older workers. Part 1 examines the demographic and economic context of prospects for older workers, and labor market problems and employment policies affecting older Americans. Part 2 deals with labor market problems and examines: explanations for the reduced pay of older job losers; age changes in productivity and earnings among managers and professionals; aging and relative earnings; older workers in the market for part-time employment; and job displacement and the employment service. Part 3 discusses policies and prospects focusing on: government employment and training programs; emerging state and local initiatives; a management perspective on work alternatives for older Ameri-

cans; private-sector employment practices; the effects of restructuring the Social Security System; health plan costs, medicare, and the employment of older workers; and retirement and participation in volunteer activities. The contributors are mainly economists. Sandell is an economist at the National Commission for Employment Policy. Selected bibliography; index.

SCHAGER, NILS HENRIK. *Unemployment, vacancy durations and wage increases: Applications of Markov processes to labour market dynamics*. IUI Research Report series, no. 29. Stockholm: Industrial Institute for Economic and Social Research; distributed by Almqvist and Wiksell, 1987. Pp. 217. SKr. 178.00, paper. ISBN 91-7204-280-X. JEL 87-1216

Analysis of the dynamics of the labor market and wage formation. Part 1 presents a reinterpretation of the curve relating the stock of unemployment to the stock of vacancies—the UV curve—and examines hires as the outcome of stochastic interaction between unemployment and vacancies. Part 2 views the optimal wage and hiring policy of a firm as a controlled Markov process. A technical supplement details the structures of Markov decision processes of an employment-expanding firm. No index.

STANDING, GUY. *Unemployment and labour market flexibility: The United Kingdom*. World Employment Programme series. Washington, D.C. and Geneva: International Labour Office, 1986. Pp. xi, 147. \$21.00, paper. ISBN 92-2-105291-5. JEL 87-1217

Reviews the trends in British unemployment and assesses the theme that increased labor market flexibility would lead to a rapid reduction of that unemployment. Concentrates on 1979-1986 when unemployment rose to the highest levels since the 1930s. Considers the pattern of unemployment that has emerged, the official explanation of that unemployment, and the actual policies pursued in recent years. Reviews policies introduced in the 1985 and 1986 budgets, focusing on the link between unemployment and labor market flexibility. Discusses the demise of full employment and the incidence of unemployment. Examines government perceptions of unemployment in the 1980s, and unemployment and labor market inflexibility. Considers special measures to aid the unemployed and discusses the emergence of flexible labor systems and how this development alters the problem. Concludes that flexibility is desirable if it means skilled and autonomous adaptability but not if it requires insecurity, instability, and controlled activity. No index.

UNITED NATIONS ECONOMIC AND SOCIAL COMMISSION FOR ASIA AND THE PACIFIC. *International labour migration and remittances between the developing ESCAP countries and the Middle East: Trends, issues and policies*. Development Papers series, no. 6. U.N. Publications Sales No. E.87.II.F.6. Bangkok: ESCAP; distributed by U.N. Sales Section, New York and Geneva, 1987. Pp. ix, 206. \$23.50, paper. ISBN 92-1-119434-2.

JEL 87-1218

Analysis of trends and major issues in the international flow of labor and remittances between ESCAP countries and the Middle East. Reviews patterns of labor and remittance flows. Examines the impact on income, balance of payments, consumption, saving, investment, prices, wages, and employment in labor exporting countries. Discusses labor recruitment and remittance procedures, and demand in labor importing countries. Reviews policy measures and options for: worker protection, the integration of returned migrants, the control of remittance flows, and cooperation among labor exporters and between exporters and importers. No index.

### 830 TRADE UNIONS; COLLECTIVE BARGAINING; LABOR-MANAGEMENT RELATIONS

FLANAGAN, ROBERT J. *Labor relations and the litigation explosion*. Washington, D.C.: Brookings Institution, 1987. Pp. x, 122. \$26.95, cloth; \$9.95, paper. ISBN 0-8157-2858-1. JEL 87-1219

Analyzes the nature, causes, and consequences of the litigation explosion that has developed under the National Labor Relations Act (NLRA). Provides an economic and statistical analysis of the effects of regulatory rule-making on labor relations behavior and on the regulatory process. Reviews the general features and implications of policy under the NLRA and examines the growth of regulatory litigation. Compares U.S. outcomes with those of Canada and Japan. Evaluates the controversy over the effect of NLRB regulations on labor relations outcomes. Analyzes the influence of compliance and enforcement incentives on the growth of unfair practice charges and considers implications of changes in national labor relations policy. Flanagan is Associate Professor of Labor Economics at the Graduate School of Business, Stanford University. Index.

HAGGARD, THOMAS AND PULLIAM, WILLIAM S. *Conflicts between labor legislation and bankruptcy law*. Labor Relations and Public Policy Series, no. 30.

Philadelphia: University of Pennsylvania, Wharton School, Industrial Research Unit, 1987. Pp. x, 278. \$27.50, paper. ISBN 0-89546-064-5.

JEL 87-1220

Comprehensive treatment of the relationship of bankruptcy law and labor legislation. Specific topics include: the rejection of collective bargaining agreements; the Supreme Court decision in *Bildisco*; the impact of Section 1113, which basically prohibits any form of unilateral modification or rejection of labor contract by a debtor; mandatory bargaining overcharges in the operation of the debtor employer's business; labor law successorship doctrine as applied to the purchaser of assets of a bankruptcy estate; bankruptcy versus NLRB jurisdiction over matters affecting the debtor's estate; bankruptcy versus arbitral jurisdiction over disputes arising under a debtor employer's collective bargaining agreement; the power of bankruptcy courts to enjoin strikes; bankruptcy status of claims for employee compensation and benefits; and the appointment of union representatives on Chapter 11 creditor committees. Haggard is a professor at the University of South Carolina Law School. Pulliam is a practicing attorney in San Diego. Index of cases.

MARSHALL, RAY. *Unheard voices: Labor and economic policy in a competitive world*. New York: Basic Books, 1987. Pp. xi, 339. \$19.95. ISBN 0-465-08869-4. JEL 87-1221

Examines the influence of worker participation on U.S. economic performance and competitiveness. Analyzes the implications of the internationalization of formerly more isolated national economies. Discusses the problems created by these changes and demonstrates the inability of traditional nonconsensus-based policies to deal with these problems. Examines the declining competitiveness of American industry because of inadequate policies, and analyzes the impact of management, collective bargaining, and worker ownership on economic performance. Demonstrates the use of consensus mechanisms for public policy making in the United States and Europe. Examines how the Japanese have used the consensus process to develop a highly competitive economic system and presents public policy recommendations for use in the United States. Marshall is Audre and Bernard Rapoport Centennial Professor of Economics and Public Affairs at the University of Texas. Bibliography; index.

PERRY, CHARLES R. *Union corporate campaigns*. Major Industrial Research Unit Studies series, no. 66. Philadelphia: University of Pennsylvania, Wharton School, Industrial Research Unit, 1987.

Pp. viii, 211. \$30.00. ISBN 0-89546-065-3.

JEL 87-1222

Objective analysis of the corporate campaign tactic of union organizing whereby secondary pressure is applied to others—stockholders, directors, financial institutions, customers, legislators, and anyone else who deals with the company—to induce them to compel company management to agree to union demands. Explains the nature of these campaigns and evaluates their successes and failures. Reviews campaigns involving BASF, Beverly Industries, Campbell Soup, Consolidated Foods (now Sara Lee), Hormel, General Dynamics, Litton Industries, Louisiana-Pacific, Phelps Dodge, and Seattle First National Bank. Six appendices provide additional material on several of these campaigns. Perry is Associate Professor of Management and Industrial Relations and Senior Faculty Research Associate in the Industrial Research Unit at the Wharton School, University of Pennsylvania. Index.

SCOTT, DANIEL T. *Technology and union survival: A study of the printing industry*. New York and London: Greenwood Press, Praeger, 1987. Pp. xix, 185. ISBN 0-275-92680-X. JEL 87-1223

Analyzes the decline in the unionization of the commercial printing industry through comparison and evaluation of historical trends in craft union membership. Examines the way in which advances in production technology introduce new forms of competition into the craft union labor market. Presents the craft union membership model as the framework for analysis. Describes the historical transformation from craft production to automated printing production, and traces the decline in craft training and the demand for craft production accompanying this transformation. Examines craft union response to technological change, and presents two case studies showing how the International Typographical Union (ITU) and the Graphics Communications International Union (GCIU) responded to the new competition. Argues that the decline in the ITU and GCIU membership between 1969 and 1983 was caused by technological skill displacement and union response to new production processes. Scott, an economist, is President of Scott Printing Company, an employer of over 200 workers. Bibliography; index.

OLLIDAY, STEVEN AND ZEITLIN, JONATHAN, eds. *The automobile industry and its workers: Between Fordism and flexibility*. New York: St. Martin's Press, 1987. Pp. viii, 335. \$45.00. ISBN 0-312-00553-9. JEL 87-1224

Thirteen essays and an introduction by the editor, based on the selected and revised proceedings of a conference held at the Lanchester Polytechnic,

Coventry, in June 1984, provide an account of the development and probable future of the automobile industry. Part 1 reviews the rise of Fordism by examining management and labor in Britain (1896-39), France (1914-39), and Italy (1906-45). Part 2 discusses industrial relations under Fordism, focusing on: an Anglo-American comparison of shop-floor bargaining, contract unionism, and job control; the rise and fall of shop-floor bargaining at Fiat, 1945-80; union strategy and shop-floor conflict in the United States, 1946-70; and industrial relations in the Japanese automobile industry, 1945-70. Part 3 looks beyond Fordism and examines: product market changes and firm strategies in the 1970s and 1980s; product and labor strategies in Japan; new production concepts in West German car plants; and recent developments in U. S. auto labor relations. Zeitlin is Lecturer in History at Birbeck College, London. Tolliday is a policy advisor at the London Strategic Policy Unit. Index.

WILLMAN, PAUL. *Technological change, collective bargaining, and industrial efficiency*. Oxford; New York; Toronto and Melbourne: Oxford University Press, Clarendon Press, 1986. Pp. xvi, 282. \$45.00. ISBN 0-19-827262-6. JEL 87-1225

Analysis of trade union reactions to innovation. Explains the origins and the incidence of trade union resistance to technical change. Discusses technological change, trade unions, and efficiency. Reviews the development of trade union policies toward new technology in the United States and the United Kingdom. Presents evidence of trade union resistance to change and examines the pattern of industrial innovation. Discusses the ways in which change is negotiated under spot contracting, focusing on the docks, automobiles, and national newspapers in the United States and the United Kingdom. Examines micro-electronics and mature industries. Reviews innovation and efficiency in the car industry and contrasts this experience with adoption of information technology in banking where there has been little conflict. Willman is a lecturer at the London Business School. Author and subject indexes.

#### 840 DEMOGRAPHIC ECONOMICS

CHESNAIS, JEAN-CLAUDE. *La transition démographique (The demographic transition)*. Collection: Institut national d'études démographiques, cahier no. 113. Paris: Presses Universitaires de France; distributed by Les Editions Françaises, Boucher-

1968

*Journal of Economic Literature*

ville, Quebec, 1986. Pp. iv, 580. Fr 150.00, Can\$ 43.65, paper. ISBN 2-7332-0113-1.

JEL 87-1226

Studies the demographic time series of sixty-seven countries, covering the 1720-1984 period. Examines the transitional theory of population dynamics as an alternative to Malthus's Law of Population. Appraises the steps of transitional demography, whereby the decline of natality is attributed to improved living conditions, in today's world economies. Different types of transition are analyzed in light of periods of industrialization and in contemporary situations. Recent economic implications of the transitional theory are reviewed in terms of economic growth, food production, and investment measures, particularly for developing nations. Chesnais is Head of the Department of Demography and Social Economy at the INED in Paris. Bibliography; name index. [Jean Mirucki]

PEDEN, JOSEPH R. AND GLAHE, FRED R., eds. *The American family and the state*. Foreword by ROBERT NISBET. Pacific Studies in Public Policy series. San Francisco: Pacific Research Institute for Public Policy, 1986. Pp. xxvi, 488. \$34.95, cloth; \$14.95, paper. ISBN 0-936488-05-0, pbk.

JEL 87-1227

Fifteen essays, and an introduction by the editors, examine crucial public policies that affect the family. Essays focus on political and economic theories of the family, the experience of the nineteenth and early twentieth centuries, the legal status of personal relationships, and the impact of current economic and social policies on family life. Specific topics include: the family and the state in modern political theory; the family and state: a theoretical framework; the progressive era and the family; education and the family during the Industrial Revolution; philosophic assumptions of some contemporary judicial doctrines; marriage, divorce, and property rights: a natural rights framework; freedom of contract and the family; the changing concept of child abuse; inflation, migration, and divorce in contemporary America; the state and adolescent sexual behavior; foster care; welfare, family cohesiveness, and out-of-wedlock births; and the family: federal policy and private alternatives. Peden is a lecturer in History, Baruch College, City University of New York. Glahe is Professor of Economics, University of Colorado. Index.

UNITED NATIONS DEPARTMENT OF INTERNATIONAL ECONOMIC AND SOCIAL AFFAIRS. *Review and appraisal of the World Population Plan of Action: 1984 report*. Population Studies series, no. 99. U.N. Publication Sales no. E.88.XIII.2. New York:

United Nations, 1986. Pp. vi, 169. Paper 93-1-151158-5. JEL 87-1228

Report of the findings of the second review appraisal of the World Population Plan of Action undertaken by the United Nations in 1977. Contains evaluations of recommendations on: (1) economic development and population, disc economic trends, food and agriculture, soci aspects of development, and natural resources the environment; (2) the role and status of wor (3) the development of population policies; (4) ulation trends, prospects, goals, and policies, sidering topics such as population growth, mor ity and mortality, reproduction and far formation, population distribution and internal gration, international migration, and popula structure; (5) the promotion of knowledge, em sizing data collection and analysis, research, tr ing, and management; (6) the role of the natk governments and international community; and the monitoring, review, and appraisal of the Wc Population Plan of Action. Annex contains rec mendations for further implementation of World Population Plan of Action. No index.

U.S. COMMITTEE FOR REFUGEES. *World refugee . vey, 1986 in review*. Washington, D.C.: Auth 1987. Pp. 80. \$6.00, paper. ISBN 0-9365-48-4. JEL 87-1229

Annual survey of the status of refugees aro the world. Consists of ten articles, world refu statistics and country reports for 1986, a direct of organizations providing information about or sistance for refugees, and a selected bibliogra of basic and recent publications pertaining to re gees. Topics of the articles include: the year review, growing negative attitudes towards asy seekers and refugees in Europe, South Africa's i ugees, the empowerment of the refugee comm nity, when refugees are victims of torture, the motion of refugee protection by Amne International, conscientious objectors as refuge Southeast Asian refugees, refugee protection Thailand, and India's response to refugees. No dex.

**900 Welfare Programs; Consumer Economics; Urban and Regional Economics**

**910 WELFARE, HEALTH, AND EDUCATION**

ASCHER, KATE. *The politics of prioritisation: C tracting out public services*. New York: St. Marti Press, 1987. Pp. xv, 293. \$35.00. ISBN 0-31 62713-0. JEL 87-1230

Analysis of the impact of the private provision of public services on private contractors, trade unions, local councils, health authorities, and the government in Britain. Discusses the geographical and political context of the debate regarding contracting out and competitive tendering. Examines the development and dimensions of Conservative policy with regard to the National Health Services (NHS), local authorities, and central departments. Reviews the implications of contracting out for the contract service industries and for trade unions. Analyzes the mechanics of competitive tendering and covers the experience with competitive tendering in the NHS and with contracting out by local authorities. Traces the causes of dissatisfaction with contracting out and discusses prospects for the future. Based on doctoral research at The London School of Economics. Ascher is a senior consultant with Harbridge House in London. Index.

AUER, LUDWIG. *Canadian hospital costs and productivity*. Ottawa: Economic Council of Canada; distributed by Supply and Services Canada, 1987. Pp. xiv, 82. \$10.75, paper. ISBN 0-660-12321-5.

JEL 87-1231

Examines the changes in the Canadian hospital sector since its services were insured under the Hospital Insurance and Diagnostic Services Act of 1957. Measures costs and productivity in the hospital sector at a detailed level and examines changes that have taken place over the years. Explores provincial variations and isolates major factors that impact on costs and productivity in hospital care. Discusses fundamental health care issues, and outlines the concepts and methods used in the study. Examines variations in the growth and levels of hospital costs and services. Concludes with a summary of the findings and a discussion of policy options available for curbing the excessive growth of health care costs. Auer is a Senior Economist, Economic Council of Canada. Bibliography; no index.

BERKOWITZ, EDWARD D., ed. *Social Security after fifty: Successes and failures*. Studies in Social Welfare Policies and Programs series, no. 5. New York and London: Greenwood Press, 1987. Pp. viii, 168. \$29.95. ISBN 0-313-25542-3. JEL 87-1232

Seven essays, by economists, historians, political scientists, and public policy practitioners, provide an interdisciplinary analysis of the Social Security Program. In his introductory essay, the editor describes the development of the concept of social security and traces the changing philosophy about financing the program. Two contributions, by Mark H. Liff and the editor, concentrate on the history of the program and its reception by historians, emphasizing its early difficulties and how past actions

have contributed to the current program. Henry J. Aaron and Lawrence H. Thompson present the changing views of American economists toward the program. Martha Derthick examines the problems and prospects of the program, emphasizing the recent administrative problems, and W. Andrew Achenbaum examines the future of the program. The volume closes with an alternative reflection of the future by Wilbur J. Cohen and a reply by Robert J. Myers, both of whom were architects of the original program. Berkowitz is Associate Professor of History and Director of the Program in History and Public Policy at George Washington University. Index.

ECONOMIC COUNCIL OF CANADA. *Aging with limited health resources: Proceedings of a colloquium on health care, May 1986*. Ottawa: Supply and Services Canada, Canadian Government Publishing Centre, 1987. Pp. vi, 233. \$11.95, paper. ISBN 0-660-12322-3. JEL 87-1233

Twenty papers and the text of the floor discussion presented at a colloquium on health care held in Winnipeg in May 1986. Papers focus on: the international perspective on health care problems and solutions; demand and supply of health care services; alternative modes of health care delivery; advances in preventive care; health care cost control; advances in medical technology; economic limits and bioethics; and Canada's future health care program. The contributors are mainly economists and health care professionals. Bibliography; no index.

EDIRISINGHE, NEVILLE. *The food stamp scheme in Sri Lanka: Costs, benefits, and options for modification*. Research Report series, no. 58. Washington, D.C.: International Food Policy Research Center, 1987. Pp. 85. Paper. ISBN 0-89629-050-X. JEL 87-1234

Examines the food stamp scheme instituted in Sri Lanka in 1979 and its performance as a replacement for the previous food subsidy scheme; assesses its costs and benefits and provides some guidelines for modifying the program within the framework of the economic policy reforms of the late 1970s. Compares price subsidy and food stamp benefits and discusses their beneficiaries, the effect on fiscal costs and income distribution, and patterns of food consumption and nutrition. Also considers inflation and the real value of food stamps, the impact of food stamps on nutrition and cost-effectiveness, and the nutrition of children and income transfers. Major findings are that there has been a deterioration in the nutritional welfare of households in the lowest segment of the income distribution and that a well-intended income trans-

fer scheme has not been able to mitigate the effect of inflation on these households. Edirisinghe is Research Fellow, International Food Policy Research Institute, Washington, D.C. Bibliography; no index.

FLEMING, GRETCHEN V. AND ANDERSEN, RONALD M., eds. *The municipal health services program: Can access be improved while controlling costs?* Research Series, no. 34. Chicago: Pluribus Press for the University of Chicago Center for Health Administration Studies, 1986. Pp. xvii, 343. \$27.95, paper. ISBN 0-931028-84-1. JEL 87-1235

Evaluates the impact of the Municipal Health Services Program on access to and expenditures for health services in central city areas; the central question of the study is whether the program improved access while controlling expenditures. Analyzes where the program was successful in serving the urban population and where improvements on the model are desirable. Ten papers discuss inner city health care, the program evaluation data and methods, success in reaching the communities and people targeted for service, selection effects, use of medical care services, expenditures for medical care, waiver effects, and appropriateness of care. A general conclusion is that the program seems to be providing care to relatively disadvantaged segments of urban populations at a cost not greater than similar people are experiencing in other medical settings. Methodological and statistical appendices. Fleming is Director of Research and Development, American Academy of Pediatrics. Andersen is Professor and Director of the Center for Health Administration Studies and Graduate Program in Health Administration, University of Chicago. No index.

HARTMANN, HEIDI I.; KRAUT, ROBERT E. AND TILLY, LOUISE A., eds. *Computer chips and paper clips: Technology and women's employment. Volume 1.* Washington, D.C.: National Academy Press, 1986. Pp. xvii, 216. \$19.95, paper. ISBN 0-309-03688-7. JEL 87-1236

Report of the National Research Council, Commission on Behavioral and Social Sciences and Education, Committee on Women's Employment and Related Social Issues, Panel on Technology and Women's Employment. Identifies and analyzes the effects of technological change on both the quantity and quality of women's paid employment. Focuses on innovations in information processing and telecommunications and their applications in offices in the past, present, and future. Determines: if and how women are differentially affected by these innovations relative to men; the extent to which women of different ages, educational backgrounds,

and race and ethnic groups may be differently affected; and what factors may be shaping these effects. Covers: historical patterns of technological change regarding jobs of telephone operators, workers in the printing and publishing industries, information and data processors, retail clerks, and nurses; effects of technological change on the levels of employment and the structure of occupations; and the effects on employment quality and job content changes in terms of autonomy, responsibility, and knowledge. Makes recommendations to facilitate the mutual adaptation of technology and employment. Volume 2 will include case studies and policy perspectives. Hartmann is Study Director, Committee on Women's Employment and Related Social Issues, the Panel on Technology and Women's Employment, and the Panel on Pay Equity Research, National Research Council, Washington, D.C. Kraut is a Social Psychologist, Bell Communications Research. Tilly is Professor of History and Sociology, New School for Social Research. Index.

HAVEMAN, ROBERT H. *Poverty policy and poverty research: The Great Society and the social sciences.* Madison, Wis.: University of Wisconsin Press, 1987. Pp. xi, 307. \$37.50. ISBN 0-299-11150-4. JEL 87-1237

Describes and assesses the major social science research effort stimulated by the war on poverty instituted in 1965 by the Johnson administration. Provides an overview of public policy and poverty research. Discusses poverty research and its contribution to knowledge, focusing on: the measurement of economic well-being, poverty, and inequality; the analysis of public income support policy and its effects; social mobility, status attainment, and income dynamics; and disentangling the processes of education and training, segregation and discrimination, and labor market operation. Examines poverty research and social science methods and reviews: policy analysis and evaluation research; social policy experimentation; methods for correcting selectivity bias; and microdata simulation models for evaluating public policy. Haveman is John Bascom Professor of Economics at the University of Wisconsin, Madison. Index.

JOEKES, SUSAN P. *Women in the world economy.* IN-STRAY Study series. New York; Oxford; Toronto and Melbourne: Oxford University Press, 1987. Pp. xii, 161. \$19.95. ISBN 0-19-504947-0. JEL 87-1238

Analysis of the impact of developments in the world economy upon the role and status of women. Part 1 discusses methodological issues and traces the changing position of women in terms of health

and education, economic activity, and certain macro- and micro-economic factors. Part 2 assesses the impact of international trade and finance and technological change on the status of women. Part 3 discusses employment trends for women in the agricultural, industrial, and service sectors. Part 4 summarizes the findings regarding the impact of emerging trends in the international economy on women and proposes an agenda for innovative development policies aimed at improving the status of women. Joeke is associated with the Institute of Development Studies at the University of Sussex. Bibliography; index.

MEYER, JACK A. AND LEWIN, MARION EIN, eds. *Charting the future of health care: Policy, politics and public health*. AEI Studies series, no. 449. Washington, D.C.: American Enterprise Institute for Public Policy Research; distributed by UPA, Lanham, Md., 1987. Pp. ix, 190. \$24.50, cloth; \$12.75, paper. ISBN 0-8447-3611-2, pbk.

JEL 87-1239

Nine essays analyze the important trends in the health care sector and their implications for the future. Three essays discuss the implications for health care of the current federal budget environment, describing: the fiscal conditions, cutting costs, budget cutbacks, the future of health care financing, reforming physical reimbursements under Medicare, and the experience in California of selective contracting for health care services. Two essays address the future, from the perspective of the roles of professionals and technological change, dealing with health trends and their implications for the health care professions, alternatives for the future of the health care system, and medical technology in a changing health care environment. Four essays are concerned with improving health status, including individual behavior, workplace reforms, public health issues, cost-effectiveness analysis, wellness approach, the AIDS concerns, health care and economic self-sufficiency, and health care and low income. Meyer is President and Founder of New Directions for Policy, a research firm studying welfare and health care issues. Lewin is Director of AEI's Center for Health Policy Research. No index.

RUSSELL, LOUISE B. *Evaluating preventive care: Report on a workshop*. Studies in Social Economics series. Washington, D.C.: Brookings Institution, 1987. Pp. x, 107. \$22.95, cloth; \$8.95, paper. ISBN 0-8157-7626-8.

JEL 87-1240

Summary of the proceedings of a workshop held at the Brookings Institution in May 1986 to assess the potential of prevention for improving the health of older people. Examines a cost-effective-

ness model of health effects in the case of hypertension and discusses how to translate health effects into work capacity. Reviews the health effects, interventions, and cost-effectiveness analysis of smoking, exercise, dietary calcium, alcohol use, and obesity. Russell is a senior fellow in the Brookings Economic Studies program. Bibliography; index.

SCHRAMM, CARL J., ed. *Health care and its costs*. American Assembly, Columbia University, series. New York and London: Norton, 1987. Pp. x, 301. Paper. ISBN 0-393-95671-7. JEL 87-1241

Contains background papers used by participants at a meeting of the American Assembly at Arden House in November 1986. Illuminates the importance of problems associated with health care delivery and finance. Papers examine the structure and financing of the current health care delivery system; public opinion and health care costs; changes in U.S. health care over the last twenty years; risk-bearing in health care finance; the changing role of the physician; the interaction of population aging and health transitions at later ages; long-term care; and health care technology and policy. Schramm is Director of the Johns Hopkins Center for Hospital Finance and Management and Associate Professor in the School of Hygiene and Public Health at Johns Hopkins University. Index.

SMOLLAN, ROY, ed. *Black advancement in the South African economy*. New York: St. Martin's Press, 1986. Pp. 256. \$35.00. ISBN 0-312-08253-3.

JEL 87-1242

Seventeen papers that examine factors affecting the economic advancement of the black population in South Africa, with emphasis on the selection and development of human resources by South African organizations to achieve corporate objectives in a fair and just manner. Topics include the history of Black involvement in the South African economy; the growth of Black business in South Africa; the role of Black women in the economy; the trade unions and Black advancement; educational, economic, organizational and social, and legal obstacles to Black advancement; the roles of the state, private sector, and nonprofit organizations in education and training; planning and implementing advancement programs; identifying Black management potential; training needs and techniques; and case studies of experiences with programs at SA Cyanamid, Barclays National Bank, and Rand mines. Contributors are mainly economists, businessmen, sociologists, and educational specialists. Smollan is Lecturer in Management, Mangosuthu Technikon, Umlazi, KwaZulu, South Africa. Bibliography; index.

STEIDLMEIER, PAUL. *The paradox of poverty: A reappraisal of economic development policy*. Business in a Global Environment series. Cambridge, Mass.: Harper and Row, Ballinger, 1987. Pp. xx, 318. \$29.95. ISBN 0-88730-184-3.

JEL 87-1243

Examines the paradox of persistent, and even growing, poverty and hunger amid progress and economic growth. Part 1 examines the structure of the problem and elements of the diagnostic method. Part 2 provides a social analysis of development, and considers: population, resources, and scarcity; the promise of technology; power and social organization; and cultural paradigms. Part 3 discusses development as social change and focuses on domestic and international development policies. Steidlmeier teaches at the School of Management, State University of New York, Binghamton. Author and subject indexes.

WORLD HEALTH ORGANIZATION. *Intersectoral action for health: The role of intersectoral cooperation in national strategies for health for all*. Geneva: World Health Organization, 1986. Pp. 152. \$14.00, paper. ISBN 92-4-156-096-7.

JEL 87-1244

Recommendations of the 39th World Health Assembly held in May 1986 and the background document used for technical discussions. Examines what intersectoral collaboration as a national health strategy entails in terms of its practical implementation and how it can be used to improve the health status of populations. Focuses on four areas: equity and health; agriculture, food, and nutrition; education, culture, information, and life patterns; and environment, water and sanitation, habitat, and industry. Also considers how to avoid or mitigate health risks associated with industrialization and development, and issues related to the place of health in resource allocation and adjustment policy. Bibliography; no index.

## 920 CONSUMER ECONOMICS

RAUNIKAR, ROBERT AND HUANG, CHUNG-LIANG, eds. *Food demand analysis: Problems, issues, and empirical evidence*. Ames: Iowa State University Press, 1987. Pp. xvi, 285. \$23.95. ISBN 0-8138-1841-9.

JEL 87-1245

Thirteen studies review the theoretical framework for demand analysis and discuss applications and interpretations of complete and partial demand systems. Part 1 presents concepts of consumer de-

mand theory, reviews data sources for demand analyses, and discusses examples of data problems in demand analyses. Part 2 examines the use of complete demand systems for the analysis of consumer behavior regarding various food and nonfood items. Part 3 discusses partial systems of demand equations with a commodity emphasis, and socioeconomic, demographic, and psychological variables in demand analyses. Part 4 examines policy issues affecting nutrition, focusing on: consumer demand for nutrients in food; food consumption and nutrient intake patterns of school-age children; and the impact of the food stamp program on food expenditures and diet. The contributors are mainly economists. Raunika is Professor of Agricultural Economics and Huang is Associate Professor of Agricultural Economics, both at the University of Georgia's Agricultural Experiment Station at Griffin. Index.

VISCUSI, W. KIP AND MAGAT, WESLEY A. *Learning about risk: Consumer and worker responses to hazard information*. With JOEL HUBER ET AL. Cambridge, Mass. and London: Harvard University Press, 1987. Pp. viii, 197. \$27.50. ISBN 0-674-51915-9.

JEL 87-1246

Seven contributors, drawing on work in economics, decision science, marketing, and psychology, present new evidence on how people process information about risk and how they make choices under uncertainty. Examines information processing and individual decisions, and cognitive considerations in presenting risk information. Discusses the design of a consumer information study to discover the effects of labeling potentially hazardous products and uses the responses of the survey to analyze how the content and format of the information on product labels affect the precautionary behavior of consumers who use them. Examines the effect of changes in product risk on the price consumers are willing to pay for it and discusses a field study of the effect of hazard warnings in the workplace in the chemical industry. Concludes with a discussion of implications for economic behavior. Viscusi is Professor of Economics at Northwestern University. Magat is Associate Professor at the Fuqua School of Business, Duke University. Index.

## 930 URBAN ECONOMICS

BURNS, LELAND S. AND GRESLER, LEO. *The future of housing markets: A new appraisal*. Environment, Development, and Public Policy—Cities and Development series. New York and London:

Plenum Press, 1986. Pp. ix, 200. \$29.50. ISBN 0-306-42313-8. JEL 87-1247

Examines the future of the housing market, focusing on those changes in the prospective housing demand that are shaped by demographic and emergent social forces. Relies on data from the U.S. Bureau of the Census and the authors' study of demographic trends and projections. Traces the changing demographic conditions for housing demand in detail and reviews socioeconomic trends affecting household formations. Describes the relation between age and housing demand and examines demand changes and supply responses for housing in the future. Concludes that the trend toward higher quality housing will continue and that there will be an increase in the transfer of economic activities from the workplace to the residence. Burns and Grebler are with the University of California at Los Angeles. Index.

MOHAN, RAKESH. *Work, wages, and welfare in a developing metropolis: Consequences of growth in Bogotá, Columbia*. New York; Oxford; Toronto and Melbourne: Oxford University Press for the World Bank, 1986. Pp. xi, 403. \$29.95. ISBN 0-19-520540-5. JEL 87-1248

Studies the determination of labor income in urban areas in the context of rapid urban and economic growth using data collected from 1977 to 1980 and then 1984 in two cities, Bogotá and Cali, Colombia. Presents the spatial distribution, income distribution, and extent and distribution of poverty characteristics in Bogotá and Cali. Part 2 examines the characteristics of the urban labor market in Bogotá that help explain some of its population characteristics. Specific topics include: labor force characteristics, determinants of labor force participation and labor earnings, labor market segmentation, and estimating earnings functions for women. The final chapter summarizes the main findings of the study, relates them to the overall economic environment in Colombia, and assesses their relevance to understanding the growth processes of large cities. Concludes that high urban unemployment, long-run employment problems, high poverty, and segmented labor markets need not accompany rapid urban growth. Mohan is Economic Advisor, Planning Commission, Government of India. Index.

SCOTT, TERRENCE J. AND MAZIARKA, ROBERT F. *Elderly housing options*. Chicago: Pluribus Press, 1987. Pp. 235. \$39.95. ISBN 0-931098-87-6. JEL 87-1249

A guide to the housing market for the elderly. Discusses the evolution and potential of hospital involvement and interest in Congregate Housing

with Services for the Elderly (CHSE). Reviews the history of life care and CHSE. Outlines the procedures for determining market feasibility and selecting the appropriate service package and rental rates for CHSEs. Discusses financial feasibility and project costs, and methods of long-term financing and sources of equity. Analyzes alternative roles for health care organizations. Discusses project development and working with developers and outside investors. Examines issues and challenges from a chief executive officer's and planner's perspective. Scott is President and Maziarka is Executive Vice President, Elderly Management Corporation, Inc. Index.

#### 940 REGIONAL ECONOMICS

BOOTH, DOUGLAS E. *Regional long waves, uneven growth, and the cooperative alternative*. New York and London: Greenwood Press, Praeger, 1987. Pp. v, 121. \$32.95. ISBN 0-275-92567-6. JEL 87-1250

Presents a theoretical explanation of uneven regional growth in the United States in terms of long waves and details historical evidence in support of this thesis. Contends that a cooperative alternative is necessary during regional slow growth periods and outlines the theoretical support for the superior results accruing from cooperative ownership and control of the means of production. Documents the experience of worker cooperatives and examines methods of fostering regional development through the creation of a cooperative economic sector. Booth is Assistant Professor of Economics at Marquette University. Bibliography; index.

BURGHARDT, STEVE AND FABRICANT, MICHAEL. *Working under the safety net: Policy and practice with the new American poor*. Sage Human Services Guides series, no. 47. Newbury Park, Calif.; London and New Delhi: Sage Publications in cooperation with the University of Michigan School of Social Work, 1987. Pp. 180. Paper. ISBN 0-8039-2700-2. JEL 87-1251

Analysis of the nature and extent of American poverty. Reviews the various forms of intervention devised to alleviate poverty and critically assesses the welfare state and its policies. Examines the recent intensification of poverty. Evaluates the status of the homeless, the hungry, the aged, black single-parent women, the physically disabled, and the new unemployed. Outlines new organizational and practice directions for eliminating poverty. Burghardt and Fabricant are Associate Professors of Urban Policy and Research, Hunter College School of Social Work, New York.

LANE, THEODORE, ed. *Developing America's northern frontier*. Lanham, Md. and London: University Press of America, 1987. Pp. xx, 249. \$26.50, cloth; \$13.75, paper. ISBN 0-8191-8082-2, pbk.

JEL 87-1252

Ten papers, two previously published, present American and Canadian perspectives on issues relating to the economic development of the arctic and subarctic North. Part 1 focuses on the prospect of northern development without oil. Papers examine Alaskan policies toward commercial fisheries and review the Canadian North's potential development of energy and other resources. Part 2 deals with the North's adaptation to economic development. Papers analyze import substitution in frontier regions; the labor force status of Alaska's native population; and the impact of economic development on native culture. Part 3 examines local governance and attempts at Canadian land-use planning as well as the Alaska Native Claims Settlement Act. Part 4 analyzes the consequences of development for the northern people and assesses the impact on communities, transient work forces, and the legal process. Lane is Adjunct Professor of Economics at the University of Alaska, Anchorage. No index.

[LÖSCH, AUGUST.] *Space-structure-economy: A tribute to August Lösch*. Edited by ROLF H. FUNCK AND ANTONI KUKLINSKI. Karlsruhe Papers in Economic Policy Research series, vol. 3. Karlsruhe, West Germany: von Loeper; distributed in the United States and Canada by Kober Press, San Francisco, 1986. Pp. vii, 311. Paper. ISBN 3-88652-680-1.

JEL 87-1253

Nineteen essays collected to honor August Lösch. Part 1 considers Lösch's contributions and evaluates them according to the criteria of his own time. Appraises his contributions to the classical theory of location and the beginnings of a general theory of socio-economic development in space. Presents a review of his contributions to other areas of economic research such as the impact of demographic developments on growth, the theory of transfer, and the theory of trade. Emphasizes his contributions to the concept of region and reviews his impact in Poland, the U.S.S.R., and Japan. Part 2 is devoted to the extensions of Lösch's concepts and research based on his foundations, covering: market areas; technologically induced dynamic changes; spatial regularities in India; the centrality and location of urban places for a region's economic performance; the impact of language differences on spatial interaction; and aspects of nonprofit enterprises in the Löschian spatial framework. Part 3 presents a more personal perspective about Lösch. Funck is with the Institut für Wirtschaft-

spolitik und Wirtschaftsforschung, University of Karlsruhe. Kuklinski is with the Institute of Socio-economic and Regional Geography, University of Warsaw. No index.

PERRYMAN, M. RAY AND SCHMIDT, JAMES R., eds. *Regional econometric modeling*. International Series in Economic Modeling. Norwell, Mass.; Dordrecht and Lancaster: Kluwer Academic, Kluwer-Nijhoff, 1986. Pp. xv, 254. \$49.95. ISBN 0-89838-216-5.

JEL 87-1254

Nine papers summarize current methodological, external linkage, and data and model evaluation issues and procedures in applied modeling related to regional economics and its subfields. Topics include: extensions and refinements of Peter Gottschalk's (1978) estimation of production functions; the theoretical specification, nature of variables, and usefulness of regional econometric models and the New Jersey state model; the design and use of integrated state-substate econometric models for long-run economic analysis; linking regional economic models for policy analysis with special reference to the NRIES II and RIMS II regional modeling systems; a theoretical exposition of the sensitivity of the regional business cycle with time series, cross-sectional, and predictive applications; a method for analyzing the changing impact of the business cycle on regional economics; a general framework for interpolation, distribution, and extrapolation of a time series by a related series; techniques for determining if a time series can be seasonally adjusted reliably; and an analysis of the forecasting accuracy of regional econometric models. Perryman is Herman Brown Professor of Economics and Director of the Center for the Advancement of Economic Analysis, Baylor University. Schmidt is Associate Professor of Economics, University of Nebraska. Index.

#### RELATED DISCIPLINES

COX, GARY W. *The efficient secret: The cabinet and the development of political parties in Victorian England*. Political Economy of Institutions and Decisions series. Cambridge; New York and Melbourne: Cambridge University Press, 1987. Pp. xiv, 187. \$32.50. ISBN 0-521-32779-2.

JEL 87-1255

Analysis of the institutional changes in parliamentary government in nineteenth-century England. Reviews key political and economic events. Presents evidence for increased party voting in Parliament and critiques prior explanations of this trend. Traces the rise of the cabinet as the primary

legislative and executive power, and the simultaneous changes in the procedure of the House of Commons. Evaluates the impact of the increased importance of the Cabinet on voting behavior in Parliament and in the constituencies during the latter half of the nineteenth century. Examines the development, causes, and consequences of a party-oriented electorate. Assesses the influence of constituents in Victorian England and outlines the history of party voting. Cox is Associate Professor of Government at the University of Texas at Austin. Author and subject indexes.

PENCER, SAMIA I., ed. *Foreign languages and international trade: A global perspective*. Athens, Georgia and London: University of Georgia Press, 1987. Pp. xxiv, 255. \$30.00. ISBN 0-8203-0822-6.

JEL 87-1256

Twenty-seven papers examine the importance of the study of foreign languages for the future of the U.S. economy and the continued health of the world trade community. Papers focus on: foreign languages and international trade; a working partnership; international trade in the United States; foreign languages and cultural awareness; teaching foreign languages and business skills; foreign languages and careers; and international schools and international programs. Contributors are foreign language scholars, educators, government officials, and business professionals. Spencer is Professor of French and Director of Graduate Studies at Auburn University. No index.

THOMPSON, DENNIS L. AND RONEN, DOV, eds. *Ethnicity, politics, and development*. David M. Kennedy Center for International Studies monograph series, vol. 2. Boulder, Colo.: Lynne Rienner, 1986. Pp. x, 222. \$22.50. ISBN 0-931477-57-3.

JEL 87-1257

Ten selected essays and an introduction by Dov Ronen resulting from a conference on economic and social development in multi-ethnic states by the International Political Science Association Committee on Politics and Ethnicity held at the University of Glasgow, in August 1984. Papers discuss: ethnic bargaining; a framework for comparative analysis of ethnic politics and public policy in Western societies; a hegemonial exchange model for managing conflict in Middle Africa; a conceptual reformulation of ethnic politics in Nigeria; state creation and ethnicity in a federal (plural) system and Nigeria's search for parity; development strategies and patterns of ethnicity in Africa; communal and political identities and mobilization among the Lebanese Shi'a from 1975-85; the Iranian revolution as a crisis of social science theory; and a case study of system breakdown in the Punjab. Thomp-

son is Professor of Political Science, Brigham Young University. Ronen is Director, Africa Research Program, Center for International Affairs, Harvard University. Index.

#### NEW JOURNALS

##### *Asian Economies*

Quarterly journal of the Research Institute of Asian Economies. No. 60 (March 1987) includes articles on: the Hong Kong approach to using scenarios as a tool of long-range economic planning; social and economics aspects of farm mechanization in South Korea; monetarist perspectives of Papua New Guinea's hard currency strategy; and macroeconomic policy, deficits and foreign debt problems for developing countries. Annual subscription: \$24.00 plus overseas postage of \$6.00 per year. Write to: Research Institute of Asian Economies, 132-3, Sungbookdong, Sungbook-Ku, Seoul, South Korea. (ISSN 0304-280X.)

##### *Economia Politica*

A journal of economic theory and analysis published three times a year by Società editrice il Mulino, Bologna. Volume 3, issue no. 1 (April 1986) includes one article in English on a more "General Theory" and six articles in Italian (with English summaries) on: fixed capital as a "species" of joint production, the real rate of interest with perfectly expected inflation, the compatibility of the Pareto principles with personal liberty, the transaction demand for credit and money, a recent reconstruction of the History of Economic Thought, and new developments in the study of technical progress. Also includes an introductory essay on the "marriage" of neo-Ricardian and neoclassical economics and a book review section. Annual subscription: L 40.000 (Italy), L 80.000 (elsewhere), L 110.000 (air-mail). Write to: Società editrice il Mulino, Via S. Stefano 6, 40125 Bologna, Italy.

##### *Environment and Planning C: Government and Policy*

Published quarterly by Pion Limited, London. Vol. 4, no. 4 (November 1986) contains papers on the themes of development in intergovernmental fiscal centralization and decentralization, and urban economic development and intergovernmental relations. Also includes a guest editorial, an article on organizing government for regional development, and book reviews. Annual subscription: \$90.00 including air delivery. Single copy: \$27.00. Special rates are available if ordered with A, B, or D series. United Kingdom and personal subscription rates are available on request. Write to: Pion Limited, 207 Brondesbury Park, London NW2 5JN, England. (ISSN 0263-774X.)

*Estudios de Economía*

Biannual publication (in Spanish with English summaries) published by the Department of Economics of the University of Chile, favoring empirical papers on the Chilean economy and Latin American countries in general. Vol. 13, no. 2 (December 1986) contains articles on: nominal interest rates and inflation; sources of structural change in the Chilean industrial sector; labor market segmentation in Chile; an option theory analysis of deposit insurance and incentives to risk taking; and a cross-country analysis of wage and non-wage regulations of labor market institutions. Write to: Unidad de Publicaciones, Departamento de Economía, Universidad de Chile, Diagonal Paraguay 257, torre 26 (oficina 1402) Casilla 3861, Santiago-Chile.

*Gestion 2000—Management and Perspective*

Published six times a year by the I.A.G.—School of Management of the Catholic University of Louvain, this bilingual journal (French-English) emphasizes management practices and the development of innovative ideas or experiences. Issue no. 6 (1986) contains six articles on money in private life and seven articles (one in English) on money in professional life. Most issues include descriptions and evaluations. Annual subscriptions: FB 5,000; single copies: FB 1,000. Write to: *Gestion*, Avenue de l'Espinet, 16, B-1348 Louvain-la-Neuve, Belgium. (ISSN 0773-0543)

*International Journal of Technology Management*

Published quarterly (in English with French, German, and Japanese summaries) by Inderscience Enterprises Ltd. with the assistance and cooperation of the United Nations Education, Scientific and Cultural Organization. Vol. 1, no. 3/4 (1986) contains articles on priorities in Spain's R&D system; government policy on science, research and technology in the German Federal Government and the Republic of China; prospects for collaboration and a common industrial policy in Europe for high tech industries; the dynamics of change; internationalization and localization; the "informationization" of industry and society; engineering design for profit; the role of design in the management of technology; the world car concept and the volume manufacturer; the design of competitive manufacturing system; the implications of advanced manufacturing technologies for marketing strategy; European view of the Japanese approach to productivity and quality; technological development and competition; modeling the diffusion of innovations; a comparative analysis of U.S. and U.K. experience in technology transfer; the technical role in competition analysis; and the history

and benefits of the Kitemark. Regular departments include briefs, conference reports, book reviews, commentaries, and the economic outlook for the United States, Europe, and the Far East. Annual subscription: \$120.00. Write to: Inderscience Enterprises Ltd., Order Department, World Trade Centre Building, 110 Avenue Louis Casal, Case Postale 306, Ch 1215 Geneva-Aéroport, Switzerland. (ISSN 0267-5730)

*The Journal of Agricultural Economics Research*

Quarterly publication of the Economic Research Service, U.S. Department of Agriculture. Vol. 39, no. 2 (Spring 1987) contains articles on: trade and agricultural research; arbitrage conditions, interest rates, and commodity prices; U.S. grain exports and the value of the dollar; contrasting agricultural commodity data; and economic impacts on consumers, growers, and processors resulting from mechanical tomato harvesting in California. Several book reviews appear in each issue. Annual subscription \$5.00, U.S.; \$6.25, foreign. Write to: Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

*Journal of Economic Surveys*

Published biannually by Tieto Ltd., of Avon, England, to present surveys of recent contributions and developments across the broad spectrum of economics. Vol. 1, no. 1 (1987) contains articles on: econometric methodologies; economic reform in Eastern Europe; and recent developments in the theory of natural monopoly. Reviews computer software, books, and conferences in each issue. Annual subscription: £15.00 U.K., \$29.00 U.S. (libraries and institutions); £6.00 U.K., \$12.00 U.S. (individuals); and £4.00 U.K., \$8.00 U.S. (students). Rates based on two issues in 1987; four will be published in 1988. Write to Tieto Ltd., Bank House, 8A Hill Road, Clevedon, Avon BS21 7HH, England. (ISSN 0950-0804)

*The Kashmir Economic Review*

Bi-annual publication of the Department of Economics, University of Azad Jammu and Kashmir, Pakistan. Volume 2, no. 1 (January-June 1985) presents articles on growth, inflationary finance, and the transition path to equilibrium; poverty in Pakistan; a generalization of the customs union vs. unilateral tariff reduction analysis; intersectoral differentials and distribution of income in Pakistan; and a book review. Annual subscription: \$12.00 (\$20.00, air mail). Single issue \$8.00 (\$12.00 air mail). Write to: *The Kashmir Economic Review*, Department of Economics, University of Azad Jammu and Kashmir, Muzaffarabad (AK), Pakistan.

*Midsouth Journal of Economics and Finance*

Published jointly by: the Midsouth Academy of Economics and Finance; the Department of Economics, Finance, and Applied Legal Studies of the Mississippi State University; and the Department of Economics of the Memphis State University. Formerly titled the *Midsouth Journal of Economics*. Vol. 10, no. 3 (December 1986) includes articles on: the perceived effect of risk by employers on earnings of parolees; a time-series analysis of political monitoring in the production of high-powered money; industry structure, price changes, and capacity utilization; a programming model for internal migration in less-developed regions; labor supply and the nonpecuniary characteristics of employment; an empirical examination of economic factors used in direct foreign-investment decisions; reformation of China's banking system; stock prices and the money supply; the stability of tastes in alternative theories of consumer choice; and a computer simulation model for evaluating alternative macroeconomic systems. For subscription information, write to: *Midsouth Journal of Economics and Finance*, Department of Economics, Memphis State University, Memphis, Tennessee 38152.

*The Practical Accountant*

Published monthly by Warren, Gorham 050 Lamont, Inc. of Boston. Vol. 20, no. 6 (June 1987) contains features on: how to handle the tax aspects of bankruptcy for individuals; a checklist for tax-saving opportunities under the 1986 Tax Reform Act; how to use Statement on Auditing Standards no. 50; the interest deduction for individuals after tax reform; how to market financial planning services profitably; nine ways to coordinate more effectively with attorneys in tax disputes; and the CPA-physician relationship. Regular departments focus on: the accountant's tax alerts; inside the IRS;

accounting and auditing report; the accountant's image; tax blunders; personal financial planning; computers; practice management; book reviews; and classified advertising. Annual subscription \$54.00, U.S.; \$79.00, foreign. Write to: Warren, Gorham 050 Lamont, Inc., 210 South Street, Boston, MA 02111. (ISSN 0032-6321)

*Review and Perspective*

Published quarterly by the Center for Business and Economic Research of the College of Business and Economics, University of Kentucky. Addresses business, economic, and public policy issues related to Kentucky. Vol. 11, no. 1 (Spring 1987) contains articles on: transitions in banking; the economic impact of Toyota on Kentucky; and the socio-economic impact of Toyota on Scott County. Regular features include selected indicators of economic activity and sections containing information, news, and current publications. No charge for subscription. Write to: *Review and Perspective*, Center for Business and Economic Research, 301 Mathews Building, University of Kentucky, Lexington, 40506-0047. (ISSN 0270-1421)

*Rivista Milanese di Economia*

Quarterly Italian language journal published by Cassa di Risparmio, Lombarda. The January-March 1987 issue (no. 27) contains four articles on: Marxism and Pareto, the evolution of the Italian monetary system; the immovable market, and foreign trade at the subnational level. Also includes seven regular departments concerning: dimensions of the economy, conjectural and sociological observations, views from the university, articles on finance and industry, historical research, and book reviews and notes. For information, write to: Cassa di Risparmio, Via Filodrammatici, 3, 20121 Milan, Italy.

## Editor's Note

The following persons assisted the editors in annotating these books: Mrs. Joan Daley and Dr. Vibha Kapuria-Foreman and Professor Reuben E. Slesinger (both of the University of Pittsburgh).

The articles appearing in the Subject Index were classified under the direction of Professor Asatoshi Maeshiro, Editorial Consultant, assisted by Mr. A'Amer Farooqi, Mr. Nayyer Hussain, Mr. Edgar L. Zamalloa, and Mrs. Lorena M. Zamalloa (all of the University of Pittsburgh).

# Contents of Current Periodicals

Abstracts of articles marked thus ● appear in this issue. See the *Index of Authors of Articles in the Subject Index* for page numbers, in *italics*.

## **Acta Oeconomica, Vol. 35, No. 1-2, 1985**

- Csáki, C. An Outlook of Food Supply and Demand in the CMEA Countries: Results of the IIASA/FAP Model System.

# Selected Abstracts

## Editor's Note

These abstracts are prepared by the author of each article. Each journal editor, where we have an abstracting agreement, is responsible for instructing the author according to our style sheet. These editors are responsible, additionally, for sending these abstracts to the *Journal of Economic Literature*. Only a minimal amount of copy editing is done on these abstracts; thus the reader should turn to the author of the abstract and not this journal if an error of fact or phrasing arises.

NOTE: The limit of 100 words for abstracts is being *strictly enforced*; i.e., longer abstracts are not printed.

## 000 General Economics; Theory; History; Systems

### 010 GENERAL ECONOMICS

#### 011 General Economics

Buchanan, James M. and Tollison, Robert D.—A Theory of Truth in Autobiography

The "truth" in autobiography depends on the observable historical record of a person's life. The less attractive the observed life, the more "truthful" is the autobiography. This result does not require differential standards of honesty as among autobiographers. It does depend on the presupposition that there exists a common value scale along which lives may be judged, and upon the common directional bias toward the "good" in all autobiography. *Kyklos*, 1986, 39(4), pp. 507-17. George Mason University.

Etzioni, Amitai—Toward a Kantian Socio-economics

Recent criticisms of utilitarianism have given new importance to Kantian philosophy and ethics. In the Kantian tradition, this paper argues for replacing the neoclassical with a socioeconomic paradigm drawing on other social science disciplines. Central to the socioeconomic paradigm are the use of a bi-utility conception, emphasizing both pleasure and morality, rather than one overarching utility and the acknowledgement of the need to study preference formation. This paper concludes with a call to end the intrusion of the excessively parsimonious

neoclassical paradigm into the other social sciences, and instead for economics to use the knowledge accumulated in other social sciences. *Rev. Soc. Econ.*, Apr. 1987, 45(1), pp. 37-47. George Washington University.

Gottfries, Nils and Hylton, Keith—Are M.I.T. Students Rational? Report on a Survey

This paper reports the results of a survey conducted in the Massachusetts Institute of Technology campus dining halls. The aim of the survey was to delineate students' perceptions of marginal costs in a very specific, but not uncommon, situation. A majority of the respondents' answers suggest a complete misunderstanding of the relevant marginal costs. *J. Econ. Behav. Organ.*, Mar. 1987, 8(1), pp. 113-20. Stockholm University; Massachusetts Institute of Technology.

Mayhew, Anne—Culture: Core Concept under Attack

Core institutionalist ideas of culture and instrumental valuation come under attack when insistence upon the universality of instrumental reasoning becomes insistent upon the universality and centrality of rational human behavior, and when the study of rational strategy comes to be seen as the important task of social science. The threat to the core of culture-centered social science is intensified when insistence upon the importance of reasonable and rational human behavior is further transformed through a fallacy of composition into a statement about the rational (or irrational) nature of institutions.

of economies with transaction costs, this result is used to discuss the conditions for the existence of an equilibrium in economies with incomplete markets. *Int. Econ. Rev.*, June 1987, 28(2), pp. 275-90. London School of Economics and Bank of Spain.

## 022 Microeconomic Theory

**Appelbaum, E. and Katz, E.**—Asymmetric Taxation and the Theory of the Competitive Firm under Uncertainty

This paper examines the implications of the asymmetries in the tax treatment of corporate profits and losses for the theory of the competitive firm under uncertainty. It is shown that the tax asymmetry introduces a curvature into the firm's target function which affects its behavior in the short run. In long-run industry equilibrium, however, most of the effects disappear at the firm level, but still remain at the industry level. *Can. J. Econ.*, May 1987, 20(2), pp. 357-69. York University; York University and Harvard University.

**Bonanno, Giacomo**—Vertical Differentiation with Cournot Competition

This paper reexamines the problem of whether two firms in the same market choose to produce a homogeneous product or differentiated products. A subgame perfect equilibria of a two-stage game is determined where firms first choose the quality of their products and then compete in prices or outputs. It is shown that the answer depends on the type of competition which is assumed to take place in the post-entry game and on the cost conditions. In particular, if the post-entry game is Cournot Nash, Hotelling's principle of minimum differentiation may hold. *Econ. Notes*, 1986, (2), pp. 68-91. Nuffield College, Oxford.

**Choi, Eun Kwan and Johnson, Stanley R.**—Consumer's Surplus and Price Uncertainty

This paper investigates the conditions under which expected equivalent variation provides a correct ranking of stabilized and uncertain price situations. Expected equivalent variation can be recovered from ordinal preferences whereas *ex ante* equivalent variation requires additional information regarding consumer attitudes toward income risk. The two measures

are equal for income risk-neutral consumers. More important for applied welfare analysis where income risk aversion is presumed, expected equivalent variation provides a lower bound for *ex ante* equivalent variation. These two features of expected equivalent variation commend it as a viable welfare measure for applied work. *Int. Econ. Rev.*, June 1987, 28(2), pp. 407-11. Iowa State University.

**Dionne, Georges and Lasserre, Pierre**—Adverse Selection and Finite-horizon Insurance Contracts

The authors use a particular contract to analyze three issues regarding adverse selection, monopoly, and the use of time within a finite horizon: the description and existence of an epsilon equilibrium; the achievement of a Nash equilibrium; and the optimality of risk revelation. Among the results obtained, the authors show that, at equilibrium, low-risk individuals buy full insurance most of the time and high-risk individuals always buy full insurance. They also show that the equilibrium with risk revelation is a Nash equilibrium. These results are compared with those of the self-selection mechanism in Stiglitz (1977) and the epsilon equilibrium under moral hazard in Radner (1981). *Eur. Econ. Rev.*, June 1987, 31(4), pp. 843-61. University of Montreal.

**Eldor, Rafael and Zilcha, Itzhak**—Discriminating Monopoly, Forward Markets and International Trade

This paper analyzes the effect of uncertainty on output and export of a price-discriminating firm which sells its produce both in domestic and world markets. It is shown that under some conditions exports increase when uncertainty is introduced. In the presence of forward markets a "separation theorem" holds and total output increases to the competitive firm level, while exports are larger than those of the competitive firm. *Int. Econ. Rev.*, June 1987, 28(2), pp. 459-68. Tel-Aviv University.

**Epstein, Larry G.**—The Unimportance of the Intransitivity of Separable Preferences

If preferences are strongly separable in the pointwise partition of goods, then demand functions implied by an intransitive preference ap-

dering can also be generated by a transitive (and strongly separable) ordering. Thus, if strong separability is appropriate, intransitivity is not empirically detectable from demand behavior. Two applications are discussed—the "expected-regret" model of choice under uncertainty and the robustness of turnpike propositions of capital theory. *Int. Econ. Rev.*, June 1987, 28(2), pp. 315–22. University of Toronto.

Fishe, Raymond P. H. and McAfee, R. Preston—Nonlinear Contracts, Zero Profits and Moral Hazard

Contracts that base payments on an *ex post* variable are examined. It is shown that a quadratic contract form may elicit truthful responses from auction participants and offer zero expected profits to the winning bidder, but not eliminate adverse incentives *ex post*. A general impossibility theorem is proven. This theorem establishes that, regardless of functional form, no contract can offer zero expected profits and resolve the *ex post* moral hazard problem. *Economica*, Feb. 1987, 54(213), pp. 97–101. University of Miami; University of Western Ontario.

Flaschel, Peter and Semmler, Willi—Classical and Neoclassical Competitive Adjustment Processes

This article introduces a stable cross-dual adjustment process for Sraffa-von Neumann models. Excluding free goods, but not process extinction, from consideration, it proves furthermore the global asymptotic stability of a simple modification of this classical adjustment process. The relationship of this approach to neoclassical stability analysis and recent attempts to formalize the classical idea of equalizing profit rates is explored. *Manchester Sch. Econ. Soc. Stud.*, Mar. 1987, 55(1), pp. 13–37. Universität Bielefeld, Germany; New School for Social Research, New York.

Freixas, Xavier and Mas-Colell, Andreu—Engel Curves Leading to the Weak Axiom in the Aggregate

For every range of admissible incomes, the authors characterize the class of Engel curves with the property that if an economy has, first, a price independent distribution of income and,

second, preferences which are identical across consumers and generate Engel curves in the class, then the corresponding aggregate demand function satisfies the Weak Axiom of Revealed Preference. This class is defined by two simple conditions. The no-torsion condition says that, in the relevant range of income, the Engel curve is contained in a plane through the origin. The uniform-curvature condition says that, in addition, the Engel curve is either convex or concave to the origin. *Econometrica*, May 1987, 55(3), pp. 515–32. University of Social Sciences of Toulouse; Harvard University.

Gal-Or, Esther—Strategic and Non-strategic Differentiation

When firms choose the characteristic of their products before output is produced, imperfectly competitive firms may use this characteristic strategically so as to reduce the output level produced by the rival. Using a simple two-stage duopoly model, the author demonstrates that such "strategic" use of the product attribute reduces the degree of differentiation between brands. As an outcome, each firm loses some market power and competition is more intense. The author demonstrates through an example that such reduced differentiation leads to reduced joint profits and reduced welfare. *Can. J. Econ.*, May 1987, 20(2), pp. 340–56. University of Pittsburgh.

Gilad, Benjamin; Kaish, Stanley and Loeb, Peter D.—Cognitive Dissonance and Utility Maximization: A General Framework

Neoclassical theory of utility maximization assumes irrational behavior to be unsystematic and therefore impossible to model. Recent advances in behavioral decision theory suggests irrationality may be systematic. In line with these and earlier findings from the theory of cognitive dissonance, a simple descriptive model of utility maximization is developed with the added feature of an information filter. The model is then used to explain a few "irrational" micro and macro behaviors. *J. Econ. Behav. Organ.*, Mar. 1987, 8(1), pp. 61–73. Rutgers University.

Harris, Milton and Holmstrom, Bengt—On the Duration of Agreements

A model of optimal contracts between two infinitely-lived parties, a borrower and lender, is presented and analyzed. The objective is to explain the phenomenon of finite-length, multi-period contracts. It is shown how costly information acquisition can account for multi-period contracts which are of bounded length. Comparative-statics results on how contract length responds to exogenous parameters, such as the cost of information acquisition, are also derived. *Int. Econ. Rev.*, June 1987, 28(2), pp. 389-406. Kellogg Graduate School of Management, Northwestern University; Yale University.

**Hey, John D.—The Dynamic Competitive Firm under Spot Price Uncertainty**

The main result of this paper is that the classic "marginal cost equals price" condition for the output of the perfectly competitive firm in a one-period certain world carries over to a many-period uncertain world if the firm is allowed to hold inventories and if there exists a forward market for the firm's product. This implies the separation of the firm's output decision from its sales decision, and the separation of the firm's output decisions in different periods. Furthermore, output is unaffected by the uncertainty and the firm's attitude to it, though the sales decisions do depend on these factors. *Manchester Sch. Econ. Soc. Stud.*, Mar. 1987, 55(1), pp. 1-12. University of York, England.

**Karni, Edi and Safra, Zvi—"Preference Reversal" and the Observability of Preferences by Experimental Methods**

This paper shows that: (1) the "preference reversal" phenomenon can be consistent with transitive preferences if these preferences violate the independence axiom of expected utility theory and (2) for the class of experiments that were used to produce the evidence concerning "preference reversal," the elicitation of certainty equivalents is possible if, and only if, the respondent's preferences can be represented by functionals that are linear in the probabilities. Furthermore, a more general class of experiments is not immune to "preference reversal" if nonexpected utility preferences are admitted. *Econometrica*, May 1987, 55(3), pp. 675-85. Johns Hopkins University; Tel-Aviv University.

**Laffont, Jean-Jacques and Tirole, Jean—Comparative Statics of the Optimal Dynamic Incentive Contract**

Each period a firm must carry out an indivisible project, the cost of which depends on the firm's constant efficiency and its (variable) level of "effort." Only the cost is observed by the regulator who has to choose the incentive scheme. The optimal dynamic mechanism is derived under possible commitment of the regulator over time. Then, under noncommitment, it is shown that there are four types of continuation equilibria. Also the profile of effort levels is compared to the commitment case. Finally, some numerical comparative statics is performed and it is shown that all types of equilibria can be optimal. *Europ. Econ. Rev.*, June 1987, 31(4), pp. 901-26. University of Social Sciences of Toulouse, France and EHESS, Paris; Massachusetts Institute of Technology.

**Lambson, Val Eugene—Dynamic Behaviour in Large Markets for Differentiated Products**

An important question is how well competitive models approximate models of large finite economies. For a class of differentiated products models, static Nash equilibria, if they exist, always converge to competition as the number of firms increases. Dynamic Nash equilibria need not so converge. Easily checked conditions for convergence to competition do, however, exist. *Rev. Econ. Stud.*, Apr. 1987, 54(2), pp. 293-300. University of Wisconsin.

**Legros, Patrick—Disadvantageous Syndicates and Stable Cartels: The Case of the Nucleolus**

This paper considers a bilateral market with two complementary commodities and gives a rationale for R. J. Aumann's paradox (1973). The relationship between the notion of strong stability of a syndicate, i.e. the property that no group of players wants to exist or to enter the syndicate, and the notion of disadvantageous syndicates is summarized in two results. If the two sides of the market are balanced in terms of endowments, every syndicate is strongly stable. If the two sides of the market are not balanced in terms of endowments, then being advantageous, in Aumann's definition, is necessary and sufficient for a syndicate to be strongly stable. *J. Econ. Theory*, June 1987.

42(1), pp. 30-49. California Institute of Technology.

**Li, Lode; McKelvey, Richard D. and Page, Talbot**—Optimal Research for Cournot Oligopolists

An oligopolistic industry faces uncertain demand. Firms can conduct research prior to production, obtaining private data that is informative of the unknown parameters of demand. Firm strategies thus consist of a level of research and a subsequent production strategy based on their research findings. The authors characterize the Bayes equilibrium of such a model when demand is linear, with unknown intercept, and the information structure has linear conditional expectations. The authors compare the solution to an efficiency standard, finding inefficiencies even in the competitive limit. *J. Econ. Theory*, June 1987, 42(1), pp. 140-66. Massachusetts Institute of Technology; California Institute of Technology; University of California, Los Angeles.

**MacLeod, W. Bentley**—Behavior and the Organization of the Firm

In this paper a new way of distinguishing between cooperative and noncooperative organizations is introduced. This distinction is based on well-known solution concepts and is applied to the problem of organizing production teams in a firm. The author's first result demonstrates that income-sharing cooperative firms are not necessarily inefficient, as suggested in A. Alchian and H. Demsetz (1972) and B. Holmstrom (1982). Second, it is shown that if a capitalist firm is interpreted as a noncooperative organization, then it must be less efficient than corresponding cooperative organizations due to the additional monitoring of workers needed to stop shirking. Finally, an informal discussion is presented explaining why, despite their apparent advantages, more cooperative firms are not observed in practice. *J. Compar. Econ.* June 1987, 11(2), pp. 207-20. Queen's University, Ontario.

**MacLeod, W. Bentley**—Entry, Sunk Costs, and Market Structure

Typically, models that study the role of sunk costs that incumbent firms face entry

by a single firm each period. In this paper, the set of equilibrium market structures that result when all firms are free to enter or exit and set prices each period are characterized. The effect of sunk costs on the market structure is examined and it is shown that sunk costs can take on various forms, each having a different effect on the set of equilibrium market structures. Costs that are sunk due to the existence of product-specific capital do not in general deter entry. Rather, entry deterrence is a necessary outcome only when costs are sunk due to the time it would take to leave the market. *Can. J. Econ.*, Feb. 1987, 20(1), pp. 140-51. Queen's University, Ontario.

**Mariger, Randall P.**—A Life-cycle Consumption Model with Liquidity Constraints: Theory and Empirical Results

A structural consumption model incorporating endogenous liquidity constraints is fit to a cross section of 798 U.S. families. Liquidity constrained families are estimated to constitute 19.4 percent of the population sampled, a group that accounts for 16.7 percent of consumption in the population sampled. In-sample simulations of the model suggest that a temporary tax has three to four times more impact on aggregate consumption than it would if liquidity constraints were not in effect. *Econometrica*, May 1987, 55(3), pp. 533-57. University of Washington.

**Maskin, Eric and Tirole, Jean**—A Theory of Dynamic Oligopoly, III; Cournot Competition

The authors study the Markov perfect equilibrium (MPE) of an alternating move, infinite-horizon duopoly model where the strategic variable is quantity. They exhibit a pair of difference-differential equations that, when they exist, differentiable MPE strategies satisfy. For quadratic payoff functions, they solve these equations in closed form and demonstrate that the MPE corresponding to the solution is the limit of the finite-horizon equilibria as the horizon tends to infinity. The authors conclude with a discussion of adjustment costs and endogenization of the timing. *Europ. Econ. Rev.*, June 1987, 31(4), pp. 947-68. Harvard University; Massachusetts Institute of Technology.

**Matthews, Steven—Comparing Auctions for Risk Averse Buyers: A Buyer's Point of View**

Buyer's preferences over auctions depend on their measure of absolute risk aversion. If it is constant and they have independent private values, they are indifferent between a first-price auction (FPA), a second-price auction (SPA), and a first-price auction in which the number of bidders is revealed before bids are taken (FPA-R). If they have decreasing absolute risk aversion, they prefer the SPA to the FPA-R to the FPA. Their preference for the SPA is diminished to the extent that their values are affiliated. Affiliation also causes them to prefer the number of bidders to be revealed, whereas the seller then prefers to keep it secret. *Econometrica*, May 1987, 55(3), pp. 633-46. Northwestern University and the University of Pennsylvania.

**Meran, Georg and Wolfstetter, Elmar—Optimal Risk Shifting vs. Efficient Employment in Illyria: The Labor-Managed Firm under Asymmetric Information**

Using an optimal-contract framework, the recent literature showed how labor-managed firms can reach efficient employment, internal risk sharing, and risk shifting to outside investors if all information is public. This paper analyzes the labor-managed firm under asymmetric information between members and investors, and explores one-period arrangements in a way which parallels the recent work on optimal wage-employment contracts in capitalist firms. The main result is that, contrary to the Coase theorem, the two specifications of property rights entail different allocations of risk and employment. It is also shown how long-term arrangements ease the conflict between optimal employment and risk shifting. *J. Compar. Econ.*, June 1987, 11(2), pp. 163-79. Free University of Berlin.

**Okuguchi, Koji—Equilibrium Prices in the Bertrand and Cournot Oligopolies**

The equilibrium prices for the Bertrand and Cournot oligopolies with product differentiation are compared. If all firms have linear demand and cost functions and if, in addition, the Jacobian matrix of the demand functions has a dominant negative diagonal, the Cournot equilibrium

prices are now lower than the Bertrand ones. The general condition for the comparison of the Bertrand and Cournot equilibrium prices can be derived even if the nonlinearity is involved in the cost and/or demand functions. *J. Econ. Theory*, June 1987, 42(1), pp. 128-39. Tokyo Metropolitan University.

**Osborne, Martin J. and Pitchik, Carolyn—Cartels, Profits, and Excess Capacity**

A model of a collusive duopoly in which each firm has limited capacity is studied. The negotiated output quotas depend on the bargaining power of the firms, which derives from the damage the firms can do by cutting prices. For fixed capacities, the unit profit of the small firm is at least as large as that of the large firm, and the relative position of the small firm is better when demand is low. When the capacities can be chosen once-and-for-all, there is excess capacity in equilibrium so long as the cost of capacity is not too high. *Int. Econ. Rev.*, June 1987, 28(2), pp. 413-28. McMaster University, Canada; University of Toronto.

**Panzar, John C. and Rosse, James N.—Testing for "Monopoly" Equilibrium**

This paper develops a very general test for "monopoly." Using standard comparative statics analysis, the authors derive testable restrictions on the firm's reduced-form revenue equation which must be satisfied by any profit-maximizing firm whose choices are not affected by either strategic interactions or the threat of entry. For such an unfettered monopolist, the sum of the factor price elasticities of the reduced-form revenue equation must be nonpositive. The set of interesting alternative hypotheses is not empty. The authors develop simple models of oligopolistic, competitive, and monopolistically-competitive markets for which this test statistic may take on positive values. *J. Ind. Econ.*, June 1987, 35(4), pp. 443-56. Northwestern University; Stanford University.

**Ravallion, Martin—On Expectations Formation when Future Welfare Is Contemplated**

People often seem to gain present satisfaction from contemplating a favorable future. This paper examines the implications of such behavior for expectations formation. Formally, satisfaction

tion is said to be derived from "contemplation" whenever *ex post* utility depends on expectations independently of their bearing on *ex ante* actions. Contemplation is shown to be necessary and sufficient for informationally biased forecasting in a model of the intertemporal consumption decision. Thus the Muth-rationality of expectations requires restrictions on the (derived) preference ordering over expectations and realizations which preclude contemplation. Bias tests of surveyed expectations are given a choice-theoretic interpretation. *Kyklos*, 1986, 39(4), pp. 564-73. Research School of Pacific Studies, Australian National University.

**Waldman, Michael**—Noncooperative Entry Deterrence, Uncertainty, and the Free Rider Problem

Previous authors who have considered the issue of noncooperative entry deterrence have not found the free-rider problem to be a significant factor. These authors, however, have only considered models in which the exact investment needed to deter entry is known with certainty. The author adds uncertainty to the models investigated by these previous authors, and demonstrates that the free-rider problem can be significant. That is, for certain types of entry deterring investments the introduction of uncertainty causes the oligopoly to underinvest in entry deterrence; however, for other types no underinvestment result arises. *Rev. Econ. Stud.*, Apr. 1987, 54(2), pp. 301-10. University of California, Los Angeles.

**Zaghini, Enrico**—Natural Prices and Market Prices. An Interpretation of the Walrasian Theory of Accumulation

This paper analyzes the relationship between classical price theory and Walrasian price theory. It is shown how the two classical notions of market prices and of natural prices are integral and inseparable aspects of the classical conception of the competitive mechanism of capital accumulation. It is argued that the proper comparison of classical and Walrasian price theories cannot be made if we consider the exchange and production model in which capital goods are exclusively considered. It is shown how the Walrasian accumulation theory constitutes the theoretical foundation of the classical concep-

tion of natural prices. *Econ. Notes*, Apr. 1986, (1), pp. 10-59. University of Rome.

**023 Macroeconomic Theory**

**Allsbrook, Ogden O. and Gilliam, Kenneth P.**—An Attenuated Exposition of the Ramsey-Keynes Rate of Saving

Using a simplified format common to both Ramsey and Keynes savings arguments, the Ramsey argument is redeveloped and, where Keynes' argument seemingly differs, is translated into the format which generalizes Ramsey's rule. With this common approach, relationships between capital, income, consumption, saving, and assumptions for the optimal saving rate are determined. *Econ. Notes*, 1986, (3), pp. 70-84. University of Georgia; Kennesaw College.

**Andersen, Torben M.**—Effective Demand, Differential Information and the Multiplier

The paper develops a rigorous model of the interaction between employment, income and demand. It is shown that when agents are differently informed about the income generated in the economy, aggregate demand shocks create a Keynesian-type unemployment. Moreover, the model explains nominal wage/price stickiness and a multiplier effect so as to imply that a larger burden of adjustment is taken by quantities rather than prices. *Econ. J.*, June 1987, 97(386), pp. 353-71. University of Aarhus, Denmark.

**d'Autume, Antoine and Michel, Philippe**—Déséquilibre général et investissement (General Disequilibrium and Investment)

The authors analyze an intertemporal disequilibrium macroeconomic model under perfect foresight and with a fixed real wage. The focus is on investment behavior derived from an intertemporal optimization. The introduction of overtime work ensures the absence of discontinuities between regimes. This enables the authors to clarify the respective roles of the real wage level, autonomous demand, and expectations in the determination of the level of output both in the short and long run. *Ann. Econ. Statist.*, Oct./Dec. 1986, (4), pp. 23-51 (French). University of Paris-I and Laboratoire d'Economie Politique de l'ENS; Centre de

Mathématiques Économiques et d'Informatique, University of Paris-I.

Blanchard, Olivier J. and Summers, Lawrence H.—Fiscal Increasing Returns, Hysteresis, Real Wages and Unemployment

European unemployment is widely regarded as a problem of excessive real wages. It is often stressed that there is a sharp conflict between the interests of those currently employed and the unemployed. This paper shows that this conflict is less acute than is usually thought. It shows that, because of a kind of fiscal increasing returns, increases in employment in Europe are likely to be associated with rising real take-home pay for workers because economic expansion makes possible reductions in taxes sufficiently large to offset any diminishing returns to labor. Under a variety of plausible conditions, tax cuts would succeed in stimulating employment. *Europ. Econ. Rev.*, Apr. 1987, 31(3), pp. 543–60. Massachusetts Institute of Technology and National Bureau of Economic Research; Harvard University and National Bureau of Economic Research.

Bródy, András; Martinás, Katalin and Sajó, Konstantin—An Essay on Macroeconomics

Theoretical tools of constructive thermodynamics can be applied to analyze the change of the macroscopic variables of a given economic subsystem. In close analogy to the entropy function, a Z potential function, depending only on the macroscopic variables, may be set up and shall be clearly increasing during regular economic processes. *Acta Oecon.*, 1985, 35(3–4), pp. 337–43. Institute of Economics, Hungarian Academy of Sciences, Budapest; Eötvös Loránd University, Budapest; Eötvös Loránd University, Budapest.

Chopra, Ajai and Montiel, Peter J.—Output and Unanticipated Money with Imported Intermediate Goods and Foreign Exchange Rationing

This paper develops a simple "new classical" structural model that includes several features likely to be of importance in developing countries. The economy is modeled as an open economy along Mundell–Fleming lines, imported

intermediate goods are introduced, and foreign exchange is assumed to be rationed. A reduced-form output equation is derived from this model, which is a generalization of its closed-economy analog. After the properties of the model are analyzed, the reduced-form output equation is estimated for the Philippines. The empirical results conform quite closely to the predictions of the model. *Int. Monet. Fund Staff Pap.*, Dec. 1986, 33(4), pp. 697–721. International Monetary Fund, Washington, D.C.

Darity, William A., Jr. and Cottrell, Allin F.—Meade's General Theory Model: A Geometric Reprise

James Meade's 1937 two-sector formalization of Keynes's *General Theory* is reconsidered in some detail. This paper develops a geometric scheme that facilitates the use of comparative statics in working with the Meade model to demonstrate the richness of its possibilities. The paper also argues that the Meade model might have provided a superior starting point for the development of algebraic interpretations of Keynes's system when compared with John R. Hicks's IS–LL framework, particularly since the Meade model affords a direct bridge toward James Tobin's monetary transmission mechanism. *J. Money, Credit, Banking*, May 1987, 19(2), pp. 210–21. University of North Carolina; Elon College.

Flemming, J. S.—Wage Flexibility and Employment Stability

How is the variance of employment affected by the speed of response of money wages to labor market disequilibrium? This is considered in a model which, apart from partial adjustment of the wage, is neoclassical, including rational expectations. Output is determined by demand which, like supply, is subject to shocks which affect employment. A faster wage response increases the impact of shocks on employment. In some cases this outweighs the effect of speedier equilibration, supporting an assertion of Keynes's. Since the nominal wage that is given in the short-run monetary policy is important, several variants are considered. *Oxford Econ. Pap.*, Mar. 1987, 39(1), pp. 161–74. Bank of England and Nuffield College, Oxford.

**Greenfield, Robert L.—Walras's Law in Macroeconomic Disequilibrium**

Does Walras's Law hold in general disequilibrium? This note finds in the affirmative. Against a depression's unmistakably effective excess supplies of goods and services stands an effective excess demand for money. Expressed in terms of effective excess demands, Walras's Law, far from the equilibrium condition that some writers portray, is a tool of disequilibrium analysis. The Law reminds us how effective and notional demands diverge in the first place and why any apparent failure of effective demand for currently produced output stems from attempts to hold cash balances adding up to more money than actually exists. *Australian Econ. Pap.*, Dec. 1986, 25(47), pp. 257–60. Fairleigh Dickinson University.

**Greenwald, B. and Stiglitz, J. E.—Keynesian, New Keynesian and New Classical Economics**

Formal developments of Keynes's *General Theory*, while attempting to achieve a new classical synthesis of the realities of observed macroeconomic fluctuation and unemployment with classical microeconomics, have come to be surprisingly closely tied to the old classical models. Keynes's insights have been reduced largely to an assumption of nominal price rigidities. In fact, Keynes's original qualitative approach contained a much richer description of economic reality. This paper describes how fully rational microeconomic models incorporating imperfect information and incomplete markets, very much in the Keynesian tradition, imply macroeconomic behavior that encompasses most of the qualitative insights of the *General Theory*. *Oxford Econ. Pap.*, Mar. 1987, 39(1), pp. 119–33. Bell Communications Research, Morristown, New Jersey; Princeton University and the Hoover Institution, Stanford University.

**Marini, Giancarlo—Price Variability, Supply-Side Policies and Monetary Rules**

Wage-subsidy policies or demand management are equally effective in stabilizing output about its frictionless level in Fischer–Gray predetermined labor-contracts models. However, if the authorities are also concerned with price

variability, the optimal monetary rule is unambiguously superior. *Economica*, Feb. 1987, 54(213), pp. 109–11. London School of Economics.

**Newell, A. and Symons, J. S. V.—Corporatism, Laissez Faire, and the Rise in Unemployment**

This paper studies the relationship between wage-setting institutions and the behavior of unemployment in a number of countries. It argues that *laissez-faire* wage setting generates a high and often variable unemployment rate. Corporatism, wage setting by central organizations commanding the obedience of individual workers and employers, can generate a lower wage rate and a higher employment. This theoretical analysis is complemented by econometric work, and by discussion of the institutions of Sweden, Germany, the United Kingdom, Japan, and the United States. *Europ. Econ. Rev.*, Apr. 1987, 31(3), pp. 567–605. London School of Economics.

**Patterson, Kerry David—The Development of Expectations Generating Schemes Which Are Asymptotically Rational**

As an alternative to the hypothesis of fully rational expectations, this study develops the concept of asymptotically rational expectations, and applies it in the problem of model design. Easily applied conditions are derived to ensure asymptotic rationality and several models are developed which satisfy these conditions. The connections are shown between developments of the adaptive expectations hypothesis and, *inter alia*, error-correction mechanisms. The ideas are illustrated with the Livingston price-expectations data. *Scott. J. Polit. Econ.*, Feb. 1987, 34(1), pp. 1–18. University of Reading, England and Bank of England.

**Phaneuf, Louis—Propriétés dynamiques des modèles du cycle à contrats échelonnés (The Dynamic Properties of Staggered Contracts Models)**

This paper investigates the robustness of the dynamic properties of staggered-contracts models. The author first analyzes the persistence of several different types of shocks in a model with constant nominal wages over the life of

ie contracts. The dynamic pattern of the effects of some types of shocks suggests problems with the staggered-contracts formulation. Second, it is shown that under the assumption of variable nominal wages during contracts, the effects of all shocks last only one period despite the existence of two-period nominal rigidities. *Can. J. Econ.*, Feb. 1987, 20(1), pp. 123-39 (French). University of Quebec at Montreal.

**Reynolds, Peter J.—Wage Rises and Income Distribution—A Note**

This paper examines the effect of money-wage increases on manual labor's share of value added for the U.K. manufacturing sector using core-periphery model. An increase in the money-wage increases, for example from 10 percent to 11 percent, constrains firms' margins and thereby increases manual labor's share by an estimated 1 percent immediately and by a further 1 percent if the higher rate of wage increases is sustained. For an open economy, manual labor's share would be further increased, depending on the source of inputs and the extent to which material prices keep pace with wage costs. *Manchester Sch. Econ. Soc. Stud.*, Mar. 1987, 55(1), pp. 77-87. North Staffordshire Polytechnic, England.

**Rowe, Nicholas—An Extreme Keynesian Macro-economic Model with Formal Micro-economic Foundations**

This paper presents a formal general-equilibrium model of a monetary economy in which agents' decision rules are derived from the underlying preferences, technology, endowments, and information. Firms face linked demand curves for the reason given by J. Stiglitz (1979)—customers know the price at their current firm but not at other firms. The results are compatible with extreme Keynesian macro-economic predictions, as presented by J. Woglom (1982). There is no automatic tendency to full employment, and a change in the money supply may cause a permanent change in real output with no change in prices. *Can. Econ.*, May 1987, 20(2), pp. 306-20. Carleton University, Ontario.

**Seath, William M.—Can Economic Growth Make Monetarist Arithmetic Pleasant?**

A monetarist policy rule requires bond-financed budget deficits, and this policy is feasible if the real growth rate exceeds the after-tax interest rate. The author assumes this condition is met, but still finds that bond-financed deficits lead to larger output deviations than do money-financed deficits. The model involves rational expectations, sticky prices in the short run, and natural rate features in full equilibrium. A significant attempt is made to avoid the Lucas critique, since the rate of price adjustment is allowed to depend on deficit-financing policy as dictated by the microeconomic underpinnings. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 1028-36. McMaster University, Canada.

**Sneessens, Henri R.—Investment and the Inflation-Unemployment Tradeoff in a Macroeconomic Rationing Model with Monopolistic Competition**

This paper develops a stylized macroeconomic disequilibrium model in which the three regimes of Keynesian unemployment, classical unemployment, and repressed inflation are explicitly distinguished, and wherein prices and the capital stock are endogenously determined by profit-maximizing firms. The framework is one of monopolistic competition, and the macroeconomic price and employment relationships are derived by explicit aggregation over individual firms. Because different firms can be in different regimes, the three regimes listed above always coexist at the aggregate level, and do so in proportions that may vary through time. *Europ. Econ. Rev.*, Apr. 1987, 31(3), pp. 781-808. Catholic University of Louvain and Faculté Libre de Sciences Economiques de Lille, France.

**Sweeney, Richard J.—Some Macro Implications of Risk**

Using the capital asset pricing model as the financial sector of a conventional rational-expectations macro model, an increase in expected inflation reduces the long-run capital stock, contrary to the usual result. This occurs because the induced fall in real balances increases equity's share in the market, raises equity's beta and discount rate, and reduces investment. Increases in the variance of disturbances to aggregate

gate demand reduce the capital stock, while increases in the variance of inflation raise the stock. A proportionate increase in both variances reduces the capital stock. *J. Money, Credit, Banking*, May 1987, 19(2), pp. 222-34. Claremont McKenna College and Claremont Graduate School.

**Woods, J. E.**—On the Matrix Multiplier

The multiplier is usually treated within the context of expenditure models, either aggregate or multi-sectoral, with the emphasis mainly, if not solely, on propensities to save. The restrictiveness of this approach can be appreciated once incomes are divided into wages and profits. Then, the multiplier depends not only on the conditions of production and the distribution of income but also, in a multi-sector model, on the different consumption patterns. The purpose of this paper is to give an account of a general matrix multiplier, dependent on these four sets of factors, and to consider certain special cases. *Econ. Notes*, Apr. 1986, (1), pp. 167-78. University of London.

**Wulwick, Nancy J.**—The Phillips Curve: Which? Whose? To Do What? How?

Often we read in the press that "economists disagree." Indeed, the title of this essay points to discord. There are several Phillips curves which represent an inverse relation between inflation and unemployment. Applying the methodology of scientific research programs, this essay analyzes why economists have focused on the Phillips relation and explains how competition between economists has led to development of different Phillips models. The approach is historical while the concern is economic methodology. The conclusion contrasts the importance of competing models in economics with that in mathematics and the natural sciences. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 834-57. Le Moyne College.

#### 024 Welfare Theory

**Berrebi, Z. M. and Silber, Jacques G.**—Dispersion, Asymmetry and the Gini Index of Inequality

The paper shows that the value of the Gini Index of Inequality (Concentration) depends on

the skewness of the income distribution. It first proved that the Gini Index belongs to the family of relative mean deviations. Then a new asymmetry index is defined which allows one to show that the Gini Index of symmetric distributions is always smaller or equal to one-half whereas a necessary condition for the Gini Index to be greater than one-half is that the distribution be skewed to the right. *Int. Econ. Rev.* June 1987, 28(2), pp. 331-38. Bar-Ilan University, Israel.

**Buchanan, James M.**—Towards the Simple Economics of Natural Liberty: An Exploratory Analysis

Individuals with legally protected endowments have incentives to allow maximal liberties of purchase or sale to persons on the opposing sides of potential trades. Unless overtly restricted, potential buyers and sellers will be allowed freedom of entry into all markets, thereby insuring maximization of combined consumer and producer surplus or rent. Since liberty, as defined, is a valued but not a scarce good, it is optimally utilized when it is not valued at the margin. The relationship between liberty and rent is examined, and individuals have incentives to extend liberties to others as means of protecting their own rents. *Kyklos* 1987, 40(1), pp. 3-20. George Mason University.

**Meyer, Margaret A. and Mookherjee, Dilip.**—Incentives, Compensation, and Social Welfare

Alternative wage structures under conditions of moral hazard are analyzed from a social welfare standpoint. It is argued that *ex post* equity judgements in an uncertainty context should incorporate a preference for "positive correlation" of utilities of different individuals. In the design of compensation schemes, this may give rise to a conflict between *ex post* equity objectives and the need to provide effort incentives: relative performance clauses in compensation schemes that are useful for providing incentives are undesirable from an *ex post* equity standpoint. *Rev. Econ. Stud.*, Apr. 1987, 54(2), pp. 209-26. St. John's College, Oxford and Stanford University; Stanford University.

**Pyatt, Graham—Measuring Welfare, Poverty and Inequality**

A class of poverty measures is identified, the members of which satisfy strong monotonicity and transfer conditions. These measures are closely related to indices of income inequality based on the notion of a mean-equivalent income. A restriction on the class of admissible measures allows poverty to be interpreted in terms of the loss in mean-equivalent income resulting from the fact that some people are poor. *Econ. J.*, June 1987, 97(386), pp. 459-67. University of Warwick.

**Satchell, Stephen E.—Source and Subgroup Decomposition Inequalities for the Lorenz Curve**

In this note, the author derives inequalities on the Lorenz curve of an aggregate income distribution in terms of the Lorenz curves of its constituent parts. These parts are made up of different income sources in one case and different groups in another. These inequalities are applied to the class of linear inequality measures to derive a further set of inequalities. The method of proof for the Lorenz inequalities is based on statistical arguments involving the use of asymptotic theory. *Int. Econ. Rev.*, June 1987, 28(2), pp. 323-29. Trinity College, Cambridge.

**Tinari, Frank D.—Reducing Income Inequality Is Not the Only "Equitable" Fairness Criterion**

Many allegations of "unfairness" in distributional policy are based predominantly on the criterion of income-inequality reduction. But a more equal income distribution is not the sole standard for judging distributional equity. Alternative equity criteria may or may not be consistent with that of reducing income inequality. After discussing the efficiency-equality tradeoff, this paper examines the tradeoffs existing among equity criteria. It applies four equity criteria to two public-policy issues to determine to what extent they may be judged "equitable," finding that steel-import tariffs fail most equity criteria, but eliminating the minimum wage for teenagers generates favorable equity effects. *Rev. Soc. Econ.*, Apr. 1987, 45(1), pp. 77-91. Seton Hall University.

**025 Social Choice**

**Guttman, Joel M.—A Non-Cournot Model of Voluntary Collective Action**

The interaction of selfish, rational actors in the provision of a public good is analyzed in an attempt to explain recent experimental findings as well as real-world cases of voluntary collective action. The model, which allows for more sophisticated behavior than that assumed by the conventional Cournot theory, predicts a higher level of collective action than that theory. The impacts of income effects and of the price elasticity of demand for the public good are given special emphasis. *Economica*, Feb. 1987, 54(213), pp. 1-19. Bar-Ilan University, Israel.

**Mueller, Dennis C.—The Growth of Government: A Public Choice Perspective**

The focus of this review is on explanations of government size that stem from the literature on public choice. The various explanations are grouped into five categories: (1) government as provider of public goods and eliminator of externalities; (2) government as redistributor of income and wealth; (3) interest groups; (4) the bureaucracy; and (5) fiscal illusion. These five explanations in turn reflect two opposing conceptualizations of the state: the citizen over the state, and the state over the citizen. Although no single explanation for government size is found to have overwhelming logical and empirical support, some merit is found in several public-choice arguments. *Int. Monet. Fund Staff Pap.*, Mar. 1987, 34(1), pp. 115-49. University of Maryland.

**026 Economics of Uncertainty and Information; Game Theory and Bargaining Theory**

**Banks, Jeffrey S. and Sobel, Joel—Equilibrium Selection in Signaling Games**

The authors introduce a new solution concept, divine equilibrium, which refines the set of sequential equilibria in signaling games by requiring that off-the-equilibrium-path beliefs satisfy an additional restriction. This restriction rules out implausible sequential equilibria in examples. Divine equilibria exist because a sequential equilibrium that fails to be divine cannot be in a stable component. The authors demonstrate through examples that the stable

component of signaling games is typically smaller than the set of divine equilibria and present a characterization of the set of stable outcomes in generic signaling games. *Econometrica*, May 1987, 55(3), pp. 647-64. Rochester University; University of California, San Diego.

**Bernheim, B. Douglas; Peleg, Bezalel and Whinston, Michael D.**—Coalition-Proof Nash Equilibria: Concepts

In an important class of "noncooperative" environments, it is natural to assume that players can freely discuss their strategies, but cannot make binding commitments. In such cases, any meaningful agreement between the players must be self-enforcing. Although the Nash best-response property is a necessary condition for self-enforceability, it is not sufficient—it is in general possible for coalitions to arrange plausible, mutually-beneficial deviations from Nash agreements. The authors provide a stronger definition of self-enforceability, and label the class of efficient self-enforcing agreements "coalition-proof." *J. Econ. Theory*, June 1987, 42(1), pp. 1-12. Stanford University; Hebrew University, Israel; Harvard University.

**Bernheim, B. Douglas and Whinston, Michael D.**—Coalition-Proof Nash Equilibria: Applications

In Bernheim, Peleg, and Whinston (1987), the authors proposed the notion of coalition-proof Nash equilibrium and perfectly coalition-proof Nash equilibrium as solution concepts for strategic environments in which players can freely discuss their strategies, but cannot make binding commitments. This paper undertakes applications to several economic problems, including the behavior of Cournot oligopolists, oligopolistic entry deterrence, cooperation in finite horizon games, and social-choice rule implementation. *J. Econ. Theory*, June 1987, 42(1), pp. 13-29. Stanford University; Harvard University.

**Chatterjee, Kalyan and Samuelson, Larry**—Bargaining with Two-Sided Incomplete Information: An Infinite Horizon Model with Alternating Offers

This paper examines an infinite-horizon bargaining model, incorporating two-sided incomplete information, uncertainty concerning the

potential gains from trade, an illumination of interesting qualitative bargaining issues, and plausible equilibria. These features have powerful implications. A Nash equilibrium exists, and is generically both unique and sequential. Comparative static implications of variations in the game's specifications are developed. The authors find that natural indications of bargaining strength emerge from the model, and establish the intuitive result that an increase in a player's relative bargaining strength makes that player more likely to capture the gains from bargaining. *Rev. Econ. Stud.*, Apr. 1987, 54(2), pp. 175-92. Pennsylvania State University.

**Cheng, Hsueh-Cheng; Magill, Michael J. P. and Shafer, Wayne J.**—Some Results on Comparative Statics under Uncertainty

This paper presents results on comparative statics for a class of decision problems under uncertainty. Necessary and sufficient conditions are derived for parameter changes and stochastically dominant shifts in the return in the two-asset portfolio problem. These results give conditions for the demand for money to be inversely related to the rate of interest. Further applications include the qualitative behavior of aggregate savings under uncertainty and the production decision of a firm facing price uncertainty. *Int. Econ. Rev.*, June 1987, 28(2), pp. 493-507. University of Southern California.

**Cramton, Peter; Gibbons, Robert and Klemperer, Paul**—Dissolving a Partnership Efficiently

Several partners jointly own an asset that may be traded among them. Each partner has a valuation for the asset. The valuations are known privately and drawn independently from a common probability distribution. The authors characterize the set of all incentive-compatible and interim individually-rational trading mechanisms, and give a simple necessary and sufficient condition for such mechanisms to dissolve the partnership *ex post* efficiently. A bidding game is constructed that achieves such dissolution whenever it is possible. Despite incomplete information about the valuation of the asset, a partnership can be dissolved *ex post* efficiently provided no single partner owns too large a share. *Econometrica*, May 1987, 55(3),

pp. 615-32. Yale University; Massachusetts Institute of Technology; St. Catherine's College, Oxford University.

**Engers, Maxim—Signalling with Many Signals**

This paper examines a market with asymmetric information where there are many signals available and where both the costs of signaling and the product value may depend on many privately known characteristics. Under a weak condition on the relationship between the marginal cost of increasing the signals and the product value, a separating set exists whereby the value of every seller's product is inferred from the seller's optimal choice of signals. The separating set constructed is Pareto dominant and corresponds to recently proposed equilibrium notions in signaling and screening models. *Econometrica*, May 1987, 55(3), pp. 663-74. University of Virginia.

**Gal-Or, Esther—First Mover Disadvantages with Private Information**

The author considers a leader-follower game with output quantities as strategies, so as to demonstrate the reduced advantages of the Stackleberg leader in a stochastic environment with private information. At the equilibrium, the strategy of the leader reveals to the follower information about the demand. In an attempt to signal low demand, the leader contracts his output. Nevertheless, unless the leader's information is infinitely noisy, the follower can always correctly infer his signal. The author finds a wide range of parameter values over which the follower is better-off compared to the leader. *Rev. Econ. Stud.*, Apr. 1987, 54(2), pp. 279-92. University of Pittsburgh and Technion-Israel Institute of Technology.

**Hagerty, Kathleen M. and Rogerson, William P.—Robust Trading Mechanisms**

This paper considers the problem of designing a trading institution for a single buyer and seller when their valuation of the good is private information. It is shown that posted-price mechanisms are essentially the only mechanisms such that each trader has a dominant strategy. A posted-price mechanism is one where a price is posted in advance and trade occurs if, and only if, all traders agree to trade.

*J. Econ. Theory*, June 1987, 42(1), pp. 94-107. Northwestern University.

**Nalebuff, Barry and Scharfstein, David—Testing in Models of Asymmetric Information**

This paper explores the role of testing in models of asymmetric information. The authors demonstrate conditions under which testing for underlying characteristics can overcome adverse selection problems and lead to a full-information competitive equilibrium. This paper provides a more general statement of J. Mirrlees's result on the optimal use of infinite fines. Where testing cannot fully resolve the problems associated with asymmetric information, the authors outline the source of the difficulties. In problems with asymmetric information, testing to discover an agent's chosen action or underlying characteristics may significantly reduce the cost of moral hazard and adverse selection. *Rev. Econ. Stud.*, Apr. 1987, 54(2), pp. 265-77. Princeton University; Harvard University.

**Palfrey, Thomas R. and Srivastava, Sanjay—On Bayesian Implementable Allocations**

This paper identifies several social-choice correspondences which are or are not fully implementable in economic environments when agents are incompletely informed about the environment. The authors show that in contrast to results in the case of complete information, neither efficient allocations nor core allocations define implementable social-choice correspondences. The authors also identify conditions under which the Rational Expectations Equilibrium correspondence is implementable. The authors extend the concepts of fair allocations and Lindahl allocations to economies with incomplete information, and show that envy-free allocation and Lindahl allocations are implementable under some conditions while fair allocations are not. *Rev. Econ. Stud.*, Apr 1987, 54(2), pp. 193-208. California Institute of Technology; Carnegie-Mellon University.

**Thomson, William—Monotonicity of Bargaining Solutions with Respect to the Disagreement Point**

The author investigates whether the best known solutions to the bargaining problem respond appropriately to certain changes in the

disagreement point  $d_i$  for a fixed feasible set. If  $d_i$  increases, while for each  $j \neq i$ ,  $d_j$  remains constant, then these solutions recommend an increase in agent  $i$ 's payoff, in agreement with intuition. However, the stronger requirement that agent  $i$  be the only one to gain is not generally met. *J. Econ. Theory*, June 1987, 42(1), pp. 50-58. University of Rochester.

**Wooders, Myrna Holtz and Zame, William R.**—Large Games; Fair and Stable Outcomes

The authors establish that for a broad class of large games with sidepayments, fair outcomes are nearly stable. More precisely, the Shapley value of a large game is in the  $\epsilon$ -core and  $\epsilon$  is very small if the game is very large. The proof uses two other results of independent interest: for large games the power of improvement is concentrated in small coalitions; and the Shapley value of a small syndicate acting together is nearly the sum of the Shapley values which accrue to the members acting alone. *J. Econ. Theory*, June 1987, 42(1), pp. 59-93. University of Toronto; State University of New York, Buffalo.

**027 Economics of Centrally Planned Economies**

**Bonin, John P. and Fukuda, Wataru**—Controlling a Risk-Averse, Effort-Selecting Manager in the Soviet Incentive Model

In this paper the authors establish the robustness of the comparative static results under managerial risk aversion and discretionary behavior for the Bonin- and Weitzman-type Soviet incentive schemes. Specifically, they show that the self-imposed target (forecasted performance) responds appropriately to changes in the penalty piecerates, and that the share parameter can be used to encourage a higher norm and an accompanying higher level of managerial effort. The results correct an error in the literature on the Bonin-type scheme and impose weaker conditions than previous work on the Weitzman-type scheme. *J. Compar. Econ.*, June 1987, 11(2), pp. 221-33. Wesleyan University; Kobe University, Japan.

**Darvish, Tikva and Kahana, Nava**—the Ratchet Principle: A Diagrammatic Interpretation

Using a two-period graphic model, it is shown that the Soviet fixed-incentive scheme does not

function, even under conditions of certainty. Allowing the incentive coefficient to change over time will not necessarily induce the manager to work efficiently. Only when the target is feasible for both periods will a flexible incentive scheme function. *J. Compar. Econ.*, June 1987, 11(2), pp. 245-49. Bar-Ilan University.

**Galasi, Péter and Kertesi, Gábor**—Second Economy, Competition, Inflation

In recent years, the legal frameworks of the second economy have been considerably expanded. It had been expected that the supply of consumer goods and services would grow, their quality improve, their range of choice expand, and the intensity of shortage diminish. The results are lagging behind the expectations because a sort of monopolistic structure still characterizes the Hungarian market. The state sector and the second economy divide the market between themselves so that there is no real competition between them. *Acta Oecon.*, 1985, 35(3-4), pp. 269-93. Karl Marx University of Economics, Budapest; Institute of Economics, Hungarian Academy of Sciences, Budapest.

**Grosfeld, Irena**—Modeling Planners' Investment Behavior: Poland, 1956-1981

Planners' investment decisions, usually taken as exogenous, are estimated in this paper by the maximum-likelihood method with threshold effects. Planners look for a macroeconomic equilibrium and are sensitive to information about internal and external pressures, but their adjustment is not smooth; they react to disequilibrium indicators only after the imbalances go beyond some threshold. So long as the tensions are "weak," planners are inclined to ignore them and planners' behavior is guided by simple rules of thumb. Estimated threshold values separate different regimes of planners' behavior. *J. Compar. Econ.*, June 1987, 11(2), pp. 180-91. Centre National de la Recherche Scientifique, Centre d'Economie Quantitative et Comparative, Paris.

**Nuti, D. M.**—Michal Kalecki's Contribution to the Theory and Practice of Socialist Planning

Four main contributions are singled out and discussed: a comprehensive model of organization alternative to both the Soviet and Oskar

Lange's models, with mark-up pricing related to the needs of investment finance, quantity adjustments, net value indicators, full employment, and workers' control; a theorization of external and political limits to planners' accumulation policy; rationalization of Soviet-type investment selection practice, with multiple but similar shadow interest rates governing technical choice but not the path of expansion; and a practical procedure for drawing perspective plans for investment and long-run development. These contributions are shown to be related to Polish conditions in the 1960s and to require qualifications which reduce their generality but not their relevance either there and then or elsewhere today. *Cambridge J. Econ.*, Dec. 1986, 10(4), pp. 333-53. European University Institute, Florence, Italy.

**Oxenstierna, Susanne**—Bonuses, Factor Demand, and Technical Efficiency in the Soviet Enterprise

The implications of successive changes in bonus rules which have taken place between 1965 and 1986 on the input choices of the Soviet enterprise are explored under the assumption that enterprises maximize their bonus funds. The results show increasing concern about labor saving during the 1970s and 1980s as compared with the capital-saving schemes introduced in the mid-1960s. The bonus schemes presented for the second half of the 1980s induced the enterprise to use factors in efficient combinations. *J. Compar. Econ.*, June 1987, 11(2), pp. 234-44. Swedish Institute for Social Research, University of Stockholm.

**Podkaminer, Leon**—Investment Cycles in Centrally Planned Economies: An Explanation Involving Consumer Market Disequilibrium and Labour Shortage

The investment expansions, which are to some extent caused by the authorities' preference for full employment, accelerate the deterioration in the consumer-market situation. There are five mutually reinforcing mechanisms which transform market disequilibria into a declining quantity and quality of work performed by consumers. The ensuing acute shortage of labor finally paralyzes the investment expansions. At the same time it dispels authorities'

anxiety about future unemployment. To avoid instability a much more flexible wage and price policy is needed. *Acta Oecon.*, 1985, 35(1-2), pp. 133-44. Presidential Office of All-Polish Confederation of Trade Unions, Warsaw.

**Wanless, P. T.**—The Efficiency of Central Planning: A Perspective from 'Markets vs Hierarchies'

Central planning of "socialist economies" is one form of nonmarket allocation of resources. Under certain circumstances, nonmarket allocation is more efficient than market allocation, largely because of the transaction costs of market contracting. The new institutional economics "markets vs. hierarchies" makes the case for the efficiency advantages of nonmarket resource allocation within firms by means of corporate planning. Similar advantages can be claimed for central planning, while economic reform of centrally-planned economies can be explained as organizational change, particularly the transition from the "U-form" to "M-form" corporation. *Scot. J. Polit. Econ.*, Feb. 1987, 34(1), pp. 52-68. Paisley College of Technology, United Kingdom.

**Zalai, Ernő**—Joint Production and Labour Values

In the case of joint production the inputs cannot be divided between products in a natural way. As a result, none of the three alternative definitions given by Karl Marx for labor values can generally be applied in this case. This means that the definition of labor values has to be generalized. Any such generalization will contradict some of the original Marxian notions. However, a solution which relies on a price-dependent division of inputs between products is closest to the general spirit of the Marxian analysis. *Acta Oecon.*, 1985, 35(3-4), pp. 327-36. Karl Marx University of Economics, Budapest.

#### 630 HISTORY OF ECONOMIC THOUGHT; METHODOLOGY

##### 631 History of Economic Thought

**Burgstaller, André**—Demand and Relative Price in Ricardo: An Examination of Outstanding Issues

The role of demand in David Ricardo's corn model is reexamined, with a view to resolving the conflict between labor-theory-of-value and general-equilibrium approaches to its interpretation. Four propositions regarding the relationship between demand and market, natural, momentary, and stationary-state price are rigorously established within a framework identical to L. Pasinetti (1960) in every respect but one: unlike Pasinetti's, the model at hand renders parametrically explicit the landlord consumption decision as between wage goods and luxuries. *Hist. Polit. Econ.*, Summer 1987, 19(2), pp. 207-15. Barnard College, Columbia University.

**Craver, Earlene and Leijonhufvud, Axel—**Economics in America: The Continental Influence

A large number of European economists of distinction immigrated to the United States between the World Wars. A number of them made notable contributions to the development of the field of econometrics. In this paper presented at the 1985 AEA meetings, the authors discuss the connections between Germany and the United States prior to the emigration and suggest some ways in which there had been a cross-fertilization of ideas. *Hist. Polit. Econ.*, Summer 1987, 19(2), pp. 173-82. University of California, Los Angeles.

**Jensen, Hans E.—**Alfred Marshall as a Social Economist

The paper argues that Marshall was a social economist since he operated with the following: (1) a body of ethics and a vision of the future good society; (2) a concept of a poverty-plagued economic reality; (3) a model of this reality; (4) analytic tools designed to explain and predict the behavior of the model; (5) an analysis, using the tools, of such behavior; and (6) analysis-based proposals for reforms to eradicate poverty and reduce inequality. Dealing primarily with topics (1), (2), and (6), the article inquires into the origins and nature of Marshall's ethics, vision, concept of reality, and recommendations for reforms so radical that he labeled himself a "socialist." *Rev. Soc. Econ.*, Apr. 1987, 45(1), pp. 14-36. University of Tennessee.

**Kleiman, Ephraim—**Opportunity Cost, Human Capital, and Some Related Economic Concepts in Talmudic Literature

The substitution of the retributive justice of the Old Testament by a code of material compensations gave rise to attempts to decompose the effects of injury into its different components, to be compensated for separately. The discussion in the Talmud of these concepts and of the manner in which they could be estimated provides us with a view of the Tannaitic and the Amoraic conceptualization of such basic economic notions as opportunity costs, human capital, transitory and permanent income changes, and stock and flow concepts. Their consideration of compensations for pain has much in common with modern welfare analysis. Underlying the Talmudic debate is the reliance on markets to provide measures of value based on actual opportunity costs. *Hist. Polit. Econ.*, Summer 1987, 19(2), pp. 261-87. Hebrew University, Jerusalem.

**Littleboy, Bruce and Mehta, Ghanshyam—**Patinkin on Keynes' Theory of Effective Demand

This paper argues that Keynes's theory of effective demand in the *Treatise* is more advanced and systematic than Don Patinkin is prepared to accept. It criticizes aspects of Patinkin's arguments which have the effect of underestimating the force of Keynes's attack on the classicals in the *Treatise*. *Hist. Polit. Econ.*, Summer 1987, 19(2), pp. 311-28. University of Queensland, Australia.

**Petrella, Frank—**Daniel Raymond, Adam Smith, and Classical Growth Theory: An Inquiry into the Nature and Causes of the Wealth of America

Although Raymond was viewed as a non-laissez-faire interventionist, his early nineteenth century *Elements of Political Economy* was compatible with Smith's *Wealth of Nations*, especially Smith's theory of economic growth and development. Raymond's attempt to develop a uniquely American theory of political economy was unsuccessful. However, his growth theory and moderate view of government activity were rooted in important hard-core assumptions of the classical research program, notably

at economic self-interest motivated rational decision making and that market competition maximized economic welfare given the proper institutional framework. *Hist. Polit. Econ.*, Summer 1987, 19(2), pp. 239-60. Holy Cross College.

**wer, Simon—The Origins of the Heckscher-Ohlin Concept**

This article examines the origins of the Heckscher-Ohlin concept, i.e., the proposition that countries tend to export commodities requiring relatively large amounts of their relatively abundant factors of production and import commodities requiring relatively large amounts of their relatively scarce factors of production. A major contention of the article is at the discussion of historical antecedents by Ohlin (1933) and later commentators is somewhat misleading in the sense that the Heckscher-Ohlin concept is possessed of a far younger and richer intellectual heritage. *Hist. Polit. Econ.*, Summer 1987, 19(2), pp. 289-98. University of Regina, Canada.

**Allen, John M.—Lord Grenville's Manuscript Notes on Malthus**

A copy of T. R. Malthus's *Principles of Political Economy* (1820), now held in the Kashnor collection of the National Library of Australia, contains extensive annotations by William Wyndham Grenville (1759-1834). Grenville was a prominent figure in English political life, and his parliamentary speeches and several published pamphlets show that he was an astute commentator on practical policy issues. But these manuscript notes reveal that he also possessed considerable competence in the current theoretical controversies of political economy. They contain some incisive criticisms of Malthus's views and make some theoretical contributions significant in their own right. *Hist. Polit. Econ.*, Summer 1987, 19(2), pp. 217-37. University of New England, Armidale, Australia.

**Rodríguez Braun, Carlos—Capital's Last Chapter**

This article challenges the widespread view according to which Karl Marx deliberately

changed the order of *Capital's* first volume. Achille Loria and Maximilien Rubel have argued that Marx, in order to avoid censorship, invented an arbitrary "last" chapter on colonization; the real conclusive chapter, consequently, was the preceding and much more revolutionary one, dealing with primitive accumulation. This article explores Marx's opinion on colonies in *Capital* and defends the original order of chapters in the book. *Hist. Polit. Econ.*, Summer 1987, 19(2), pp. 299-310. Facultad de Ciencias Económicas y Empresariales, Universidad Complutense, Madrid, Spain.

**Rutherford, Robert P.—Malthus and Keynes**

Keynes claimed Malthus as a forerunner. Most commentators have argued that he was mistaken. However, the comparison has been unduly concentrated on Keynes's *General Theory*. The chronology of the claims Keynes made for Malthus suggests that we examine other sources, especially the *Treatise on Money*. It is argued that Malthus's analysis of the post-Napoleonic depression corresponds to the depression process in Keynes's *Treatise* and that there is an essential similarity of conception over the role of the rate of profit and the way changes in income distribution can result in a failure of effective demand. *Oxford Econ. Pap.*, Mar. 1987, 39(1), pp. 175-89. University of Tasmania, Australia.

**Rutherford, Robert P.—Ricardo's Mantle**

This paper analyzes the recent debate over Ricardian economics and assesses its implications for both the history of thought and modern economics. It is argued that "Ricardo's Mantle" is worth fighting for because lineages in ideas form the implicit bedrock of assumptions which condition the framing of explicit models. The methodological chasms involved in interpretation are explored by developing skeletal versions of the traditional model and S. Hollander's "new view." The importance ascribed to the Corn Laws debate in forming Ricardo's system is seen to be central and Hollander's unfamiliar Ricardo is argued to rest on a methodological revolution in interpretation. *Australian Econ. Pap.*, Dec. 1986, 25(47), pp. 206-21. University of Tasmania, Australia.

**Solow, Robert M.**—What Do We Know that Francis Amasa Walker Didn't?

This article uses Walker's text *Political economy* as a vehicle for a brief discussion of changes in orientation, factual knowledge, and technique in the century since its publication. Walker's clear-headed emphasis on the fundamentals of supply and demand is worth special mention. *Hist. Polit. Econ.*, Summer 1987, 19(2), pp. 183–89. Massachusetts Institute of Technology.

**Taurand, Francis and Hung, Nguyen Manh**—Pitfalls in a Received Idea: Ricardian Decreasing Returns at the Extensive Margin of a Natural Resource

The Ricardian theory of constantly decreasing returns on additional units of a self-renewable resource states that "best resources are used first, except for location and technical change." Using modern economic theory, the authors show this result to be an unfounded prejudice. Their model of the original Ricardian land problem easily displays initial increasing returns, thus solving a 150-year-old empirical puzzle, H. Carey's paradox of switches in historical land use patterns. The Ricardian result may be empirically correct in specific cases but cannot claim general theoretical validity. *Can. J. Econ.*, Feb. 1987, 20(1), pp. 61–73. Université Laval, Montreal.

**Walker, Donald A.**—Why Keynes's "General Theory" was a Success

This essay identifies the reasons for the success of Keynes's *General Theory* during the four or five years after its publication. The reasons are not difficult to discern in the records of the 1930s, so the justification for this essay is that in it the reasons are collected together, formulated clearly, classified into groups, and documented by the words of Keynes's contemporaries. The reasons include Keynes's reputation and activities, the book's theoretical content, its relevance for policy, its relationship to national income accounting and econometrics, its stylistic brilliance, and its incorporation of detailed knowledge of economic institutions and business practices. *Econ. Notes*, 1986, (3), pp. 5–29. Indiana University of Pennsylvania.

**Waterman, A. M. C.**—On the Malthusian Theory of Long Swings

In Robert Malthus's *Essay on Population* economic growth consists of alternating surges of population (during which real wages fall and the rate of profit rises) and capital (during which the reverse occurs). A series of temporary equilibria exists at which wages are maximal, the rate of profit minimal, and fully-employed work force in technically-determined relation to fixed capital stock. Between these equilibria occur episodes of excess labor, below-maximum wages, above minimum profit rate and capital accumulation. Malthus's "ratios" presuppose a logarithmic production function which implies that the full-employment real wage will fall to subsistence, and that the full-employment "wages fund" is constant. *Can. J. Econ.*, May 1987, 20(2), pp. 257–70. Robinson College, Cambridge, England.

#### 036 Economic Methodology

**Finn, Daniel Rush**—When Are Economic Explanations Persuasive? A View from Social Economics

This essay employs three basic concepts, the ground of explanation, the mode of explanation, and the canons of evidence, to analyze the shifting understanding in economic thought of what makes for good economic explanations. It finds John Stuart Mill differing from the historical, Marxian, and institutional schools more on the ground of explanation (part vs. whole) than on the mode of explanation (inductive vs. deduction). Mill also admitted nonempirical evidence in his canons of evidence, while institutionalism pressed for more empirical work. Contemporary neoclassicism retains Mill's part as ground of explanation, is ambiguous on induction vs. deduction, and rejects all nonempirical evidence. *Rev. Soc. Econ.*, Apr. 1987, 45(1), pp. 1–13. St. John's University, Collegeville, Minnesota.

#### 040 ECONOMIC HISTORY

**042 Economic History: United States and Canada**  
**Altman, Morris**—A Revision of Canadian Economic Growth: 1870–1910 (A Challenge to the Gradualist Interpretation)

The author presents revised estimates of real gross manufacturing output and growth. Also,

for the first time, estimates are presented for real value added: (1) in manufacturing; (2) per capita; and (3) per employee in manufacturing, and their corresponding growth rates. These estimates involve the use of existing price indices and new ones constructed for this study. Details on the construction of these indices and output estimates are also presented. The results of this paper refute the received view that Canada's manufacturing sector sustained steady and relatively vigorous growth over the period 1870-1910. Findings suggest that the growth performance of Canada's manufacturing sector became substantive only at the turn of the twentieth century with the arrival of the wheat boom. *Can. J. Econ.*, Feb. 1987, 20(1), pp. 86-113. University of Ottawa.

**Mullineaux, Donald J.—Competitive Monies and the Suffolk Bank System: A Contractual Perspective**

This paper analyzes the Suffolk Bank System (1824-1858) as a contractual mechanism for controlling the quality of privately-produced monies (bank notes) in New England. The contractual aspects of the system, such as incentives, monitoring activities, and control procedures, are interpreted as a franchise-like device providing a trademark for monies. The end of the Suffolk System is viewed as a private response to competition involving a contractually inferior mechanism (The Bank for Mutual Redemption). The paper concludes that historical evidence suggests some form of hierarchical control is necessary for viable money production. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 884-98. University of Kentucky.

**044 Economic History: Europe**

**Broadberry, Stephen N.—Purchasing Power Parity and the Pound-Dollar Rate in the 1930s**

Opponents of flexible exchange rates have stressed their volatility during the 1930s, while advocates of flexible exchange rates have stressed their relationship to fundamental economic variables. The author reconciles the two views, allowing that although exchange rates did move to preserve purchasing power parity in the long run, there could be substantial deviations from purchasing power parity in the short

run. For the pound-dollar rate, the source of the large fluctuations in the early 1930s lay in the asymmetric response of foreign-exchange markets to fluctuations in Britain and America while the latter adhered to the gold standard. *Economica*, Feb. 1987, 54(213), pp. 69-78. University College, Cardiff, United Kingdom.

**050 ECONOMIC SYSTEMS**

**051 Capitalist Economic Systems**

**Blanchflower, David G. and Oswald, Andrew J.—Profit Sharing—Can It Work?**

The paper surveys the theoretical and empirical literature on the economic effects of profit sharing between workers and firms. It is critical of the case for government subsidization of such sharing schemes. *Oxford Econ. Pap.*, Mar. 1987, 39(1), pp. 1-19. University of Surrey; London School of Economics.

**Dandekar, Vinayak M.—Economies as Differentiated Systems**

A new model is constructed admitting certain elements of von Neumann and Sraffa models while rejecting others. Enterprises are characterized by given technology and also by given activity levels. Prices are determined to maximize ratios of net output to input. No positive prices can equalize these ratios. Distribution of net output is internal to each enterprise and resulting rents, profits, and wages are not necessarily equal between enterprises. There are subeconomies, some independent producing all their inputs, others dependent for some inputs on other subeconomies. The subeconomies trade in intermediate and final consumption goods in which some gain while others lose. *J. Econ. Issues*, June 1987, 21(2), pp. 813-25. Indian School of Political Economy.

**052 Socialist and Communist Economic Systems**

**Dietrich, Michael—Organisational Requirements of a Socialist Economy: Theoretical and Practical Suggestions**

This article argues that theoretical and practical difficulties exist in the socialist economic organization literature and suggests how the problems can be overcome. In uncertain, non-steady-state conditions, any economy is an amalgam of control systems. Planning, informal, autonomous, and instrumental systems are

identified in the paper via a critique of Walrasian theory. Practical suggestions apply developments in corporate planning, particularly strategic business units. This allows socialist economic organization efficiency to marry strategic and operating matters. The importance of informal economic relationships is also stressed. *Cambridge J. Econ.*, Dec. 1986, 10(4), pp. 319-32. Brighton Polytechnic, United Kingdom.

**Szamuely, László**—Prospects of Economic Reforms in the European CMEA Countries in the 80s

Both the compelling need for change in the system of economic control and the perception of its necessity by the political and economic leadership are present today in the majority of the European socialist countries. And yet the 1980s have not become a decade of reforms, since the impending economic crisis could only be averted by emergency manoeuvres which were carried out by strictly centralized measures. Another reason for the delay was the fact that the society, and first and foremost its leading strata, attach very high value to stability. *Acta Oecon.*, 1986, 36(1-2), pp. 55-65. Institute for World Economics, Hungarian Academy of Sciences, Budapest.

**Tardos, Márton**—The Conditions of Developing a Regulated Market

The Hungarian experience proves that commodity markets cannot be operated alone in an economy without labor, money, and capital markets. The creation of the latter does not conflict with the state control of economy, since there is a great need for a strict aggregate demand policy. A more efficient utilization of the market than the present one requires a more fundamental change in the traditional control methods of the socialist economy than the one offered by the current modifications in Hungary. *Acta Oecon.*, 1986, 36(1-2), pp. 67-89. Institute of Economics, Hungarian Academy of Sciences, Budapest.

### 653 Comparative Economic Systems

**Boyd, Michael L.**—The Performance of Private and Cooperative Socialist Organization: Post-war Yugoslav Agriculture

Socialist enterprises in Yugoslav agriculture show higher levels of productivity than private producers. The author examines the sources of these differences with total factor productivity estimates based on sectoral aggregate Cobb-Douglas production functions which permit separation of environmental, policy, and organizational effects. The results support the following conclusions: cooperative socialist enterprises are not inherently inefficient and can even outperform private producers; both types of producers were responding to their environment and their differential rates of technological change reflect the different constraints they faced; and socialist enterprises exhibited technology adoption behavior similar to nonsocialist enterprises elsewhere. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 205-14. University of Vermont.

### 100 Economic Growth; Development; Planning; Fluctuations

**110 ECONOMIC GROWTH; DEVELOPMENT; AND PLANNING THEORY AND POLICY**

**111 Economic Growth Theory and Models**

**Bernheim, B. Douglas and Ray, Debraj**—Economic Growth with Intergenerational Altruism

The authors consider the properties of equilibrium behavior in an aggregative growth model with intergenerational altruism. Various positive properties such as the cyclicity of equilibrium programs and the convergence of equilibrium stocks to a steady state, are analyzed. Among other normative properties, it is established that under certain natural conditions Nash equilibrium programs are efficient and "modified Pareto optimal" in a sense made clear in the paper, but never Pareto optimal in the traditional sense. *Rev. Econ. Stud.*, Apr. 1987, 54(2), pp. 227-41. Stanford University.

**Bidard, Christian and Hosoda, Eiji**—On Consumption Baskets in a Generalized von Neumann Model

The paper generalizes the von Neuman growth model extended by M. Morishima. Morishima introduced capitalists' consumption and workers' savings into the model. But his proof of the existence of the balanced-growth equilibrium crucially depends upon the as-

on that every good must be in consumption baskets for some price level. In other he assumed that there is no distinction in capital goods and consumption goods. own that the model has a solution even assumption is relaxed. A variant of Galeo-Debreu lemma is used to prove the results. *Int. Econ. Rev.*, June 1987, 28(2), 1-19. Nanterre University, France; Keio University, Tokyo.

#### Economic Planning Theory and Policy

gi, Lajos—The Seventh Five-Year Plan for the Hungarian Economy (for 1986-1990) The Hungarian economy has in recent years exhausted the possibilities which the need of curbing the domestic use of national income is in the interest of improving equilibrium. The main endeavour of the plan is to accelerate the modernization of the economy by relying on ever better performance; to stimulate economic growth gradually; to improve living standards. The inevitable structural changes will affect a substantial part of the population in the interest of whom the social security has to be strengthened. *Econ. J.*, 1986, 36(1-2), pp. 3-19. National Planning Office, Budapest.

János—Alternatives of Growth and Priorities in the 7th Five-Year Plan of Hungary (1986-1990)

rate of growth of the Hungarian economy is to surpass the threshold of perceptibility in the years 1986-1990 if the general equilibrium—including that of the balance-of-payments—is restored. The principal targets of the 7th plan are the following: energy consumption is allowed to grow only at an essential lower rate than national income; exports in convertible currencies have to be expanded; foreign trade settled in roubles has to be boosted; and the efficiency of production has to be definitely strengthened by modernization of the product pattern. *Acta Econ.*, 1985, 1, pp. 17-28. National Planning Office, Budapest.

Rezső—National Economic Objectives and the Reform Process in Hungary in the 1980s

The three priorities in economic policy for the period between 1986-1990 are: the maintenance and consolidation of the external equilibrium; further expansion of enterprise autonomy and the implementation of a market-conform government control; and resumption of economic growth as a consequence of improved external competitiveness of Hungarian goods. To achieve these objectives a consistent theoretical framework has to be elaborated. The further development of the system of political institutions and the adjustment of the style of politics to the logic of the economic system are also essential. *Acta Econ.*, 1985, 35(1-2), pp. 1-16. Institute of Economics, Hungarian Academy of Sciences, Budapest.

#### 114 Economics of War, Defense, and Disarmament

Jackson, M. W.—Chocolate-Box Soldiers: A Critique of 'An Economic Theory of Military Tactics'

The purpose of this article is to challenge Geoffrey Brennan and Gordon Tullock's 1982 application of methodological individualism to battle. The author's thesis is that methodological individualism distorts the social nature of combat. To defend this thesis, first, he argues that the analysis of Brennan and Tullock assumes the very thing that is most in doubt in a battle, namely, that anyone is motivated to be killed or to kill. These motivations rest on the social ties of combatants to their comrades. Finally, a proper understanding of heroism illustrates the responsibility and sacrifice of battle neglected by Brennan and Tullock's analysis. *J. Econ. Behav. Organ.*, Mar. 1987, 8(1), pp. 1-11. The University of Sydney.

Nourzad, Farrokh—A Reexamination of the Effect of Rapid Military Spending on Inflation

The hypothesis that rapid defense buildup contributes to inflation recently has been rejected by Donald F. Vitallano (1984). In this paper, it is argued that this result is misleading, given that it is obtained under the implausible assumption of a constant expected real rate of interest. The hypothesis is reexamined using a well-known measure of the expected inflation rate, and it is found that growth of defense spending has a statistically-significant positive

effect on the rate of price inflation. *Quart. J. Bus. Econ.*, Summer 1987, 26(3), pp. 57-66. Marquette University.

## 120 COUNTRY STUDIES

### 122 Economic Studies of Developed Countries

van Gemert, Henk G.—Structural Change in OECD Countries: A Normal Pattern Analysis

This article discusses the development of sector shares against the background of growing per capita income and some other key variables. It elaborates on H. B. Chenery's normal pattern approach, which emphasizes the existence of regularities. Long-term dynamics in the economic structure are quantified. Conclusions are drawn with respect to the continuing process of industrialization, the role of the service sector, and the rise or decline of manufacturing subsectors. The slowdown of overall growth rates and the discovery of energy resources are given special attention. Finally, the article tries to detect some country-specific specialization patterns. *De Economist*, Mar. 1987, 135(1), pp. 29-51. Tilburg University, the Netherlands.

### 123 Comparative Studies of Developing, Developed, and/or Centrally Planned Economies

Rimler, Judit—Economic Obsolescence and Employment (A Comparative Analysis of the Hungarian and Dutch Economies)

The vintage-model analysis shows that industrial employment has changed in the Netherlands and in Hungary under the impact of different factors. The changes in staff in the Dutch industry have been motivated by efficiency viewpoints. Owing to rising labor costs the old vintages, engaging a relatively large amount of labor, have increasingly been substituted for by new ones. In Hungary the reason was the exhaustion of labor supply. *Acta Oecon.*, 1986, 36(1-2), pp. 123-40. Institute of Economics, Hungarian Academy of Sciences, Budapest.

### 124 Economic Studies of Centrally Planned Economies

Aganbegyan, A. G.—The New Economic Strategy of the USSR and Its Social Dimensions

The 1986 Congress of the Communist Party of the Soviet Union set a new course for national

economic and social policy. Reliance on extensive means of growth had been leading the economy into a blind alley: from now on the emphasis will be shifted to intensive means. The ambitious targets set for accelerating development over the next fifteen years are to be achieved through a radical reform of management, the strengthening of material incentives, and an overhaul of the economic machinery. The entire production apparatus is to be modernized and retooled to meet people's needs and ensure a new quality of growth. *Int. Lab. Rev.*, Jan-Feb. 1987, 126(1), pp. 95-109. U.S.S.R. Academy of Sciences.

Halpern, László and Molnár, György—Income Formation, Accumulation and Price Trends in Hungary in the 1970s

The difference between the accumulation structure of the Hungarian economy and the sectoral structure of the income financing accumulation was not diminishing during the 1970s. One of the basic causes of this development is that definite development preferences are observable in the resource allocating process. Industry, construction, and agriculture were unambiguously preferred, while the service sector was dispreferred in the whole period. Based on model computations, it can be stated that in the 1970s those branches were preferred which also secured the distributable income for redistribution. *Acta Oecon.*, 1985, 35(1-2), pp. 105-32. Institute of Economics, Hungarian Academy of Sciences, Budapest.

Illés, Iván—Structural Changes in the Hungarian Economy (1979-1985)

The structural shifts in the investments of the socialist sector, and within it particularly the central investments, are exactly opposite to the shifts in the income pattern of the national economy; this can be observed in the sectoral as well as in the regional structure. This phenomenon is only partly due to the normal compensation processes; the fact is that the central allocation of investment funds has been driven to forced paths. At the same time some balancing forces have gained ground: e.g. the diversification of enterprises and cooperatives, new forms of enterprises, and the households' investment activity. *Acta Oecon.*, 1986, 36(1-

), pp. 21–33. Institute of Economic Planning of the National Planning Office, Budapest.

**etschnig, Mária**—Causes and Difficulties in Changing the Normal State of the Hungarian Economy

The Hungarian economy has to answer the world economic challenge in the form of structural adjustment. Up to now no change has occurred in the normal state of economy that would have been guided by the reform programs; the regulatory powers of the economic system proved to be stronger than the intentions working for change. The basic feature of enterprise behavior has remained unaltered: the management pays attention first of all to the intentions of the government and not to the signals of the market. Resources are being allocated in the course of an invisible competition, and the economy is dominated by vertical relations. *Acta Oecon.*, 1985, 35(3–4), pp. 235–40. National Bank of Hungary, Budapest.

**izakolczai, György; Bagdy, Gábor and Vincics, József**—Dependence of the Hungarian Economic Performance on the World Economy. Facts and Economic Policy Inferences

This article, using in the first part simple graphs and in the second part econometric methods, shows that the development of the Hungarian economy depends on world economic events, and that all important domestic variables are directly influenced by the import index of Hungary's main Western trading partners. Hungary's economic behavior is therefore practically the same as that of other smaller open economies. It could also be demonstrated that only imports can be influenced by macroeconomic-demand policy, while exports can only be promoted by policies concentrating on the microeconomic aspects of the firms' behavior. *Acta Oecon.*, 1985, 35(3–4), pp. 295–311. Econometric Laboratory at the Institute of Economics, Hungarian Academy of Sciences, Budapest; Institute for Industrial Economics, Budapest; National Planning Office, Budapest.

### 130 ECONOMIC FLUCTUATIONS; FORECASTING; STABILIZATION; AND INFLATION

#### 31 Economic Fluctuations

**McCallum, Bennett T.**—On "Real" and "Sticky-Price" Theories of the Business Cycle

This paper begins by identifying the distinguishing characteristic of the "real-business-cycle" class of macroeconomic models. It then scrutinizes existing evidence, presented in support of the real-business-cycle approach, of three types: calibrated general-equilibrium models with no monetary sector; vector-autoregression variance decomposition results; and univariate measurements of trend and cyclical components. It is argued that, in fact, these types of evidence have so far provided little support for the real-business-cycle hypothesis. Finally, with regard to an important alternative hypothesis concerning macroeconomic fluctuations, the paper proposes a partial rationalization for the stickiness of nominal product prices. *J. Money, Credit, Banking*, Nov. 1986, 19(4), pp. 397–414. Carnegie-Mellon University.

**Rohwer, Bernd**—Der Konjunkturaufschwung 1983–1986—Ein Erfolg des wirtschaftspolitischen Kurswechsels der christlich-liberalen Koalition? Einige Anmerkungen zur konjunkturtheoretischen Beurteilung des gegenwärtigen Aufschwungs (The Business Revival 1983–1986 in West Germany—A Success of the CDU/CSU–FDP Coalition's Change of Policy?—Some Remarks on the Causes of the Present Business Upswing)

The paper presents some estimations concerning the influence of endogenous and exogenous factors on the business cycle. Although exogenous impulses (especially fiscal and monetary policy and foreign trade) have had considerable effects on the specific shape of the business cycle in the Federal Republic of Germany during 1963–83, the business fluctuations essentially have been the result of the interplay of destabilizing and stabilizing endogenous influences. For the actual business revival it is shown that the political change in October 1982 merely gave the psychological "initial spark." The upswing in 1984–85 was primarily produced by foreign-trade impulses, whereas the domestic-growth impulses remained comparatively subdued until 1986. *Konjunkturpolitik*, 1986, 32(6), pp. 325–48 (German). University Freiburg, Germany.

**Roland, Gérard**—Investment Growth Fluctuations in the Soviet Union: An Econometric Analysis

This paper investigates the determinants of overall investment growth in the Soviet Union by means of an econometric analysis using data for 1959–1982. Theory suggests that investment growth responds to structural pressures toward high growth and to the intensities of shortage in the economy. Econometric results are encouraging since the fitted variable follows, with the exception of 1966, all peaks and troughs of investment growth. *J. Compar. Econ.*, June 1987, 11(2), pp. 192–206. Free University of Brussels.

### 132 Forecasting: Econometric Models

**Buchenroth, Sheree and Jennings, Robert—**  
A Descriptive Analysis of the Time Series Behavior of Financial Analyst Earnings Forecasts

This paper presents an empirical examination of quarterly changes in consensus analyst forecasts of annual earnings and the dispersion of the individual forecasts comprised by the consensus. The formation and revision of beliefs play a key role in many fundamental issues in finance. Investors' consensus beliefs are important in determining equilibrium prices and the dispersion of beliefs has been suggested as an *ex ante* measure of risk. Little is known about the time-series behavior of these variables. This study reports the results of an analysis of quarterly changes in these variables using a time series of forecasts beginning with a seven-quarter ahead forecast for a large sample of firms. The median quarterly change in consensus analyst forecast was found to be a series of small negative changes. Analyst forecast dispersion, when measured by the coefficient of variation instead of the across-analyst standard deviation, declines throughout the horizon. *Quart. J. Bus. Econ.*, Summer 1987, 26(3), pp. 22–41. Indiana University.

**Haas, Richard D. and Masson, Paul R.—**MINIMOD: Specification and Simulation Results

The paper presents a small macroeconomic model, MINIMOD, of the United States and its major industrial trading partners. The model is based on conventional theory, with particular attention paid to capital accumulation and long-run properties. MINIMOD's parameters were obtained by applying partial stimulation tech-

niques to a much larger multicountry model. The model is simulated under two alternative assumptions about how expectations of future inflation rates, long-term interest rates, and exchange rates are formed: expectations are either formed adaptively, based on past movements in the variables; or expectations are forward looking, based on the model's own predictions. *Int. Monet. Fund Staff Pap.*, Dec. 1986, 33(4), pp. 722–67. International Monetary Fund, Washington, D.C.

**Hughes Hallett, Andrew J.—**International Competitiveness and Economic Recovery: Examples of the Risk–Ambition Trade-Off in Dutch Economic Policies

The disadvantage of certainty-equivalent decisions is that they are invariant to risk. This paper contrasts certainty equivalence with risk-sensitive rules derived by combining the first two movements of a stochastic objective. Adjusting the weight in that combination traces out an uncertainty frontier, from risk neutrality to pure risk aversion. The inflation–output–wages trade-off is studied as a function of increasing risk aversion in Dutch policy making. Risks are reduced by preserving purchasing power (removing wage restraint) at the cost of output and the economy's international competitiveness. *Manchester Sch. Econ. Soc. Stud.*, Mar. 1987, 55(1), pp. 38–59. University of Newcastle-upon-Tyne.

**Zarnowitz, Victor and Lambros, Louis A.—**Consensus and Uncertainty in Economic Prediction

The authors define "consensus" as the degree of agreement among point predictions aimed at the same target by different individuals and "uncertainty" as the diffuseness of the corresponding probability distributions. This distinction is made operational with the aid of the NBER–ASA survey data on matched point and probabilistic forecasts of inflation and the rate of change in gross national product. The means of the two sets of forecasts agree closely. Standard deviations of point forecasts tend to understate uncertainty as measured by standard deviations of the predictive probability distributions. However, these measures of consensus and uncertainty are on the whole positively correlated. *J. Polit. Econ.*, June 1987, 95(3), pp.

591-621. University of Chicago and National Bureau of Economic Research.

**133 General Outlook and Stabilization Theories and Policies**

**Gapinski, James H.**—Capital Lessons in Leaning against the Wind

This paper examines how the nature of capital bears on the effectiveness of countercyclical policy. Underlying the inquiry is a macro model which postulates that capital in place differs from capital in design. It also postulates that fiscal and monetary actions follow asymmetric feedback rules keyed to unemployment. As the malleability or durability of capital lessens, the system is observed through simulation to respond more turbulently when disturbed. To moderate that response, feedback controls are altered in strength, and although they generally succeed in reducing system turbulence, their success rate is shown to depend heavily and complexly upon capital's makeup. *J. Money, Credit, Banking*, May 1987, 19(2), pp. 235-45. Florida State University.

**van der Hoeven, Rolph**—External Shocks and Stabilisation Policies: Spreading the Load

Many developing countries have been forced to adopt stabilization policies to cope with a series of external shocks which have adversely affected various macroeconomic indicators, including employment and income levels. Most of the policies have been applied too abruptly to take into account the specific circumstances of the countries concerned and their particular difficulties. Therefore, stabilization policies should: be made more selective; be spread over a longer period of time; and pay more heed to land redistribution and the satisfaction of basic needs for the poor so that the costs are shared more equitably and a firmer basis is laid for sustained growth. Greater consensus for the measures introduced also needs to be secured if they are to be successful. *Int. Lab. Rev.*, Mar.-Apr. 1987, 126(2), pp. 133-50. International Labour Office, Geneva.

**Köves, András**—Foreign Economic Equilibrium, Economic Development and Economic Policy in the CMEA Countries

The foreign debt burden of all the smaller European CMEA countries became critical by

the early 1980s. Some inevitable restrictions on imports have been introduced which have proven to be useful. Since the balance-of-payments tensions of most of these countries eased in the mid-1980s, there is now room for a revision and reorientation of their economic policy. Competitive imports have to be allowed to enter the domestic market which should become a lever in the process of differentiation taking place on the basis of efficiency criteria. This would lead to an increase in both the volume and the profitability of Hungarian exports in the longer run. *Acta Oecon.*, 1986, 36(1-2), pp. 35-53. Institute for Economic and Market Research, Budapest.

**Montiel, Peter J.**—Output and Unanticipated Money in the Dependent Economy Model

This paper builds a "new classical" model for a fixed exchange-rate economy based on the dependent economy framework, which has proved particularly fruitful for the analysis of macroeconomic issues in developing countries. The implied reduced-form output equations are quite different from their closed, one-sector counterparts. In particular, anticipated policy changes have real effects in this model, though these effects differ from those of unanticipated changes. These equations are estimated for Mexico for the fixed exchange-rate period 1953-75. The results cast some doubts on the relevance of new classical analysis for Mexico during this period. *Int. Monet. Fund Staff Pap.*, June 1987, 34(2), pp. 228-59. International Monetary Fund, Washington, D.C.

**Tardos, Márton**—Question Marks in Hungarian Fiscal and Monetary Policy (1979-1984)

In Hungary, the economic policy evens out the financial results of enterprises on three levels: through price control; the subsidies and levies of the state budget; and the credit mechanism. The mechanisms of income leveling after 1979 put a strong brake on the process of consolidation which became necessary in the wake of the international credit crisis. A lasting solution can only be expected from the abolition of investment and wage regulation and the imposition of a firm control of aggregate demand. This would exert a financial pressure on enterprises, forcing them to moderate their product

pattern, increase the efficiency of their production, and to dismiss superfluous labor. *Acta Oecon.*, 1985, 35(1-2), pp. 29-52. Institute of Economics, Hungarian Academy of Sciences, Budapest.

### 134 Inflation and Deflation

**Buiter, Willem H.**—A Fiscal Theory of Hyperdeflations? Some Surprising Monetarist Arithmetic

For the range of "small" government deficits for which two stationary solutions exist, an increase in the deficit reduces the long-run rate of inflation if the locally-stable (high inflation) stationary equilibrium is chosen, increases it if the locally-unstable (low inflation) equilibrium is chosen. Explosive, unstable behavior always involves a steadily increasing negative rate of inflation, i.e. a "hyperdeflation." There always exist deficits so large that stationary solutions do not exist. Behavior then is unstable and explosive: hyperinflations are ruled out and hyperdeflations must result. Empirical studies of hyperinflations should no longer use the rational-expectations version of the Sargent-Wallace model as a theoretical backdrop. *Oxford Econ. Pap.*, Mar. 1987, 39(1), pp. 111-18. Yale University.

## 200 Quantitative Economic Methods and Data

### 210 ECONOMETRIC, STATISTICAL, AND MATHEMATICAL METHODS AND MODELS

#### 211 Econometric and Statistical Methods and Models

**Anderson, G. J.**—Prediction Tests in Limited Dependent Variable Models

This paper discusses the problem of assessing the predictive power of a model in the class of limited dependent variable models. The use of dummy variables in this context in standard regression models has been discussed in Salkever (1976), however problems emerge if such an approach is taken when the dummy appears in a limit of an integral that has to be evaluated. The paper proposes tests of predictive power which circumvent these problems. *J. Econometrics*, Jan./Feb. 1987, 34(1/2), pp. 253-61. McMaster University, Canada.

**Blundell, Richard and Meghir, Costas**—Bivariate Alternatives to the Tobit Model

In this paper the authors present two broad classes of bivariate models for the analysis of individual commodity demand and labor supply behavior. The unifying characteristic of both classes of models and the reason why they have been labeled "bivariate" is the definition of a separate process determining the zero-one discrete behavior from that determining the continuous observations. In each case the separate processes relax one of the strong assumptions underlying the standard Tobit model. Given the choice of bivariate model for each case, the authors consider a set of misspecification tests that are designed to check the adequacy of the stochastic structure underlying each model. The majority of these tests are based on the Score test or Lagrange Multiplier test methodology. *J. Econometrics*, Jan./Feb. 1987, 34(1/2), pp. 179-200. University College London.

**Chamberlain, Gary**—Asymptotic Efficiency in Estimation with Conditional Moment Restrictions

In this paper, bounds on asymptotic efficiency are derived for a class of non-parametric models. The data are independent and identically distributed according to some unknown distribution  $F$ . There is a given function of the data and a parameter. The restrictions are that a conditional expectation of this function is zero at some point in the parameter space; this point is to be estimated. If  $F$  is assumed to be a multinomial distribution with known (finite) support, then the problem becomes parametric and the bound can be obtained from the information matrix. This bound turns out to depend only upon certain conditional moments, and not upon the support of the distribution. Since a general  $F$  can be approximated by a multinomial distribution, the multinomial bound applies to the general case. *J. Econometrics*, Mar. 1987, 34(3), pp. 305-34. University of Wisconsin.

**Chesher, Andrew and Irish, Margaret**—Residual Analysis in the Grouped and Censored Normal Linear Model

Graphical and numerical analysis of residuals can be informative about model misspecification even when data are censored or grouped.

This paper provides simple procedures for calculating diagnostic statistics to detect model misspecification when grouped or censored data are analyzed using a normal linear model. Graphs can reveal the nature of the correlation that these statistics pick up, but when grouping or censoring is severe they can be difficult to interpret. The authors discuss the processing of graphs so that they are more easily interpreted and provide examples based on artificial data and on grouped data relating to unemployment durations. *J. Econometrics*, Jan./Feb. 1987, 34(1/2), pp. 33-61. Bristol University.

Clarke, Judith A.; Giles, David E. A. and Wallace, T. Dudley—Estimating the Error Variance in Regression after a Preliminary Test of Restrictions on the Coefficients

Maximum-likelihood estimation of the variance of the disturbances in a linear regression is considered in the context of exact linear restrictions on the coefficient vector. The exact risk function for the associated preliminary-test estimator of this variance is derived and evaluated numerically on the basis of relative quadratic loss. Results indicate that in practical situations the risk of the pretest estimator differs only slightly from that of the naive estimator which ignores the restrictions without testing. Applying the coefficient restrictions without testing their validity is not recommended. *J. Econometrics*, Mar. 1987, 34(3), pp. 293-304. Monash University; University of Canterbury; Duke University.

Cosslett, Stephen R.—Efficiency Bounds for Distribution-free Estimators of the Binary Choice and the Censored Regression Models

Lower bounds are derived for the asymptotic variances of regular distribution-free (or semiparametric) estimators of the parameters of the binary-choice model and the censored-regression (Tobit) model. A semiparametric estimator is one that does not require any assumption about the distribution of the stochastic error term in the model, apart from regularity conditions. Comparison of the bounds with the corresponding asymptotic Cramer-Rao bounds for the classical parametric problem shows the loss of information due to lack of *a priori* knowledge of the functional form of the error distribution.

*Econometrica*, May 1987, 55(3), pp. 559-86. University of Florida.

Duncan, Gregory M.—A Simplified Approach to *M*-Estimation with Application to Two-Stage Estimators

This paper presents a simple version of the theory of *M*-estimation. It is argued that the theory is immediately applicable to almost all estimation schemes employed by econometricians. It is further argued that the great overlooked benefit of the theory is that it provides almost automatic asymptotic results, e.g. probability limits and asymptotic covariances. Thus, one need not be a theoretical econometrician to invent and use specially tailored estimators. To illustrate its use the theory is applied to a variety of theoretical and applied problems. Particular attention is paid to two-step estimators. *J. Econometrics*, Mar. 1987, 34(3), pp. 373-89. Washington State University.

Florens, Jean-Pierre and Mouchart, Michel—Exhaustivité, ancillarité et identification en statistique bayésienne (Sufficiency, Ancillarity and Identification in Bayesian Statistics)

A Bayesian experiment is defined by a unique probability on the product of the parameter space and the sample space. This joint probability determines a conditional independence relation which is used for a symmetrical analysis of sufficiency and ancillarity on the parameter and the sample. Identification is then considered as a property of minimal sufficiency on the parameter space. These concepts are extended to conditional models and are shown to be suitable for a study of the exogeneity property in a coherent statistical framework. *Ann. Econ. Statist.*, Oct./Dec. 1986, (4), pp. 63-83 (French). EHESS and GREMAQ, University of Social Sciences, Toulouse; CORE, Catholic University of Louvain.

Courieroux, Christian, et al.—Generalised Residuals

This paper proposes a definition of generalized residuals for a large class of nonlinear econometric models. These residuals are shown to have properties similar to those of the familiar residuals in the linear model and to be useful in many hypothesis testing problems. *Comm.*

thors are Alain Monfort, Eric Renault, and Alain Trognon. *J. Econometrics*, Jan./Feb. 1987, 34(1/2), pp. 5-32. CEPREMAP, Paris.

**Gourieroux, Christian, et al.—Simulated Residuals**

Models deduced from a latent regression model by a nonlinear mapping are considered in this article. This class of models contains some well known limited dependent variable models such as the tobit, the probit, and disequilibrium models. In this context, some simulated residuals are defined. Those residuals play the same role as the usual residuals in linear models. They can be used with the standard regression packages for diagnostic checks or genuine statistical tests. Coauthors are Alain Monfort, Eric Renault, and Alain Trognon. *J. Econometrics*, Jan./Feb. 1987, 34(1/2), pp. 201-52. CEPREMAP, Paris.

**Hall, Alastair—The Information Matrix Test for the Linear Model**

The author derives the information-matrix test, suggested by H. White (1982), for the normal fixed-regressor linear model, and shows that the statistic decomposes asymptotically into the sum of three independent quadratic forms. One of these is White's general test for heteroscedasticity and the remaining two components are quadratic forms in the third and fourth powers of the residuals respectively. The results show that the test will fail to detect serial correlation and never be asymptotically optimal against heteroskedasticity, skewness, and non-normal kurtosis. *Rev. Econ. Stud.*, Apr. 1987, 54(2), pp. 257-63. North Carolina State University.

**Hausman, Jerry A. and Ruud, Paul A.—Specifying and Testing Econometric Models for Rank-ordered Data**

The rank-ordered logit model is used as the basic specification for rank-ordered consumer choice data. Two specification tests are proposed for this specification. The first is a Hausman specification test for the independence from irrelevant alternatives hypothesis. The second test examines the possibility that the estimates of equivalent prices are consistent.

Two alternative estimators are also proposed. One generalizes the rank-ordered logit specification to allow for a form of heteroscedasticity that permits top-ranked choices to be more precisely ranked than bottom-ranked choices. The other estimator is an application of a weighted *M*-estimator that yields consistent equivalent prices estimators despite any misspecification of the distribution in the rank-ordered logit model. *J. Econometrics*, Jan./Feb. 1987, 34(1/2), pp. 83-104. Massachusetts Institute of Technology; University of California, Berkeley.

**Hoffman, Dennis L.—Two-Step GLS Estimators in Multi-equation Generated Regressor Models**

Despite the critical analysis of Pagan (1984) and several subsequent applied studies, empirical models characterized by expectations are often estimated with "generated regressor" proxies that are treated as ordinary nonstochastic regressors. This paper offers a Generalized Least Squares estimator designed to cope with the nonscalar disturbance matrix precipitated by generated regressors. The approach is designed as a natural extension of Pagan's analysis and the author demonstrates how it may be applied to multi-equation models. Experimentation with numerical examples reveals the potential severity of ignoring the problem. These results also suggest an easily calculated indicator of potential inference distortion in models that fail to account for "generated regressors." *Rev. Econ. Statist.*, May 1987, 69(2), pp. 336-46. Arizona State University.

**Klepper, Steven and Stapleton, David C.—Consistent Sets of Estimates for Restricted Regressions with Errors in All Variables**

In the errors-in-variables model, positive semidefinite conditions on covariance matrices, together with sufficiently small prior limits on the severity of measurement error, imply that the set of feasible values for population coefficients is bounded. The authors show how maintained restrictions can be used to reduce further the set of feasible values for the coefficients. If the restrictions are incorrect, the restricted feasible set will be empty for sufficiently small limits on the severity of measurement error. Hence the restrictions are testable even though

coefficients are not identified. *Int. Econ. Rev.* 1987, 28(2), pp. 445-57. Carnegie University; Dartmouth College.

**John L.**—Predicting the Turning Points in Business and Economic Time Series

Standard linear least-squares prediction methods are not directly applicable to making probability statements about time series turnings. William F. Wecker suggested a method for extending the least-squares technique to allow computation of the probability distribution of turning points of a time series. Wecker's analysis was univariate and did not consider all sources of uncertainty (i.e., estimation coefficients). The primary purpose of the paper is fourfold: (1) to extend Wecker's method to the case of the multiple time-series; (2) to consider most sources of model uncertainty; (3) to test the procedure for reliability (method of calibrations); and (4) to demonstrate interesting applications. *J. Bus.*, 1987, 60(2), pp. 201-38. University of Virginia.

**Jung-Fei**—Non-parametric Testing of Finite Panel Data Models

Stochastic structures of the homogeneous Markov process, the heterogeneous Markov process, the Markov chain, and the homogeneous Markov chain are analyzed within a discrete panel data framework. A general theoretical and computationally tractable framework to test the stochastic structures is provided. The testing framework is nonparametric in nature, can incorporate the presence of time-varying exogenous variables, and can be extended to the general polychotomous regressions. Asymptotically optimal tests can be easily implemented. The LM tests for the stochastic structures are simply to test certain normality conditions with residuals. *J. Econometrics*, Jan./Feb. 1987, 34(1/2), pp. 147-167. University of Minnesota.

**Jan R.**—The Exact Moments of a Quadratic Form in Normal Variables  
Exact moments of  $x'Ax/x'Bx$  are obtained, where  $x$  is a normally distributed vector with mean (possibly nonzero) and positive definite

covariance matrix,  $A$  is symmetric and  $B$  is positive semidefinite. These moments appear as simple integrals which can be evaluated numerically in a straightforward manner. In addition, the precise conditions for the existence of the moments are found. Some related results are also reported. *Ann. Econ. Statist.*, Oct./Dec. 1986, (4), pp. 95-109. London School of Economics.

**McDonald, James B. and Butler, Richard J.**—Some Generalized Mixture Distributions with an Application to Unemployment Duration

Compounding or mixture distributions provide a rich class of models for applications ranging from models of heterogeneity, measurement error, distribution of stock returns and income to models of unemployment duration. Some very general mixtures are considered which include many new mixture models and also provide a unified method of organizing and comparing previously considered models as well as a test of heterogeneity. These models are used to analyze CPS unemployment duration data. A heterogeneity interpretation of the mixture models explains the discrepancy between implications of search theory and patterns observed in aggregate unemployment data. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 232-40. Brigham Young University.

**McFadden, Daniel**—Regression-based Specification Tests for the Multinomial Logit Model

Diagnostic tests for omitted variables or functional misspecification in the multinomial logit model can be performed conveniently by testing the significance of auxiliary regression of residuals on included and excluded variables. In particular, Lagrange Multiplier and Hausman-McFadden tests of the Independence from Irrelevant Alternatives property of the multinomial logit model can be carried out by the regression method using suitably defined excluded variables. Using this method, it is straightforward to test jointly against several sources of misspecification, and to diagnose the structure of deviations from the multinomial logit model. *J. Econometrics*, Jan./Feb. 1987, 34(1/2), pp. 63-82. Massachusetts Institute of Technology.

**Newey, Whitney K.**—Specification Tests for Distributional Assumptions in the Tobit Model

The recent development of distribution robust estimators for the censored regression model allows for the construction of specification tests of the normality and homoskedasticity assumption of the Tobit model. This paper considers J. Hausman (1978) specification tests for the Tobit model that are based on J. L. Powell's (1986) symmetrically censored least squares estimator. Testing for models with explanatory variables that are endogenous is considered, as well as the simpler case where the explanatory variables are exogenous. Testing of the maintained conditional symmetry assumption of the symmetrically censored least-squares estimator is also considered. The tests are implemented in an empirical example of a model of female labor supply. *J. Econometrics*, Jan./Feb. 1987, 34(1/2), pp. 125-45. Princeton University.

**Rouault, Jacques and Capy, Pierre**—Comment évaluer un nombre de catégories par échantillonnage (Estimating the Number of Categories by Sampling)

This paper describes a method for estimating the number of categories in an urn of unknown composition. From *a priori* values for the number and frequencies of categories, it is possible to calculate a sampling error and to estimate the number of individuals to draw which would be necessary for decreasing this error beyond a given risk. Successive ~~papers~~ lead to a convergence towards a convenient representation of the urn, in agreement with the fixed risk. *Ann. Econ. Statist.*, Oct./Dec. 1986, (4), pp. 111-24 (French). CNRS, Paris.

**Smith, Richard J.**—Testing the Normality Assumption in Multivariate Simultaneous Limited Dependent Variable Models

A score-test diagnostic for multivariate non-normality expressed as a multivariate Edgeworth distribution truncated at the fourth order is presented for a multivariate simultaneous-equations system in normally-distributed latent variables subject to a general censoring scheme. The score test involves third- and fourth-order multivariate conditional moments of the struc-

tural system's disturbance terms given the censoring scheme evaluated at the null hypothesis maximum likelihood estimator. The information-matrix test statistic, also given, is a score test for multivariate nonnormality and particular forms of multivariate heteroskedasticity and heterocliticity. Alternative  $C(\alpha)$  tests based on CAN estimators are also suggested. *J. Econometrics*, Jan./Feb. 1987, 34(1/2), pp. 105-23. University of Manchester.

**Terza, Joseph V.**—Estimating Linear Models with Ordinal Qualitative Regressors

The theory and application of ordinal qualitative dependent variable models have been given considerable attention in the social science and statistical literature. Linear models with ordinal qualitative regressors have, however, been neglected. In this paper, a simple specification for such models is developed and a consistent asymptotically normal estimator is offered. The estimator is compared to the conventional dummy-variable approach using simulated data. The simulation results indicate that substantial gains with regard to bias and efficiency can be achieved relative to estimation using a conventional dummy-variable scheme. Said gains appear to increase as the number of ordinal categories increases. The asymptotic properties of the estimator are detailed in the appendices. *J. Econometrics*, Mar. 1987, 34(3), pp. 275-91. University of Georgia.

**Tse, Y. K.**—A Note on Sargan Densities

This note reconsiders the general class of Sargan densities studied by S. M. Goldfeld and R. E. Quandt (1981) and S. Missiakoulis (1983) in the context of approximating normal densities in regression models. Some errors in these papers are pointed out and the Sargan densities are recomputed. To the contrary of Missiakoulis's conclusion, the first two order densities are not the best choice. Higher-order densities are better approximations, though the best choice appears to be the second-order density based on the Goldfeld-Quandt criteria. *J. Econometrics*, Mar. 1987, 34(3), pp. 349-54. National University of Singapore.

**Wills, Hugh**—A Note on Specification Tests for the Multinomial Logit Model

Choice probabilities generated by D. McFadden's (1973) random utility model are both multinomial logit and have the Independence of Irrelevant Alternatives (IIA) property. Various authors have suggested specification tests of this property. This paper identifies the alternative tests which these tests are constructed and compares classical specification tests. It is shown that both the null hypothesis and local asymptotic power of the classical tests is the same as a proposed Hausman test. Finally the discussion throws some light on the nature of the IIA property and on the performance of the logit model in applications where one would expect the IIA property to be violated but where the alternative set is fixed. *J. Econometrics*, Jan./Feb. 1987, 34(1/2), pp. 263-74. London School of Economics.

#### Construction, Analysis, and Use of Econometric Models

McFadden, Trudy Ann and James, Michelle D.—Efficient Estimation Methods for "Closed-ended" Contingent Valuation Surveys

"Closed-ended contingent valuation" surveys can be very useful in the evaluation of non-market resources. Respondents merely state whether they would accept or reject a hypothetical threshold amount, either as payment for giving up access to the resource or as a fee for use. The authors develop a maximum likelihood procedure which exploits the variation in threshold values to allow direct and separate point estimates of regression-like slope coefficients and error standard deviations (without location bias). Their illustration uses data from a survey of recreational fishermen to examine factors which influence individuals' willingness-to-pay. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 269-76. University of California, Los Angeles; Department of Fisheries and Oceans, Canada.

Mar, E. Miné—The Sensitivity of Extended Linear Expenditure System Household Scales to Income Declaration Errors

Extended Linear Expenditure System (ELES) household scales use the income variable of the household in identifying a system of Engel curves. Income data in household sur-

veys may contain declaration errors which result in the errors-in-variables problem. A composite error distribution, which incorporates both measurement and declaration errors into the model, is proposed and the ELES scales are reestimated. They are found to be sensitive to income declaration errors and biased measures of household welfare. *J. Econometrics*, Mar. 1987, 34(3), pp. 361-72. Loyola University.

#### Kulatilaka, Nalin—The Specification of Partial Static Equilibrium Models

In conducting an investigation into the specification of partial static equilibrium factor demand models, this paper isolates: (1) the endogeneity of output and quasi-fixed factor levels; (2) the choice of omitted share equation; and (3) the presence of serial correlation (when using time series data) as the specification issues that most affect the existing empirical literature. The impact of specification changes are studied via a series of experiments conducted on an illustrative data set and are found to have significant effects on: parameter estimates and model diagnostics; departures between observed and full equilibrium levels of quasi-fixed factors; and price elasticities. As a consequence, caveats must be attached to several previous studies and care must be taken by future researchers in addressing using such models. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 327-35. Boston University.

#### Kumbhakar, Subal C.—The Specification of Technical and Allocative Inefficiency in Stochastic Production and Profit Frontiers

This paper develops techniques for the estimation of technical and allocative inefficiency using the stochastic frontier production methodology under the behavioral assumption of the median profit maximization. Specification and estimation issues are discussed in a single cross-section as well as panel-data framework using the Cobb-Douglas production function. Consistency of the estimates of technical inefficiency is proved in the context of panel data (as  $T$  tends to infinity) when technical inefficiency is distributed as half normal or truncated normal. *J. Econometrics*, Mar. 1987, 34(3), pp. 335-48. University of Texas at Austin.

**Ransom, Michael R.**—A Comment on Consumer Demand Systems with Binding Non-negativity Constraints

For consumer-demand systems derived from a quadratic utility function, the Kuhn-Tucker conditions for utility maximization subject to non-negativity constraints can be modeled as a system of linear simultaneous equations with limited dependent variables. Such systems are "internally consistent" if they have unique solutions. This paper shows that concavity of the utility function guarantees the internal consistency of the associated simultaneous equation system with limited dependent variable. *J. Econometrics*, Mar. 1987, 34(3), pp. 355-59. University of Arizona.

## 220 ECONOMIC AND SOCIAL STATISTICAL DATA AND ANALYSIS

### 221 National Income Accounting

**Greenwood, Michael J. and Ladman, Jerry R.**—Intertemporal and Intersectoral Aspects of Income Distribution in Mexico

This paper describes and analyzes sector and state income inequality in Mexico in 1960 and 1970. During the rapid economic growth of the 1960s, Mexico's economy experienced significant structural transformation. The distribution of income, however, did not improve during the decade, the poorest states having considerably more inequality in each sector. This study clearly shows that public policy has affected the distribution of Mexican income, expenditures for social overhead investment resulting in a movement toward greater equality, but agricultural expenditures, chiefly for irrigation, contributing to increased inequality within the agricultural sector. *Rev. Soc. Econ.*, Apr. 1987, 45(1), pp. 48-63. University of Colorado; Arizona State University.

**Stollar, Andrew J.; Grubaugh, Stephen G. and Thompson, G. Rodney**—Utilisation of Direct and Indirect Estimates of Real GDP Per Capita: Implications of the Errors in the Variables Model

Several professional journals have presented the results of a series of recent studies on the nature and form of the relationship between real income per capita (purchasing-power-parity adjusted) and nominal income (exchange-

rate adjusted). This paper extends that analysis by applying the errors-in-the-variables model, a technique that allows for estimation of the asymptotic parameter bias that exists when using either a mixed vector of direct and indirect real GDP estimates or a nominal income vector. Statistical concerns about the form of the equation used to generate indirect estimates are also presented. *Econ. J.*, June 1987, 97(386), pp. 468-78. Bentley College; Bentley College; Virginia Polytechnic Institute and State University.

### 226 Productivity and Growth: Theory and Data

**Román, Zoltán**—Productivity Growth and Its Slowdown in the Hungarian Economy

International comparison shows that in the last fifteen to twenty years the growth of productivity in Hungary was about average relative to the developed Western countries, the developing countries, and the European socialist countries, while its slowdown after 1979 was slower than average. At the same time, the technological standards of products and production, as well as the structural adjustment of industry, are unsatisfactory and the international competitiveness of the industry is weakening. These are the main causes of the deceleration in the growth of productivity. *Acta Oecon.*, 1985, 35(1-2), pp. 81-104. Institute of Industrial Economics, Hungarian Academy of Sciences, Budapest.

### 227 Prices

**Domberger, Simon**—Relative Price Variability and Inflation: A Disaggregated Analysis

Relative price variability has been studied at the cross-sectional (intermarket) level. This paper addresses the equally important phenomenon of intramarket variability: the dispersion of commodity price movements around the industry average. Using quarterly price data for eighty disaggregated commodity groups in the United Kingdom from 1974 to 1984, the paper investigates the determinants of intramarket price variability and replicates some previous cross-sectional tests for the United Kingdom. Intramarket price variability is found to be positively related to inflation. Intramarket variability is found to be positively related to the average (market) rate of price change. *J. Polit.*

## Selected Abstracts

on., June 1987, 95(3), pp. 547-66. London Business School and University of Sydney.

**oyen, Richard T. and Waud, Roger N.**—An Examination of Aggregate Price Uncertainty in Four Countries and Some Implications for Real Output

This study constructs measures of aggregate price uncertainty for four countries (Canada, West Germany, Great Britain, and the United States) and examines the relationship across countries and through time between the inflation rate, inflation variability, and measures of price uncertainty. The results suggest that: the higher and more variable inflation of the 1970s increased uncertainty about the aggregate price level in Canada, Great Britain, and the United States, but not West Germany; and there was significant negative output effect of aggregate price uncertainty for Canada and the United Kingdom, but not for the United States or West Germany. *Int. Econ. Rev.*, June 1987, 28(2), pp. 353-72. University of North Carolina.

**bbons, Elizabeth and Halpin, Gerald F.**—Import Price Declines in 1986 Reflected Reduced Oil Prices

Price developments discussed in this article are based on data from the Bureau of Labor Statistics' International Price Program which produces import and export price indexes based on the Standard Industrial Classification scheme. Both indexes use a modified Laspeyres formula. Price data are collected for more than 1,000 products, and are not seasonally adjusted. Import price indexes are weighted by the 1980 Tariff Schedule of the United States annotated. Export price indexes are weighted by the 1980 Schedule B classification system of the U.S. Bureau of the Census. *Mon. Lab. Rev.*, Apr. 1987, 110(4), pp. 3-17. Bureau of Labor Statistics, Washington, D.C.

**well, Craig, Burns, Roger and Clem, Andrew**—Sharp Drop in Energy Prices Holds Inflation in Check during 1986

This article examines price changes for major components of the Consumer Price Index and the Producer Price Index. A slight increase in consumer prices was a contrast to the economy of the 1970s, when double-digit price increases were common. Furthermore, producer prices actu-

ally fell across a broad front for the first time since the early 1960s. The continuing decline in energy prices resulted in the Consumer Price Index advancing only 1.1 percent during the twelve-month period ending in December. The finished goods price index turned lower for the first time since 1963, declining 2.5 percent. *Mon. Lab. Rev.*, May 1987, 110(5), pp. 3-9. Bureau of Labor Statistics, Washington, D.C.

### 300 Domestic Monetary and Fiscal Theory and Institutions

#### 310 DOMESTIC MONETARY AND FINANCIAL THEORY AND INSTITUTIONS

**Sarcinelli, Mario**—Determinants and Trends of Italian Financial Policy

After assessing the developments in the Italian financial market, the conclusion is reached that financial innovation has been the offspring of high and variable inflation, bulging budget deficits, volatility of interest rates, and direct credit controls. Thus innovation has been fostered more by the authorities than by the market. Atypical or nonstandard securities developed by enterprising operators failed to consolidate themselves because of the lack of a secondary market. Two other determinants of financial policy across countries, i.e. deregulation and privatization, fared poorly in Italy in recent years. As regards fair-play regulation of financial markets, the trend has been upward. Privatization has been piecemeal and has not yet forced its way into Government's priorities. *Banca Naz. Lavoro Quart. Rev.*, Mar. 1987, 40(160), pp. 3-29. Ministero del Tesoro, Rome.

**Serletis, Apostolos and Robb, A. Leslie**—Divisia Aggregation and Substitutability among Monetary Assets

In this paper the authors estimate the degree of substitutability among the services of money, checkable deposits, savings deposits, and time deposits in a quasi-homothetic translog utility framework for Canada. The four composites mentioned are formed by aggregating more basic assets such as checkable deposits at banks, checkable deposits at trust companies, etc. Traditionally the simple-sum aggregation has been used in this context. The authors investigate

both this alternative and Divisia aggregation of the assets. They find a low degree of substitution among the services of monetary assets and provide some evidence favoring Divisia aggregation over simple-sum aggregation. *J. Money, Credit, Banking*, Nov. 1986, 18(4), pp. 430-46. University of Calgary; McMaster University, Canada.

### 311 Domestic Monetary and Financial Theory and Policy

**Bester, Helmut**—The Role of Collateral in Credit Markets with Imperfect Information

This paper analyzes the structure of credit-market equilibrium under imperfect information. Collateralization and credit rationing are compared as alternative means to cope with problems of adverse selection and moral hazard. It is shown that lenders may use collateral as a self-selection and incentive mechanism. Rationing occurs only if the borrowers' collateralizable wealth is too small to allow perfect sorting or to create sufficiently strong incentives. Whenever there is rationing in an equilibrium, some borrowers are charged the maximum amount of collateral. *Euro. Econ. Rev.*, June 1987, 31(4), pp. 887-99. University of Bonn.

**Blanchard, Olivier J. and Summers, Lawrence H.**—Pourquoi les taux d'intérêts sont-ils aussi élevés (Perspectives on High World Real Interest Rates)

This paper examines the reasons for the dramatic increase in real interest rates in the world economy observed over the 1978 to 1984 period. The authors find little evidence to suggest that budget deficits can be blamed for the increase in worldwide real interest rates. The structural inflation-adjusted budget deficit of the major OECD nations has not changed appreciably since 1978. Rather, the authors are led to explain high real interest rates in terms of the combined effect of tight monetary policies and the increased attractiveness of investment. The importance of the latter factor is evidenced by the strong performance of stock markets and investment around the world in the face of high real interest rates. *Ann. Econ. Statist.*, July/Sept. 1986, (3), pp. 53-100 (French). Massachusetts Institute of Technology; Harvard University.

**Bordo, Michael D.; Choudhri, Ehsan U. and Schwartz, Anna J.**—The Behavior of Money Stock under Interest Control: Some Evidence for Canada

A widely held view of interest rate control is that under this policy the demand for *M1* determines the behavior of the stock of *M1*. An alternative view is that under interest rate control the supply function of *M1* is the residual quantity determined by the banking system given the levels of bank credit and nontransaction deposits chosen by the nonbank public. The authors find evidence in favor of the alternative view for the Canadian case, 1970-84. *J. Money, Credit, Banking*, May 1987, 19(2), pp. 181-97. University of South Carolina; Carleton University, Canada; National Bureau of Economic Research.

**Chan, Yuk-Shee and Thakor, Anjan V.**—Collateral and Competitive Equilibria with Moral Hazard and Private Information

The authors examine equilibrium credit contracts and allocations under different competitiveness specifications, and explain the economic roles of collateral under these specifications. Both moral hazard and adverse selection are considered. The principal message is that how a competitive equilibrium is conceptualized significantly affects the characterization of equilibrium credit contracts. Specifically, some well known results in the rationing literature are shown to rest delicately on the adopted equilibrium concept. Two somewhat surprising results emerge. First, high-quality borrowers with unlimited collateral may be priced out of the market despite the bank having idle deposits. Second, high-quality borrowers may put up more collateral. *J. Finance*, June 1987, 42(2), pp. 345-63. Northwestern University and University of Southern California; Indiana University.

**Cosimano, Thomas F.**—Reserve Accounting and Variability in the Federal Funds Market

The federal-funds market is analyzed under the reserve accounting procedures suggested by Robert D. Laurent (1979) and William Poole (1976). In general, it is shown that the forecast error for the federal-funds rate is smaller when the uncertainty arises from future random

shocks. However, the current forecast error for the demand for money has an ambiguous impact on the forecast error for the federal-funds rate under Laurent or Poole's procedure. *J. Money, Credit, Banking*, May 1987, 19(2), pp. 198-209. Texas A&M University.

Cowen, Tyler and Kroszner, Randall—The Development of the New Monetary Economics

This paper looks into the history of economic thought to examine the forerunners of the "new monetary economics." This approach emphasizes the role of regulations on private financial intermediation in determining the particular institutional arrangements that contemporary monetary theory treats as data. The "new view" investigates the possibility that under *laissez-faire* the unit of account and means of payment, traditionally bundled together in the item called "money," may become separated. The earlier writers who share this perspective have been overlooked by historians of economic thought as well as by recent contributors to the new monetary economics. Many of the insights of these theorists are relevant to modern monetary theory. *J. Polit. Econ.*, June 1987, 95(3), pp. 567-90. Harvard University.

Feltenstein, Andrew and Farhadian, Ziba—Fiscal Policy, Monetary Targets, and the Price Level in a Centrally Planned Economy: An Application to the Case of China

This paper presents a planned-economy monetary model of China. A money supply equation links changes in broad money to government transactions evaluated at official prices. The demand for real money balances by consumers equals the nominal demand for money deflated by an unobserved true price index. The model explains money demand as the divergence between the then official and true price indices. Changes in the money supply are explained by government transactions, while money demand is explained by real income and the anticipated true rate of inflation. The true rate of inflation is 2.5 times the official rate. *J. Money, Credit, Banking*, May 1987, 19(2), pp. 137-56. University of Kansas; International Monetary Fund, Washington, D.C.

Gochoco, Maria S.—Tests of the Money Neutrality and Rationality Hypotheses: The Case of Japan 1973-1985

This study examines the Macroeconomic Rational Expectations Hypothesis for Japan in the period 1973-1985. Monthly, seasonally-unadjusted data and the empirical methodology utilized by Frederic S. Mishkin (1982) are used to test the hypotheses of money neutrality and rationality of expectation formation jointly and separately. Two alternative methods of inducing stationarity in the output data are employed. The tests reject the joint hypotheses of money neutrality and rationality as well as the separate hypothesis of money neutrality. The separate hypothesis of rationality cannot be rejected. *J. Money, Credit, Banking*, Nov. 1986, 18(4), pp. 458-66. University of Hawaii at Manoa.

Goodhart, C. A. E.—Why Do Banks Need a Central Bank?

The conventional view is that the joint provision of payments' services together with portfolio management functions by banks exposes the monetary system to contagious failure, which a Central Bank should prevent. The author argues, however, that the joint provision of payments' services and portfolio management could be safely conducted by mutual collective investment intermediaries without such Central Bank support, and that current technological changes are making this latter development more widespread. The vulnerability of banks lies, instead, primarily in the special nature of their assets, largely nonmarketable, fixed nominal-value loans of uncertain true worth. *Oxford Econ. Pap.*, Mar. 1987, 39(1), pp. 75-89. London School of Economics.

Hardouvelis, Gikas A.—Reserves Announcements and Interest Rates: Does Monetary Policy Matter?

The author provides evidence on the perceived existence of a strong liquidity effect. The analysis is based on the response of the term structure of interest rates to the weekly Federal Reserve announcements of bank reserves during the post-October 1979 time period. It is shown that unanticipated changes in the mix between borrowed and non-borrowed reserves

cause expected real interest rates to change after the announcement because they provide information about a future change in the supply of money. A precise model is developed and tested during subperiods of non-borrowed and borrowed reserve targeting by the Fed. *J. Finance*, June 1987, 42(2), pp. 407-22. Barnard College, Columbia University.

**Hoogduin, Lex**—On the Difference between the Keynesian, Knightian and the "Classical" Analysis of Uncertainty and the Development of a More General Monetary Theory

In this article it is shown that Keynes's concept of uncertainty is not identical with that of F. H. Knight, as is often argued. The identification of Keynesian with Knightian uncertainty has contributed to the neglect of an aspect of Keynesian uncertainty that is important in understanding the functioning of a monetary economy. Therefore, it is concluded that monetary theory can benefit from the development of an analytical apparatus that incorporates all aspects of Keynesian uncertainty. *De Economist*, 1987, 135(1), pp. 52-65. University of Groningen, the Netherlands.

**Kirchgässner, Gebhard**—Granger-Kausalität und Rationale Erwartungen

The concepts of rational expectations and Granger causality are described, showing that the Granger causality uses such expectations. Using models of T. J. Sargent and W. H. Buiter it is shown which conclusions about rational expectations and/or policy ineffectiveness can be drawn from the results of Granger causality tests, especially with respect to instantaneous Granger causality. The author concludes with three examples: the relation between money and income; the international interest rate linkage; and the relation between the perception of the general economic situation by voters and the popularity of the major German parties. *Kyklos*, 1987, 40(1), pp. 21-42 (German). FB Wirtschaftswissenschaften, Universität Osnabrück, Germany.

**Lucas, Robert E., Jr. and Stokey, Nancy L.**—Money and Interest in a Cash-in-advance Economy

The authors analyze an aggregative general equilibrium model in which the use of money

is motivated by a cash-in-advance constraint, applied to purchases of a subset of consumption goods. The system is subject to both real and monetary shocks, which are economy-wide and observed by all. They develop methods for verifying the existence of, characterizing, and explicitly calculating equilibria. *Econometrica*, May 1987, 55(3), pp. 491-514. University of Chicago; Northwestern University.

**Mankiw, N. Gregory and Summers, Lawrence H.**—Money Demand and the Effects of Fiscal Policies

This paper reexamines the choice of the scale variable in the money-demand function. A variety of evidence suggests that consumer spending is a better scale variable than GNP. Changing the money-demand specification along these lines can profoundly affect the standard Keynesian analysis of a tax cut. *J. Money, Credit, Banking*, Nov. 1986, 18(4), pp. 415-29. Harvard University and National Bureau of Economic Research.

**Marini, Giancarlo**—Information Structure and Policy Effectiveness

This paper shows that lagged-feedback rules dominate instantaneous-feedback rules in rational-expectations models where agents are differentially informed across markets. The economic reason is that better-informed agents can disentangle the effects of future anticipated policy responses implied by current lagged-feedback rules, while instantaneous-feedback rules give no indication whatsoever about the future course of policy to any agent. *Econ. Notes*, 1986, (2), pp. 5-16. London School of Economics.

**Molho, Lazaros E.**—Selective Credit Controls in Greece: A Test of Their Effectiveness

This paper analyzes the effectiveness of policies to stimulate fixed investment by selectively increasing the supply of long-term credit and by reducing its cost. Through a model of a firm's investment and financing decisions, the paper shows that firms may neutralize the effects of such policies by changing their financing patterns. Empirical analysis suggests that Greek industrial firms indeed tended to offset the relative contraction of short-term credit during

1973-74 by diverting a greater share of long-term and internal funds to finance working capital, while using a smaller share of these funds to finance fixed capital. *Int. Monet. Fund Staff Pap.*, Sept. 1986, 33(3), pp. 477-508. International Monetary Fund, Washington, D.C.

**Montiel, Peter J.—An Optimizing Model of Household Behavior under Credit Rationing**

This paper uses an intertemporal optimizing model to examine household behavior in a world in which bank credit is rationed and households have no additional sources of finance other than their own savings. It is shown that, given the household rate of time preference, the demand for capital is unaffected in the long run by changes in the availability of bank credit or in either deposit or loan interest rates. These measures do affect the demand for capital in the short run and the entire time paths of both consumption and money demand. *Int. Monet. Fund Staff Pap.*, Sept. 1986, 33(3), pp. 583-615. International Monetary Fund, Washington, D.C.

**Paleologos, John—Unanticipated Money, Output, and Inflation in Greece**

This paper develops and estimates a small new-classical model of the Greek economy using annual data from 1954 to 1980. The model is "monetarist" as the demand for output is derived from the demand for money function. In this model output is affected only by actual and anticipated monetary growth, whereas the price level is influenced by both actual and unanticipated changes in money supply, using single equation and simultaneous equation techniques. *Public Finance*, Dec. 1986, 41(3), pp. 415-29. Piraeus Graduate School of Industrial Studies, Greece.

**Patterson, Kerry David—The Specification and Stability of the Demand for Money in the United Kingdom**

This article reports a dynamic demand for money function specified in differences-plus-dis-equilibrium form, with direct estimates of the static long-run coefficients and their "t" statistics. Unit elasticity assumptions on prices and income are tested. The recursive residuals form is used to test the temporal stability of

the coefficients; and the results are contrasted with previous work. The article concludes that there is evidence that lags in monetary relations have become shorter in the 1970s. *Economica*, Feb. 1987, 54(213), pp. 41-55. University of Reading and the Bank of England.

**Postlewaite, Andrew and Vives, Xavier—Bank Runs as an Equilibrium Phenomenon**

A standard demand-deposit contract in which individuals are entitled to their full deposit at any time provided the bank is solvent is analyzed in a context in which there are no exogenous events on which agents condition their behavior and a unique equilibrium involving a bank run with positive probability is shown to exist. *J. Polit. Econ.*, June 1987, 95(3), pp. 485-91. University of Pennsylvania.

**Richards, Daniel J.—Unanticipated Money and the Political Business Cycle**

Six different series of one-period forecasts for money growth are generated for each year, 1960 through 1984. The prediction errors are analyzed to see whether the authorities attempted to expand the economy in election years by unexpectedly raising money growth. While there is no evidence of attempts to fool the public throughout the entire 1960-84 period, such fooling may have been tried through 1974. It is speculated that the public discussion of expectations formation and of politicians' motivations since then may have signaled officials that further attempts to mislead the public would be prohibitively costly. *J. Money, Credit, Banking*, Nov. 1986, 18(4), pp. 447-57. Tufts University.

**Sephton, Peter S.—The Choice of Monetary Policy Instruments in Canada: An Extension**

W. Poole (1970) and Gordon Sparks (1979) used fixed-price models to examine the relative merits of various monetary policy instruments. This paper extends the discussion to a flex-price model. It illustrates that bank reserve accounting systems have no effect on the choice of interest-rate or exchange-rate instruments. The author shows that income is sheltered from

*financial innovation when a reserve instrument is used in conjunction with lagged reserve accounting.* *Can. J. Econ.*, Feb. 1987, 20(1), pp. 55-60. University of New Brunswick.

**Simos, Evangelos O. and Triantis, John E.—**  
The Effect of Structural Instability on the Demand for Money Forecast

Previous empirical works attempt to explain the downward shift of the demand for money since 1975 by including alternative explanatory variables which produce marginally better results in an OLS environment. Using varying parameter regression models, it is shown that OLS results are misleading because the shift in the demand for money is not captured by constant-coefficient models. Static and dynamic varying parameter regression forecasts are superior to OLS forecasts and appear to resolve the missing money puzzle. *Econ. Notes*, 1986, (2), pp. 43–61. University of New Hampshire; AT&T-Communications, Morristown, New Jersey.

**Sumner, Michael T. and Ward, Robert—**  
Nonlinear Estimates of the UK Phillips Curve

A spline function is used to estimate an expectations-augmented Phillips curve, in order to allow a discontinuity in the relationship between unemployment and wage inflation. A kink is found to occur at an unemployment rate just above the "natural" level: at higher rates of unemployment the partial Phillips curve is essentially horizontal. The Implication of these results is that the severely deflationary policies pursued in the United Kingdom during the 1980s are highly inefficient. *Econ. Notes*, 1986, (2), pp. 62–67. University of Sussex; University of Salford, United Kingdom.

**Sundararajan, V.—The Debt-Equity Ratio of Firms and the Effectiveness of Interest Rate Policy: Analysis with a Dynamic Model of Saving, Investment, and Growth in Korea**

This paper analyzes empirically the linkage between interest rates, the debt-equity ratio of firms, the overall cost of capital, savings, investment, and growth in the Korean economy during 1963–81. The interdependence between the financing and real decisions is explicitly modeled. Estimates show that the overall cost of capital is U-shaped, first falling and then rising as the debt-equity ratio rises, and this relationship has far-reaching implications for the effectiveness of interest-rate policy. In particu-

lar, model simulations reveal that in recent years, owing to high corporate debt, the effectiveness of interest-rate policy has been substantially weakened. *Int. Monet. Fund Staff Pap.*, June 1987, 34(2), pp. 260–310. International Monetary Fund, Washington, D.C.

**Turnovsky, Stephen J.—Supply Shocks and Optimal Monetary Policy**

This paper demonstrates that if current shocks are observed instantaneously, output can be stabilized perfectly for completely general supply disturbances, using simple monetary rules based only on: (1) the current shock; (2) the previous forecast of the current shock; and (3) the forecast for just one period ahead. The optimal rule can be expressed in an infinite number of ways and various alternatives are considered. With optimal wage indexation, the monetary rule is even simpler. If current shocks are not observed instantaneously, but are inferred from other signals, the optimal rules are of the same form, with the current perceived disturbance replacing the actual. *Oxford Econ. Pap.*, Mar. 1987, 39(1), pp. 20–37. University of Illinois and National Bureau of Economic Research.

**Viren, Matti E. E.—Examining the Long-run Relationship between Interest Rates and Inflation: Some Cross-country Evidence**

This paper analyzes the magnitude of the long-run effect of anticipated inflation on nominal interest rates. The analysis makes use of alternative measures of anticipated inflation and of dynamic model specifications as well as of some cointegration test procedures. Empirical results with cross-country data from eleven countries covering the period 1873–1984 indicate that a Fisher-hypothesis-type relationship does indeed hold in the long run, but that the relationship is rather imprecise and the "adjustment periods" are very long. *Econ. Notes*, 1986, (3), pp. 122–33. University of Helsinki, Finland.

### 312 Commercial Banking

**Rhoades, Stephen A.—The Effect of Nonbank Thrift Institutions on Commercial Bank Profit Performance in Local Markets**

Nonbank thrift institutions have been given new powers that make them technically closer competitors of commercial banks. This article uses a standard structure-performance model to determine whether a Herfindahl index measure of market structure, modified to account for nonbank thrifts, is a more powerful variable for explaining commercial bank profit performance than a Herfindahl index based on banks only. Tests covering 335 local markets for 1978-82, 1978-79, and 1981-82 indicate the Herfindahl index based on banks and thrifts performs no better than one based on banks only. This is a rather surprising result suggesting that generally nonbank thrifts do not greatly increase competition faced by commercial banks. *Quart. Rev. Econ. Bus.*, Spring 1987, 27(1), pp. 16-28. Federal Reserve Board, Washington, D.C.

**Udell, Gregory F.—Pricing Returned Check Charges under Asymmetric Information**

Consumer deposit pricing has recently been the subject of close public scrutiny. Banks have been accused of monopolistically setting fees for some of their deposit services at levels greater than associated costs. This paper examines consumer deposit pricing in a world characterized by imperfect information about a heterogeneous customer population. It is demonstrated that banks, in order to minimize an adverse selection problem, utilize a menu of pricing elements including NSF fees, minimum balance requirements, and deposit hold schedules. As a result, competitive banks may be deliberately overcharging for some component deposit services while simultaneously undercharging for others. *J. Money, Credit, Banking*, Nov. 1986, 18(4), pp. 495-505. New York University.

**313 Capital Markets**

**Allon, Paul R. and Sirmans, C. F.—An Analysis of Gains to Acquiring Firm's Shareholders: The Special Case of REITs**

This study uses capital market data to measure the effects of real estate investment trust mergers on the wealth of the acquiring trust's shareholders. A significant increase in shareholder wealth is detected. This differs from the findings of other acquisition studies. The pri-

mary source of the value gain seems to be improved management of the acquired trust's assets. *J. Finan. Econ.*, Mar. 1987, 18(1), pp. 175-84. Louisiana State University.

**Ariel, Robert A.—A Monthly Effect in Stock Returns**

The mean return for stocks is positive only for days immediately before and during the first half of calendar months, and indistinguishable from zero for days during the last half of the month. This "monthly effect" is independent of other known calendar anomalies, such as the January effect documented by others, and appears to be caused by a shift in the mean of the distribution of returns from days in the first half of the month relative to days in the last half. *J. Finan. Econ.*, Mar. 1987, 18(1), pp. 161-74. Baruch College, City University of New York.

**Barone-Adesi, Giovanni and Whaley, Robert E.—Efficient Analytic Approximation of American Option Values**

This paper provides simple analytic approximations for pricing exchange-traded American call and put options written on commodities and commodity futures contracts. These approximations are accurate and considerably more computationally efficient than finite-difference, binomial, or compound-option approximation methods. *J. Finance*, June 1987, 42(1), pp. 301-20. University of Alberta; Duke University.

**Bierwag, G. O.; Kaufman, George G. and Latta, Cynthia M.—Bond Portfolio Immunization: Tests of Maturity, One- and Two-Factor Duration Matching Strategies**

This paper provides additional evidence on the usefulness of duration as a strategy tool by developing a two-factor duration model and by using a reasonably reliable database to compare empirically the relative performance of maturity, one-factor duration, and two-factor duration matching strategies in immunizing portfolios of default-free and option-free bonds against interest-rate risk. The results suggest that, on average, duration models, even for arbitrarily assumed simple stochastic processes, are more

accurate than maturity models and that increased accuracy may be achieved by increasing the length of the planning period and the number of factors in the model. *Financial Rev.*, May 1987, 22(2), pp. 203-19. University of Arizona; Loyola University; DRI/McGraw-Hill, Lexington, Massachusetts.

**Booth, Laurence**—The Dividend Tax Credit and Canadian Ownership Objectives

This paper discusses the role of the dividend tax credit in determining the Canadian ownership pattern of Canadian industry. The analytic tool used is the capital-asset pricing model extended to include differential taxation of dividends and capital-gains income across different countries. The paper finds that changes in the dividend tax credit will have a differential impact on Canadian ownership, depending on sectoral differences in dividend yields and variances of rates of return, and the correlation structure. Empirical simulation of the model suggests that the effects are significant. *Can. J. Econ.*, May 1987, 20(2), pp. 321-39. University of Toronto.

**Borensztein, Eduardo R.**—Alternative Hypotheses about the Excess Return of Dollar Assets, 1980-84

This paper explores the empirical validity of two hypotheses that could help to explain—within the framework of efficient financial markets—why the returns on U.S. dollar-denominated assets exceeded so amply those of similar securities of different currency denomination between 1980 and 1985. These two hypotheses describe scenarios in which the exchange rate displays an asymmetric probability distribution: a "peso problem" model and a speculative bubble model. Both models are found to be consistent with the sample data. *Int. Monet. Fund Staff Pap.*, Mar. 1987, 34(1), pp. 29-59. International Monetary Fund, Washington, D.C.

**Chiang, Raymond**—Some Results on Bond Yield and Default Probability

Yield-to-maturity of corporate bonds and yield spreads have become common proxies for default risk. However, the default-risk problem is multi-dimensional. Given the market required rate of return, the payoff when default

occurs and the default probability jointly determine a bond's yield-to-maturity. Thus, direct implications from yield-to-maturity to default probabilities among individual bonds generally cannot be drawn. This paper examines the sufficient conditions for yield-to-maturity to be the proper ordering or proxy for bond default risk. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 1037-51. University of Miami.

**Cleeton, David L. and Reeder, Paul A.**—Stock and Option Markets: Are Insider Trading Regulations Effective?

While the theoretical debates on the role of insider trading continue and empirical evidence is gathered, little discussion has focused on the difficult problems of determining what behaviors by insiders are aligned with attempts to make profits or avoid losses on the basis of their information. In particular, option markets have been left out of most of the analysis of insider trading but offer trading opportunities that are at least as profitable as trading in common stock. This article examines the link between traded options and SEC enforcement practices against insider trading. *Quart. Rev. Econ. Bus.*, Spring 1987, 27(1), pp. 63-76. Oberlin College; Loomis, Sales and Company, Boston.

**Elton, Edwin J.; Gruber, Martin J. and Rentzler, Joel C.**—Professionally Managed, Publicly Traded Commodity Funds

Investment in professionally-managed, publicly-traded commodity funds has grown rapidly in recent years. This is the first comprehensive study of the performance of these funds. It is found that randomly selected funds offer neither an attractive alternative to bonds nor a profitable addition to a portfolio of stocks and bonds. Furthermore, past performance of these funds offers very little information about future performance. The findings may be explained by the large transactions costs incurred by these funds and their primary reliance on technical analysis. *J. Bus.*, Apr. 1987, 60(2), pp. 175-99. New York University; New York University; Baruch College.

**Ferson, Wayne E., Kandel, Shmuel and Stambaugh, Robert F.**—Tests of Asset Pricing

**with Time-Varying Expected Risk Premiums and Market Betas**

Tests of asset-pricing models are developed that allow expected risk premiums and market betas to vary over time. These tests exploit the relation between expected excess returns and current market values. Using weekly data for 1963-82 on ten common stock portfolios formed according to equity capitalization, a single risk-premium model is not rejected if the expected premium is time varying and is not constrained to correspond to a market factor. Conditional mean-variance efficiency of a value-weighted stock index is rejected, and the rejection is insensitive to how much variability of expected risk premiums is assumed. *J. Finance*, June 1987, 42(2), pp. 201-20. University of Chicago.

**Ferson, Wayne E. and Merrick, John J., Jr.—Non-stationarity and Stage-of-the-Business-Cycle Effects in Consumption-Based Asset Pricing Relations**

Empirical tests of Euler equations relating security returns and consumption usually appear to reject the model. Using a common specification of aggregate preferences and instrumental variables, this paper examines some potential reasons for rejections. The evidence indicates that maintained stationarity assumptions of previous tests fail for post-war U.S. quarterly and monthly data. Shifts in model parameters are found across policy regimes (pre-1951 and post-1979) and across states of the business cycle (recession versus non-recession). Controlling for some of these factors, less evidence is found against a simple consumption-based asset pricing model in non-recession periods. *J. Finan. Econ.*, Mar. 1987, 18(1), pp. 127-46. University of Chicago; New York University.

**Furtado, Eugene P. H. and Rozoff, Michael S.—The Wealth Effects of Company Initiated Management Changes**

The essence of corporate control includes the hiring and firing of key managers. The authors examine changes in equity values when the Board of Directors appoints and dismisses top-level managers. The evidence suggests that management changes signal shifts in company policy and raise shareholder wealth; internal

promotions confirm the soundness of investment by large companies in firm-specific human capital while external appointments do not; promotions occur more often than external appointments but decline in importance as firm size decreases; and dismissal is not a favored means to handle managerial underperformance but is associated with stock price increases when used. *J. Finan. Econ.*, Mar. 1987, 18(1), pp. 147-60. Kansas State University; University of Iowa.

**Glascok, John L.; Davidson, Wallace N., III and Henderson, Glenn V.—Announcement Effects of Moody's Bond Rating Changes on Equity Returns**

This paper examines stock-return behavior around the announcement date of a bond-rating change by Moody's Bond Service. Moody's data are used to clarify the announcement day. The results show that equity returns react around bond reratings. The reratings for downgrades appears to signal the end of a downward drift in equity residuals. Unexpectedly, the reaction is on the publication of the Bond Survey, not the wire service announcement day. *Quart. J. Bus. Econ.*, Summer 1987, 26(3), pp. 67-78. Louisiana Tech; North Texas State University; University of Cincinnati.

**Hansen, Lars Peter and Richard, Scott F.—The Role of Conditioning Information in Deducing Testable Restrictions Implied by Dynamic Asset Pricing Models**

The purpose of this paper is to investigate testable implications of equilibrium asset pricing models. The authors derive a general representation for asset prices that displays the role of conditioning information. This representation is then used to examine restrictions implied by asset pricing models on the unconditional moments of asset payoffs and prices. In particular, they analyze the effect of information omission on the mean-variance frontier of one-period returns on portfolios of securities. Also, the authors deduce an information extension of equilibrium pricing functions that is useful in deriving restrictions on the unconditional moments of payoffs and prices. *Econometrica*, May 1987, 55(3), pp. 587-613. University of Chicago; Carnegie-Mellon University.

**Heaton, Hal—The Relative Yields on Taxable and Tax-exempt Debt**

A valuation model for corporate tax liabilities is developed and used to derive a relationship for the relative yields of taxable and tax-exempt debt. The model incorporates both the incomplete tax loss offset of the U.S. corporate tax code and the resulting probabilistic marginal tax rate. The relationship is then tested using regression analysis; the results are both positive and strong. *J. Money, Credit, Banking*, Nov. 1986, 18(4), pp. 482–94. Brigham Young University.

**Hull, John C. and White, Alan D.—The Pricing of Options on Assets with Stochastic Volatilities**

One option-pricing problem which has hitherto been unsolved is the pricing of European call on an asset which has a stochastic volatility. This paper examines this problem. The option price is determined in series form for the case in which the stochastic volatility is independent of the stock price. Numerical solutions are also produced for the case in which the volatility is correlated with the stock price. It is found that the Black-Scholes price frequently overprices options and that the degree of overpricing increases with the time to maturity. *J. Finance*, June 1987, 42(2), pp. 281–300. York University, Toronto.

**Kandel, Shmuel and Stambaugh, Robert F.—On Correlations and Inferences about Mean-Variance Efficiency**

A framework is presented for investigating the mean-variance efficiency of an unobservable portfolio based on its correlation with a proxy portfolio. A sensitivity analysis derives the highest correlation between the proxy and a portfolio that reverses the inference of a test of Sharpe-Lintner tangency. For example, the maximum correlation between the value-weighted NYSE-AMEX portfolio and a portfolio inferred tangent ranges from 0.76 to 0.48. The authors also test whether the correlation between the proxy and the tangent portfolio exceeds a given level. This hypothesis is often rejected for the NYSE-AMEX proxy at a correlation of 0.7. *J. Finan. Econ.*, Mar. 1987, 18(1), pp. 61–90. University of Chicago.

**Larcker, David F. and Lys, Thomas—An Empirical Analysis of the Incentives to Engage in Costly Information Acquisition: The Case of Risk Arbitrage**

In order for security prices to be informationally efficient, incentives must exist for traders to engage in costly information acquisition. This paper provides empirical evidence on this proposition. The authors observe that risk arbitrageurs (i.e., market participants who trade in securities of firms that are involved in mergers, tender offers, and voluntary liquidations) are able to generate private information regarding the success or failure of corporate reorganizations. Moreover, risk arbitrageurs earn substantial returns on their trading activities. These results suggest that security prices are sufficiently noisy to create incentives for costly information acquisition. *J. Finan. Econ.*, Mar. 1987, 18(1), pp. 111–26. University of Pennsylvania; Northwestern University.

**Lehmann, Bruce N. and Modest, David M.—Mutual Fund Performance Evaluation: A Comparison of Benchmarks and Benchmark Comparisons**

The main goal in this paper is to gauge the sensitivity of conventional measures of abnormal mutual-fund performance to the benchmark chosen to measure normal performance. The authors employed standard CAPM benchmarks and a variety of APT benchmarks to investigate this question and found little similarity between the absolute and relative rankings implied by them. Hence, both the model for risk and return and the method used to construct the APT benchmark are important choices in this context. Finally, the authors found statistically significant measured abnormal performance using all benchmarks. The economic interpretation of this phenomenon appears to be an open question. *J. Finance*, June 1987, 42(2), pp. 233–66. Columbia University and National Bureau of Economic Research; Columbia University and University of California, Berkeley.

**McCulloch, J. Huston—The Monotonicity of the Term Premium: A Closer Look**

Eugene F. Fama's 1984 evidence that the term premium on Treasury securities is not

monotonically increasing is found to depend entirely on the behavior of bid-asked mean returns on nine- and ten-month bills, and only during the subperiod 8/64–12/72. When transactions costs, as reflected in the bid-asked spread, are taken into account, there is found to be no way to exploit this nonmonotonicity. The anomalous behavior of the quotations is attributed to the Treasury's auctions of nine-month bills during the period 9/66–10/72. The hypothesis that the term premium is a monotonically increasing function of maturity remains unrefuted. *J. Finan. Econ.*, Mar. 1987, 18(1), pp. 185–91. Ohio State University.

**McLaren, Keith R. and Upcher, Mark R.**—Testing Further Restrictions on Portfolio Models

Further sets of restrictions that can arise from the theory of portfolio models are examined. These are of two major classes: variance-covariance restrictions arising from explicit attention to the introduction of the error term, restrictions on the interest-rate response matrix which have not been fully accounted for in previous studies. Under certain assumptions a "reverse regression" procedure for estimation becomes more appropriate. A hierarchy of restrictions is developed, and estimation and testing are demonstrated using an empirical application. *Australian Econ. Pap.*, Dec. 1986, 25(47), pp. 193–205. Monash University, Australia; Department of Prime Minister and Cabinet, Canberra, Australia.

**Newbery, David M.**—When Do Futures Markets Destabilize Spot Markets?

Futures markets allow agents to shift price risk onto speculators and encourages them to take riskier decisions. Historically their main impact has been to encourage the storage of commodities, thus arbitraging prices over time and reducing price fluctuations. This paper presents a simple model in which opening futures markets in a nonstorable commodity encourages producers to choose riskier production techniques which destabilizes supply and hence the spot price. *Int. Econ. Rev.*, June 1987, 28(2), pp. 291–97. Churchill College, Cambridge.

**Ofer, Aharon R. and Thakor, Anjan V.**—A Theory of Stock Price Responses to Alternative Corporate Cash Disbursement Methods: Stock Repurchases and Dividends

This paper develops a model in which managers can signal their firms' true values by using either a dividend or a stock repurchase or both. The authors explain a number of stylized facts about these cash disbursement mechanisms, particularly those concerning the relative magnitudes of stock price responses to dividends and repurchases. Most importantly, they explain why a stock repurchase elicits a significantly higher price response, on average, than a dividend announcement. *J. Finance*, June 1987, 42(2), pp. 365–94. Tel-Aviv University; Indiana University.

**Reinganum, Marc R. and Shapiro, Alan C.**—Taxes and Stock Return Seasonality: Evidence from the London Stock Exchange

Prior to the introduction of capital-gains taxes, seasonality is not detected in the returns of firms that traded on the London Stock Exchange. However, after the imposition of a capital-gains tax, the British stock return data exhibit apparent monthly effects in both January and April. Additional analysis reveals that, while the April effect is consistent with the tax-loss-selling hypothesis, the January effect cannot be attributed solely to the introduction of capital-gains taxation. Furthermore, the authors efforts indicate that much caution should be exercised when interpreting studies that compare results from non-U.S. data sources with those from U.S. data. *J. Bus.*, Apr. 1987, 60(2), pp. 281–95. University of Southern California.

**Shanken, Jay**—Multivariate Proxies and Asset Pricing Relations: Living with the Roll Critique

A framework is developed in which inferences can be made about the validity of an equilibrium asset pricing relation, even though the central aggregate in this relation is unobservable. A multivariate proxy for the true market portfolio, consisting of an equal-weighted stock index and a long-term government bond index, is employed in an investigation of the Sharpe-Lintner CAPM. The hypothesis that (1) CAPM

is valid; and (2) multiple correlation between the true market portfolio and proxy assets exceeds 0.7. Connections to the equilibrium factor pricing literature are also explored. *J. Finan. Econ.*, Mar. 1987, 18(1), pp. 91-110. University of Rochester.

**Wilson, Jack W. and Jones, Charles P.**—A Comparison of Annual Common Stock Returns, 1871-1925 with 1926-1985

Lawrence Fisher and James H. Lorie, and Roger G. Ibbotson and Rex A. Sinquefeld have documented annual returns on common stocks since 1926. Prior to 1926, due to the work of the Cowles Commission, annual returns can be extended back to January 1871. This study utilizes Alfred Cowles's reconstruction of common stock returns to provide a comparison between the periods 1871-1925 and 1926-85. A comparable series of annual returns over the complete 115-year period is developed in both nominal and inflation-adjusted terms. The comparison of the two periods suggests that the inflation-adjusted return averages 6.6 percent with similar variability between the two periods. *J. Bus.*, Apr. 1987, 60(2), pp. 239-58. North Carolina State University.

### 314 Financial Intermediaries

**Masulis, Ronald W.**—Changes in Ownership Structure: Conversions of Mutual Savings and Loans to Stock Charter

This study analyzes both the causes and effects of mutual S&L conversions to corporate charter. Changes in technology and government policies have substantially increased S&L competition, riskbearing, and potential scale and scope economies. Evidence indicates that these changes have decreased the relative operating advantages of mutual S&Ls, encouraging conversions to stock charter. The S&L's financial and operating characteristics, which affect the success of the conversion effort, are also explored. *J. Finan. Econ.*, Mar. 1987, 18(1), pp. 29-59. Southern Methodist University.

**Meester, Loretta J.**—A Multiproduct Cost Study of Savings and Loans

This paper investigates the cost structure of savings and loans. Most studies of financial institutions failed to take into account their

multiproduct nature. Using the multiproduct approach, the existence of subadditivity, multiproduct global and product-specific economies of scale and scope, and substitutability between inputs is investigated. A translogarithmic cost function is estimated using 1982 data on California savings and loans. Restrictive functional forms also estimated are rejected. Standard errors for the statistics calculated are estimated and various statistical tests are conducted. Previous authors have not calculated standard errors for these statistics. No evidence of subadditivity in the industry is found. *J. Finance*, June 1987, 42(2), pp. 423-45. Federal Reserve Bank of Philadelphia.

### 320 FISCAL THEORY AND POLICY; PUBLIC FINANCE

#### 321 Fiscal Theory and Policy

**Artus, Patrick**—Les dépenses publiques et leur mode de financement en économie ouverte avec changes flexibles: efficacité et stabilité de l'économie (Public Expenditures and Deficit Financing in an Open Economy with Flexible Exchange Rates: Efficiency and Stability of the Economy)

In this article, a dynamic model for an open economy with flexible exchange rates is developed and used to study the efficiency of an increase in public expenditures in the long run, according to the way it is financed, and its long term effect on prices. The stability of the economy in the different cases is also analyzed in relation to the sensitivity of investment with respect to interest rates and to the degree of price rigidity. *Ann. Econ. Statist.*, July/Sept. 1986, (3), pp. 119-40 (French). Bank of France.

**Aumann, Robert J.; Kurz, Mordecai and Neyman, Abraham**—Power and Public Goods

A game-theoretic analysis using the Harsanyi-Shapley nontransferable utility value indicates that the choice of public goods in a democracy is not affected by who has voting rights. This is corroborated by an independent economic argument based on the implicit price of a vote. *J. Econ. Theory*, June 1987, 42(1), pp. 106-27. Hebrew University, Israel; Stanford University; Hebrew University, Israel.

**Croemer, Helmut; Kessler, Denis and Peltier, Pierre**—Fertility Differentials and the Regressive Effect of Public Debt

This paper shows that public debt issue may be regressive given the following three conditions: that the number of children varies among families; that a bequest motive implies operative intergenerational transfers; and that debt finance of government expenditure postpones its actual payment to the next generation. Though perhaps minor, this effect of fertility differentials ought to be considered when assessing the overall distributive incidence of debt finance as compared to tax finance. *Economica*, Feb. 1987, 54(213), pp. 79-87. University of Liege, Belgium; University of Paris-X, Nanterre, France; University of Liege & CORE, Belgium.

**Dalamagas, Basil A.**—A Flow of Funds Analysis of Crowding Out: Some International Evidence

The combination of large budget deficits among industrial countries and high real interest rates has rekindled interest in crowding out. Most empirical work to date, in testing the implications of expansionary fiscal policy measures, finds that bond-financed increases in government expenditure displace equal amounts of real private activity in the long run. This paper brings a different perspective to empirical investigations of government fiscal policies by expanding the analysis to a sample containing the most industrialized OECD countries. The results are inconsistent with the idea of crowding out and lend support to the neo-Keynesian position of crowding in effects. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 997-1010. University of Athens, Greece.

**Darrat, Ali F.**—Fiscal Impulse and the Real Economy

This paper examines whether the German authorities can use fiscal (and monetary) policy to raise real output above the trend level. In specifying the anticipated policy and real output equations, Akaike's FPE criterion and Granger's causality tests are employed. These equations, moreover, stress the open-economy nature of Germany and avoid possible endogeneity problems. The results, generated using Zellner's system-estimation method, indicate that only the anticipated component of fiscal policy can cause significant changes in real

output, casting doubt on the usefulness of fiscal policy as a real stabilization tool. *Public Finance*, Dec. 1986, 41(3), pp. 316-30. University of New Orleans.

**Eichberger, Jürgen**—On the Efficacy of Fiscal Policy

This paper shows in a model of an economy with goods, labor, bond, and money market where prices and wages are fixed but the interest rate is flexible, that even in a Keynesian unemployment state an increase in government expenditure will not necessarily increase employment, if production takes time. The robustness of this proposition in regard to expectational assumptions is also studied. *Ann. Econ. Statist.*, July/Sept. 1986, (3), pp. 151-68. Australian National University.

**Hamilton, Jonathan H.**—Optimal Wage and Income Taxation with Wage Uncertainty

Optimal taxation in a two-period model with human-capital investment and second-period wage uncertainty is analyzed. A proportional tax on wages dominates lump-sum taxation and the socially-optimal level of human capital exceeds that which individuals choose. A tax on interest income may raise welfare by encouraging investment in human capital. The interest-income tax reduces the difference between returns to physical and human capital from individuals' inability to reduce human-capital risk through diversification. A positive interest-income tax rate may therefore be optimal, even with an optimal wage tax, by encouraging more investment in human capital. *Int. Econ. Rev.*, June 1987, 28(2), pp. 373-88. University of Florida.

**Kessler, Denis; Perelman, Sergio and Pestieau, Pierre**—L'hypothèse d'équivalence entre impôt et emprunt: un test sur les pays de l'OCDE

This paper provides a short survey of the theoretical discussion on the equivalence between taxation and debt financing of public expenditures. It stresses that the key assumption in this debate concerns the behavior of individuals toward their economic environment and public policy. Then, it turns to an empirical test of

equivalence based on a new sample of 19 OECD countries for the period 1961–83. The conclusion is consistent with previous studies: the case of equivalence between tax and debt financing is not established. *Ann. Econ. Statist.*, July/Sept. 1986, (3), pp. 141–49 (French). University of Paris-X; University of Liege; CORE and University of Liege.

**Kingston, Geoffrey H. and Layton, Allan P.**—The Tax Smoothing Hypothesis: Some Australian Empirical Results

The central proposition of tax-smoothing theory is that intertemporally efficient marginal-tax rates will be *ex ante* uniform over time. Australian postwar tax rates, comprising annual data spanning the period 1949/50 to 1984/85, are found to be random walks. These findings lend some (*prima facie*) empirical support to the "uniformity" proposition. *Australian Econ. Pap.*, Dec. 1986, 25(47), pp. 247–51. University of Queensland, Australia; Macquarie University, Australia.

**Phelps, Edmund S.**—Profits Theory and Profits Taxation

This paper considers welfare effects of a tax on profits in a small, open economy in which firms operate in world "customer markets" so that their profits are not entirely competed away. The conclusion is that, up to a point, a tax on corporate profits increases welfare. Siphoning off some of firms' pure profit allows: a net addition to total tax revenue; a lightening of marginal tax rates on work; a narrowing of the wedge between the after-tax real wage and the marginal productivity of labor; and an increase in productivity and output. The principal cost is that the consequent capital outflow reduces the before-tax wedge, limiting the optimal profits tax rate to less than 100 percent. *Int. Monet. Fund Staff Pap.*, Dec. 1986, 33(4), pp. 674–96. Columbia University.

**Phelps, Edmund S.**—The Significance of Customer Markets for the Effects of Budgetary Policy in Open Economies

A new model of the small, open economy is constructed in which home producers operate in an international "customer market." Increased public expenditure on home output

causes the home real interest rate to rise, boosting the velocity of money. It may also cause home firms to shave their markups, thus boosting the real supply of money. Hence employment is up, at first. But the boom is followed by a slump. *Ann. Econ. Statist.*, July/Sept. 1987, (3), pp. 101–17. Columbia University.

**Quintieri, Beniamino and Rosati, Furio Camillo**—Changes in Tax Structure and Individual Behaviour

In this paper the effects of different tax structures on individual incentives to work and to save are considered. Three different manoeuvres of fiscal policy, characterized by the substitution among progressive income taxation, indirect taxation, and capital taxation, are examined. The result obtained shows that a change in the tax structure modifies individual incentives to work, while it has smaller effects on saving decisions. In particular it is shown that a reduction in progressive income tax, coupled with an increase in indirect tax rate or with an increase in capital taxation, gives rise to an increase in the individual labor supply. *Econ. Notes*, 1986, (3), pp. 30–46. L.U.I.S.S., Rome; University of Teramo, Italy.

**Rogers, Carol Ann**—Expenditure Taxes, Income Taxes, and Time-Inconsistency

Traditional welfare-based comparisons of different tax structures implicitly assume that the government can precommit to its future optimal policy. When optimal tax rates are time inconsistent, however, such comparisons may be misleading. This paper uses a two-period, representative-consumer, optimal-taxation model to study the implications of time consistency for the welfare rankings of expenditure and income taxation. The author shows that the welfare rankings of optimal policies may not be preserved by time-consistent ones. *J. Public Econ.*, Mar. 1987, 32(2), pp. 215–30. Georgetown University.

**Sandmo, Agnar**—A Reinterpretation of Elasticity Formulae in Optimum Tax Theory

This paper presents a unified interpretation of three special cases which have been widely discussed in the theory of optimum taxation.

These are the Corlett-Hague case and two versions of the inverse elasticity rule, derived on the assumption that either the compensated or the uncompensated cross elasticities of demand are zero. It is demonstrated that all three cases imply that it is the compensated elasticities which determine efficient tax differentiation, and that complementarity with the untaxed numéraire, emphasized by W. J. Corlett and D. C. Hague (1953-54), plays a role in the interpretation of all three cases. *Economica*, Feb. 1987, 54(213), pp. 89-96. Norwegian School of Economics and Business Administration, Bergen.

**Shoen, Jeffrey**—Inflation Debt and Fiscal Policy Attitudes

Using a model of intertemporally optimizing households, this paper establishes that fiscal policy needs to be endogenous to preempt instability if one wishes to permit any combination of money and debt finance. Conservative governments enforce a greater margin of preemption than liberal governments. This distinction can generate very different short- and long-run effects on inflation when exogenous financial and fiscal policy variables are altered. *Oxford Econ. Pap.*, Mar. 1987, 39(1), pp. 90-110. University of Essex.

**Soofi, Abdollah S. and Parvin, Kumars**—The Import Leakage Effect and the Effectiveness of Fiscal Policy: An Input-Output Analysis

A suggested methodology to measure import leakage magnitude from an economy within the framework of an input-output transactions table, which does not distinguish between domestic and imported inputs, is the paper's objective. The model estimated import leakages due to increased government spending using an Iranian input-output table for 1973-74. Due to the 1974 import structure of the Iranian economy, government fiscal policy (mainly government spending) had a substantially limited effect controlling aggregate demand. The model simulation indicates magnitude of total import leakage for all industries was 20 percent of the estimated increase in 1977 government spending. *Public Finance*, Dec. 1986, 41(3), pp. 430-39. University of Wisconsin-Platteville; San Jose State University.

**Steedman, Ian**—Produced Inputs and Tax Incidence Theory

In the widely used  $2 \times 2$  general-equilibrium analysis of tax incidence the treatment of "capital" is often obscure: when it is clarified, many familiar results from that analysis are found to be invalid. With land, labor, produced inputs, and a zero rate of interest, factor-tax results hold good but excise-tax results do not; with a positive rate of interest, no useful incidence results are available. In a model with a given labor supply and a given total value of capital, the standard incidence theorems are again invalid. *Public Finance*, Dec. 1986, 41(3), pp. 331-49. University of Manchester.

**Stern, Nicholas H.**—The Effects of Taxation, Price Control and Government Contracts in Oligopoly and Monopolistic Competition

Many government contracts with, or policies toward, oligopolistic sectors essentially involve private firms selling a given proportion or quantity of output to the government at a fixed price with the remainder being sold on the open market. Often this is combined with consumer rationing. Examples include cement and sugar in India and health, housing, and defence in many countries. The paper investigates the effects of these schemes (including sales and excise taxation) on prices, output, and household welfare under oligopoly and monopolistic competition. Less government control may raise prices and tax shifting can be above or below 100 percent. *J. Public Econ.*, Mar. 1987, 32(2), pp. 133-58. London School of Economics.

**Yunker, James A.**—A Supply Side Analysis of the Laffer Hypothesis

The "strong Laffer hypothesis" holds that current tax rates are so high that reducing them will increase tax revenue; the "generalized Laffer hypothesis" holds that current tax rates are so high that reducing them will increase social welfare. These hypotheses are investigated using an explicit-function model incorporating a Cobb-Douglas production function, constant elasticity factor-supply functions, and a single "aggregate average tax rate." Innovations in the analysis include adding the capital-supply consideration, allowing for the possibility of negative factor-supply elasticities, and including a

parameter representing the current social-welfare value of public versus private spending. *Public Finance*, Dec. 1986, 41(3), pp. 372-92. Western Illinois University.

### 322 National Government Expenditures and Budgeting

**Bernholz, Peter**—Growth of Government, Economic Growth and Individual Freedom

After presenting some facts about the growth of government in Western industrialized countries, possible causes of this development are analyzed from a public-choice perspective. Next, some empirically tested theories which seek to explain this growth are discussed. Finally, possible consequences for efficiency and individual liberty are examined. It is shown that both the number and size of interest groups (age of democracy) as stated by Mancur Olson (1982) and the increasing share of government expenditure in GDP seem to exert a negative influence on the growth rate of GDP. *J. Inst. Theoretical Econ.*, Dec. 1986, 142(4), pp. 661-83. University of Basel, Switzerland.

**Eisner, Robert and Pieper, Paul J.**—Dette et déficit gouvernementaux: mesures et effets (Measurement and Effects of Government Debt and Deficits)

Budget deficits in the United States and six OECD nations are adjusted for inflation so as to correspond to changes in real net debt. Adjusted high-employment or cyclically-corrected deficits are then found to be positively related, and more clearly and sharply than unadjusted deficits, to subsequent increases in real output and, in the United States, to decreases in unemployment. The adjusted U.S. deficit contributes significantly to OECD growth in GDP. *Ann. Econ. Statist.*, July/Sept. 1986, (3), pp. 27-52 (French). Northwestern University; University of Illinois, Chicago.

**Ram, Rati**—Causality between Income and Government Expenditure: A Broad International Perspective

Using a good procedure and internationally comparable data for the period 1950-80 in respect of sixty-three countries, an investigation is conducted of Granger causality between (1)

GDP per capita and share of general government in GDP and (2) GDP per capita and government expenditure per capita. Although much variation is observed in the patterns of causality across various countries, a rough generalization would seem to be that very limited support is found for the direction of causality implicit in Adolph Wagner's (1890) hypothesis, and support is also lacking in most cases for the causal order implied by several common macroeconomic models. *Public Finance*, Dec. 1986, 41(3), pp. 393-414. Illinois State University.

**Ram, Rati**—Wagner's Hypothesis in Time-Series and Cross-Section Perspectives: Evidence from "Real" Data for 115 Countries

Internationally comparable data on income and government expenditure for 115 countries, covering the period 1950-80, are used to assess the validity of Wagner's hypothesis. Individual country time-series data and several intercountry cross sections are studied. Besides a tremendous diversity in the position for various countries, the results indicate that while there is support for the hypothesis in some time-series data sets, such support is lacking in most cross-section estimates. Much of the support for the hypothesis reported in many earlier studies, therefore, was probably due to either use of limited samples or inadequate data comparability across the observations studied. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 194-204. Illinois State University.

**Spaventa, Luigi**—The Growth of Public Debt: Sustainability, Fiscal Rules, and Monetary Rules

This paper first addresses the question of the sustainability of debt growth by examining the behavior of taxation implied by fiscal rules that respect a government's intertemporal budget constraint. Sustainable debt growth may require the tax burden to rise above some socially acceptable level. In this case, whereas drastic remedies may prove ineffective, a more relevant choice regards the degree of monetary financing of the deficit (as distinct from monetization of the debt), which affects the dynamics of taxation implied by the constraint. Monetary financing is then introduced into a model by

Olivier J. Blanchard, and the effects of monetary financing on the interest rate and capital intensity are examined. Finally, some policy implications are considered. *Int. Monet. Fund Staff Pap.*, June 1987, 34(2), pp. 374-99. University of Rome, Italy.

**Tullio, Giuseppe**—Long Run Implications of the Increase in Taxation and Public Debt for Employment and Economic Growth in Europe

This paper analyzes the major channels through which the sharp rise in taxation and public debt may have influenced European employment and per capita GNP. Its theme is that, since labor unions possess some degree of monopoly power in Europe, taxes have been shifted forward into higher real labor costs. As the long-run elasticity of the demand for labor with respect to the real product wage is high, employment has fallen. The less workers value higher government expenditure, the more they will resist a decline in after-tax real wage rates when these expenditures rise. The paper also examines how taxation, government expenditure, and public debt affect household savings. *Europ. Econ. Rev.*, Apr. 1987, 31(3), pp. 741-74. Commission of the European Communities, Brussels.

**323 National Taxation, Revenue, and Subsidies**

**Bovenberg, A. Lans**—Indirect Taxation in Developing Countries: A General Equilibrium Approach

Indirect taxes are an important element in stabilization tax packages that aim to raise revenue in the short run. This paper evaluates, by using a general-equilibrium model, alternative instruments of indirect taxation in middle-income developing countries. It uses data for Thailand as an illustration and examines the effects on revenue, efficiency, equity, and international competitiveness. The paper shows that the interaction between taxes and the distortions caused by various policies can be important for revenue and efficiency. It also reveals significant backward shifting and a link between outward-looking, supply-side tax policies and trade policies in industrial countries. *Int. Monet. Fund Staff Pap.*, June 1987, 34(2), pp. 333-73. International Monetary Fund, Washington, D.C.

**Hansmann, Henry**—The Effect of Tax Exemption and Other Factors on the Market Share of Nonprofit versus For-Profit Firms

Most jurisdictions exempt nonprofit firms from property, sales, and corporate income taxes in various industries, such as health care and education, in which both nonprofit and for-profit firms compete. Cross-section estimates using state tax data indicate that these exemptions significantly increase the market share of nonprofit firms vis-à-vis their for-profit counterparts. The relative market shares of nonprofit and for-profit firms is also affected by rapid increases in demand for an industry's services and by the size of the governmental sector. *Nat. Tax J.*, Mar. 1987, 40(1), pp. 71-82. Yale University.

**Long, James E. and Caudill, Steven B.**—The Usage and Benefits of Paid Tax Return Preparation

By analyzing a national sample of federal individual income-tax returns, the authors are able to identify important determinants of whether a taxpayer uses an accountant or other professional tax-return preparer. The results confirm previous findings that upper-income taxpayers, the elderly, and self-employed workers are more likely to use a paid preparer than other taxpayers. They also find that professional tax assistance is directly related to the complexity of the tax return and the marginal tax rate on income. Income-tax liability is relatively lower on paid-preparer than self-prepared returns with the same income, filing status, and other characteristics, suggesting that professional tax assistance saves taxpayers money as well as time. *Nat. Tax J.*, Mar. 1987, 40(1), pp. 35-46. Auburn University.

**Stewart, Marion B.**—U.S. Tax Policy, Intra-firm Transfers, and the Allocative Efficiency of Transnational Corporations

A dynamic-programming model of a transnational corporation is constructed under the assumption that the firm's objective is to maximize the after-tax present worth of the parent company's shareholders. It is found that current U.S. tax policy leads to an allocatively inefficient investment schedule and may cause firms to choose factor proportions that deviate from

the cost-minimizing ratio. Repeal of the current tax-deferral provision will lead to a more efficient investment strategy, but complete repeal of the foreign tax credit does not appear desirable unless maximization of U.S. tax receipts is deemed to be of overriding importance. *Public Finance*, Dec. 1986, 41(3), pp. 350-71. Rutgers University.

**Strauss, Robert P. and Wittenberg, Uriel—**Price and Quantity Effects of Tax Reform: An Application to West Virginia

This paper extends a methodology for ascertaining the industry-by-industry effects of tax changes on prices suggested originally by Henry Aaron. The extension utilizes assumptions about the nature of final demand and allows one with an input-output table to derive the total effects of such tax changes in terms of quantities of output as well as employment. The new methodology is applied to West Virginia which substantially reformed its system of gross receipts taxation. The resulting analysis predicts a modest increase in output (+0.2 percent), and a modest decline in the price level (from -0.1 to -2.0 percent) as a result of the reforms enacted in 1985, and scheduled to take effect in mid-1987. *Nat. Tax J.*, Mar. 1987, 40(1), pp. 83-94. Carnegie-Mellon University.

**Wakefield, Joseph C.—**The Tax Reform Act of 1986

The Tax Reform Act of 1986 put in place the most sweeping revision in the history of tax law. This article discusses the major provisions of this act, and presents estimates of the impact of those provisions on personal tax and nontax receipts, corporate profits tax accruals, and other categories of Federal receipts and expenditures on the national income and product accounts basis. *Surv. Curr. Bus.*, Mar. 1987, 67(3), pp. 18-25. U.S. Department of Commerce, Washington, D.C.

### 324 State and Local Government Finance

**Blay, Andrew R.; Ciarrantani, Frank and Spiro, Michael H.—**Incidence of the Amusement Tax

A number of U.S. Cities impose an "amusement" tax on the gross receipts of entertainment establishments, in part as a means of taxing

suburbanites for the city services they utilize. This paper analyzes the incidence of this form of taxation within three major sectors of the urban entertainment industry. Given the authors' assumptions, the analysis concludes that taxes of this kind may not be shifted forward at all (sports franchises), or are only partially shifted (not-for-profit concert and theater series), or are only partially shifted in the long run (movie theaters). *Nat. Tax J.*, Mar. 1987, 40(1), pp. 61-69. University of Pittsburgh.

**Feenberg, Daniel R. and Rosen, Harvey S.—**Tax Structure and Public Sector Growth

It has been hypothesized that a jurisdiction's tax structure exerts an independent effect upon the growth of its public sector. The authors test this hypothesis by examining the relationship between the growth of state general expenditure and the elasticity of tax revenues with respect to income. The work takes advantage of a very careful set of income elasticities for the personal income and sales tax systems for each state, for every year from 1978 to 1983. The data do not support the notion that the form of the tax structure exerts an independent effect on public sector growth. *J. Public Econ.*, Mar. 1987, 32(2), pp. 185-201. National Bureau of Economic Research; Princeton University and National Bureau of Economic Research.

**Sexton, Terri A.—**Forecasting Property Taxes: A Comparison and Evaluation of Methods

Local governments usually face strict budget-balancing requirements wherein access to accurate revenue forecasts is an evident asset to the budgetary process. However, present local-government forecasting practice consists mainly of judgmental methods or simple trend projections. This paper focuses on property taxes, the dominant local government revenue source and identifies, critiques, and evaluates three econometric and statistical alternatives to the present forecasting practice: (1) traditional income elasticity methods; (2) a structural econometric model; and (3) time series or ARIMA methods. Forecast evaluation results for 1981-83 for Minnesota counties affirm the structural model's superiority for single- and multiple-year forecasts, but all of the statistical and econometric methods outperformed the trend

model. *Nat. Tax J.*, Mar. 1987, 40(1), pp. 47-59. University of California, Davis.

#### 400 International Economics

##### 410 INTERNATIONAL TRADE THEORY

##### 411 International Trade Theory

**Barry, Frank G.**—Fiscal Policy in a Small Open Economy: An Integration of the Short-run, Heckscher-Ohlin and Capital Accumulation Models

This paper presents a two-sector model of a small open economy with persistent classical unemployment, and studies its response to government expenditure policies which may be either temporary or permanent, and anticipated or unforeseen. The analysis serves to clarify the relationship between the effects described by the Heckscher-Ohlin and short-run, sector-specific, capital models by embedding both within a more general model of two-sector growth. The perspective developed here stands in sharp contrast to the conventional interpretation of these models as describing consecutive rather than alternative transition stages of the economy. *J. Int. Econ.*, Feb. 1987, 22(1/2), pp. 103-21. University of California, Irvine.

**Beladi, Hamid and Naqvi, Nadeem**—The Theory of Interindustry Wage Differentials: An Intertemporal Analysis

The authors develop an "intertemporal," two-period, two-sector, specific factor model, characterized by generalized wage differentials, and show that a number of pathological results in the domestic distortions literature are all but eliminated. In this model, in contrast to the standard two-sector model, savings and investment are endogenously determined, and trade is not always balanced. They also obtain results pertaining to the implications of wage differentials for the pattern and volume of investment, and the balance-of-trade in the current account. *Can. J. Econ.*, May 1987, 20(2), pp. 245-56. Central Michigan University.

**Burgstaller, André**—Europe's Industrialization and Colonial Underdevelopment in the Light of Ricardo's Corn Model

The paper discusses the dynamics of sectoral resource allocation in an extension of Ricardo's

corn model to a North-South world system. It is shown that free trade and capital mobility in the presence of capital accumulation must entail, in the flexible-wage metropolis, a secular shift of resources out of agriculture into manufacturing, accompanied by real wage growth; in the labor-surplus colonies, a necessary expansion of commercial agriculture but an ambiguous evolution of manufacturing output and employment, giving rise to the possibility of a secular contraction in overall colonial market employment. *J. Int. Econ.*, Feb. 1987, 22(1/2), pp. 157-69. Barnard College, Columbia University.

**Choi, Jai-Young**—Nontraded Goods, Variable Returns to Scale and Welfare

This paper examines the welfare implications of a change in the terms of trade and the rate of tariff, as well as the optimal trade policy for a small country in a three-commodity (two traded and one nontraded) and two-factor model that integrates variable returns to scale. It is shown that three factors, ranking among industrial elasticities of returns to scale, factor intensities, and price-output response, play a major role in determining the fate of the standard results regarding gains from trade. In addition, the optimum tariff for a small economy is derived. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 874-83. Lamar University.

**Clarete, Ramon L. and Roumasset, James A.**—A Shoven-Whalley Model of a Small Open Economy: An Illustration with Philippine Tariffs

This paper describes an applied general-equilibrium model of a price-taking economy in both imports and exports. Sector-specific factors are incorporated to avoid complete-specialization problems. A Hicksian composite traded good market is used for achieving trade balance in the model. Foreign and domestic goods are assumed perfect substitutes. For illustration, Philippine tariffs and export taxes are analyzed using the model. *J. Public Econ.*, Mar. 1987, 32(2), pp. 247-61. University of Western Ontario; University of Hawaii.

**Eaton, Jonathan**—A Dynamic Specific-Factors Model of International Trade

In a dynamic economy, land and capital serve not only as factors of production but as assets which individuals use to transfer income from working periods to retirement. Changes in the terms of trade and in the endowments of fixed factors do not necessarily have the same effects on factor prices and on the composition of output as they do in a static framework. Results derived from the traditional specific-factors model are more likely to emerge when the sector using land as a factor of production has a higher labor share than the sector using capital. *Rev. Econ. Stud.*, Apr. 1987, 54(2), pp. 325-38. University of Virginia and National Bureau of Economic Research.

**Flam, Harry and Helpman, E.—Industrial Policy under Monopolistic Competition**

The authors study the general equilibrium effects of tariffs, export subsidies, output subsidies, and R & D subsidies in a monopolistically competitive sector that produces differentiated products. Apart from allocative effects, the authors examine the desirability of these policies from a welfare point of view. It is shown that a small tariff is welfare improving, but that the other instruments result in ambiguous welfare changes. The results depend on identifiable details of the production structure, the sectoral interlinkages through factor markets, and preferences. These results are compared to other discussions in the literature. *J. Int. Econ.*, Feb. 1987, 22(1/2), pp. 79-102. Institute for International Economic Studies, University of Stockholm; Tel-Aviv University.

**Gros, Daniel—Protectionism in a Framework with Intra-industry Trade: Tariffs, Quotas, Retaliation, and Welfare Losses**

This paper uses Krugman's (1980) model of trade with product differentiation and monopolistic competition to determine the effects of various protectionist measures and concludes that: export and import tariffs are equivalent; quotas are equivalent to tariffs if firms cannot price discriminate between markets (a quota that reduces the market share of imports by 50 percent is equivalent to a tariff of 47 percent); and welfare losses from protectionism are substantial (a "voluntary" export restraint agreement limiting imports by 10 percent causes a

consumer welfare loss in the home country equivalent to a drop in national income of 2 percent). *Int. Monet. Fund Staff Pap.*, Mar. 1987, 34(1), pp. 86-114. Centre for European Policy Studies, Brussels, Belgium.

**Kuhn, Peter and Wooton, Ian—International Factor Movements in the Presence of a Fixed Factor**

To the basic model of international factor mobility is added a third immobile factor. Unlike the basic model, the factor flows that result from a policy of free mobility are now uniquely determined. Additionally, a large variety of privately optimal national policies is predicted, each dependent upon the country's endowment pattern and the fiscal instruments available to it. Several of the predicted policies, e.g. subsidies paid to migrant factors and simultaneous restrictions on the export of both factors, are incompatible with the basic model. *J. Int. Econ.*, Feb. 1987, 22(1/2), pp. 123-40. University of Western Ontario.

**Naqvi, Nadeem—Endogeneous Investment, Current Account and the Rybczynski Theorem**

The author extends the standard single-period, two-sector, two-factor model of production and factor allocation to a two-period setting and, in the process, introduces endogenous savings and endogenous investment into the two-sector model. This is done in such a way that the model can be readily compared with the two-sector model used in trade theory. In addition, the intertemporal formulation of the model enables the analysis of domestic investment and the current account imbalance in the context of the pure theory of international trade. Using this model, some Rybczynski-type propositions are derived. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 925-33. Central Michigan University.

**Tamor, Kenneth L.—An Empirical Examination of the Factor Endowments Hypothesis**

Cross-country regression of net exports on factor endowments has suggested that endowments provide a good explanation of international trade patterns in manufactures. This paper examines whether endowments explain the

composition of manufacturing activity, as is proposed for the most policy-relevant versions of the Heckscher-Ohlin-Samuelson model, or merely the level of manufacturing activity. Application of the cross-country method to output data suggests that endowments do not provide a good explanation of composition. *Can. J. Econ.*, May 1987, 20(2), pp. 387-98. Southern Illinois University.

**Trannoy, Alain**—Paradoxe global des transferts et multiplicité des équilibres: deux résultats (Global Transfer Paradox and Multiplicity of Equilibria: Two Results)

The author proves two results for exchange economies with  $l$  goods,  $n$  individuals without any differentiability assumption: (1) the multiplicity of equilibria for at least one initial allocation is a necessary condition for the existence of the global transfer paradox; and (2) the multiplicity of equilibria for at least one initial allocation is a sufficient condition for the existence of the global transfer paradox. *Ann. Econ. Statist.*, Oct./Dec. 1986, (4), pp. 53-61 (French). University of Rennes-I and GREQE, UER de Sciences Économiques, Rennes.

#### 420 TRADE RELATIONS; COMMERCIAL POLICY; INTERNATIONAL ECONOMIC INTEGRATION

##### 421 Trade Relations

**Antonelli, Cristiano**—The International Diffusion of Process Innovations and the Neotechnology Theory of International Trade

Econometric results confirmed that the capacity of a country to adopt new capital equipment in a timely manner is a major determinant of its performances on international markets together with traditional country and industry specific variables. This result stresses the role of technological change in assessing international competitiveness in a commodity wrongly defined as a "Heckscher-Ohlin good." *Econ. Notes*, Apr. 1986, (1), pp. 60-83. Politecnico of Milan, Italy.

**Bond, Marian E.**—An Econometric Study of Primary Commodity Exports from Developing Country Regions to the World

This paper studies the flow of primary-commodity exports from non-oil exporting developing countries grouped by geographical region.

The first part analyzes the changes in the structure of developing-country commodity exports that have taken place over the past two decades. The second part presents empirical evidence on the response of commodity exports to demand and supply. These empirical results point to the low price and income elasticities of demand for certain primary-commodity exports and to price elasticities of supply that are in general lower than the corresponding price elasticities of demand in the short run, but that are more sensitive to price in the longer run. *Int. Monet. Fund Staff Pap.*, June 1987, 34(2), pp. 191-227. International Monetary Fund, Washington, D.C.

**Dauderstädt, Michael**—Internationale Konkurrenz und Wohlfahrtsstaat. Überlegungen am Beispiel Portugal (International Competition and the Welfare State—The Case of Portugal)

Since the mid-1970s, conservative economists and politicians have increasingly considered the welfare state responsible for the international crisis and the economic decline of nations. Empirical evidence covering the 1950s and 1960s does not corroborate this view. For the more competitive international environment since 1973, the above assumption is tested by a case study of Portugal. The results show that balance-of-payments problems and a loss of competitiveness can be explained by international growth and inflation differentials, overvaluation of the Escudo, and ill-timed expansionary fiscal policies rather than by the redistributive effects of social reform. *Konjunkturpolitik*, 1986, 32(6), pp. 349-80 (German). Instituto de Estudos para o Desenvolvimento, Portugal.

**Greenaway, David and Milner, Chris**—Intra-industry Trade: Current Perspectives and Unresolved Issues

Intraindustry trade has been a frontier area for researchers in international economics over the last twenty-five years. This paper attempts to take stock of what is now a voluminous literature and to identify areas where researchers might fruitfully direct their attention in the near future. The paper focuses on work on theory, measurement, empirical analysis, and policy as-

pects. For each of these areas current perspectives are identified and unresolved issues discussed. The paper concludes that intraindustry trade has been a progressive research program, and that an extensive range of issues remain to be explored. *Weltwirtsch. Arch.*, 1987, 123(1), pp. 39–57. University College at Buckingham; University of Loughborough.

**Lebkowski, Maciej and Monkiewicz, Jan**—Information Industries in the CMEA Countries: A Foreign Trade Dimension

CMEA countries constitute so far a periphery of the world information goods market. This results both from the low degree of their production internationalization as well as the overwhelmingly regional orientation of their trade flows. This regionalization of the trade flows in data goods exceeds significantly the level recorded in their overall trade relations. Such a situation is a reflection of a policy orientation of the CMEA countries justified by the strategic importance of the industries in question. A peculiar feature of the CMEA data goods market is the decisive role of the Soviet import demand for trends and patterns in regional manufacturing and trade. *Konjunkturpolitik*, 1986, 32(5), pp. 308–24. University of Hamburg; Polytechnics Warsaw.

**Nagy, András**—Changes in the Structure and Intensity of East–West Trade

The first part of the article summarizes the changes in the European socialist countries' strongly aggregated import and export trade patterns between 1960 and 1980, with special regard to the trade with the advanced industrial countries. The second part quantifies the effects of trade policy on East–West trade relations during the same period. The effect of political factors hindering East–West trade has been found to be very strong, the political estrangement of the 1980s and the strengthening of protectionist tendencies may stop or set back earlier improvements. *Acta Oecon.*, 1985, 35(3–4), pp. 359–75. Institute of Economics, Hungarian Academy of Sciences, Budapest.

**Oblath, Gábor and Pete, Péter**—Trade with the Soviet Union: The Finnish Case

Finno–Soviet trade is a special part of East–West economic relations. The volume of trade between the two countries is exceptionally large and its institutional system is similar to that of trade among socialist countries. The volume and pattern of Finno–Soviet trade is based on intergovernmental agreements containing quotas for exports and imports, and payments between the two countries are settled through a bilateral clearing system. However, the advantages of the Finno–Soviet trade for Finland is not attributable to the special domestic regulation of bilateral trade, but to the vitality and the ability of the Finnish economy to adjust to different needs and institutional frameworks. *Acta Oecon.*, 1985, 35(1–2), pp. 165–94. Institute for Economic and Market Research, Budapest; Institute of Economics, Hungarian Academy of Sciences, Budapest.

**Sarkar, Prabirjit**—The Singer–Prebisch Hypothesis: A Statistical Evaluation

The statistical objections raised against the Singer–Prebisch thesis regarding the secular decline in the terms of trade of primary products in relation to manufactures, do not have as sound a basis as is generally supposed they have on *a priori* grounds. The projection of that historical experience into the post-war years as made by H. W. Singer and R. Prebisch also holds good until the oil crisis years of the 1970s; it would hold true up to 1983 if oil and OPEC are excluded as a special case. With the decline in the terms of trade of primary products, the trading terms of the developing region vis-à-vis the developed one also deteriorated. In view of increasing manufacture exports by the developing region, it is doubtful how far the two terms-of-trade indexes will move in the same direction. *Cambridge J. Econ.*, Dec. 1986, 10(4), pp. 355–71. Calcutta University.

**Whichard, Obie G.**—U.S. Sales of Services to Foreigners

The Bureau of Economic Analysis has recently undertaken to improve and expand its statistical information on U.S. international trade and investment in services. This effort, in support of the increased emphasis on services in U.S. trade policy, is designed to improve the information on services included in the U.S.

international transactions accounts. This article outlines the Bureau's data improvement program and presents new data on sales of services by U.S. multinational companies. These new data indicate that most services sold by U.S. multinational companies to foreigners during 1982-84 were from foreign affiliates rather than the U.S. parent. *Surv. Curr. Bus.*, Jan. 1987, 67(1), pp. 22-41. U.S. Department of Commerce, Washington, D.C.

**Winters, L. Alan—An Empirical Intertemporal Model of Developing Countries' Imports**

This paper specifies and estimates an intertemporal model of total imports for three developing countries. Imports are related to current and expected values of foreign-exchange receipts, import prices, and interest rates. For two out of the three countries the intertemporal model appears best, while for the third it is (just) dominated by another financial model. The paper shows: that financial variables explain most of the variance in developing countries' imports; that there is a substantial degree of intertemporal substitution; and that poorer countries have higher rates of time discount than richer ones. *Weltwirtsch. Arch.*, 1987, 123(1), pp. 58-80. University of North Wales.

**Zilberfarb, Ben-Zion—The Effect of Relative Exchange and Market Growth Rates on the Geographic Allocation of Exports: More Empirical Evidence**

Based on a pooled cross-section, time-series data set for Israeli industrial exports in 1982 and 1983, this study provides empirical support for the hypothesis that exporters respond to changes in relative exchange rates and market conditions in export markets when deciding on the geographical allocation of their exports. These factors explain over 88 percent of the variance in the U.S. share in Israel's industrial exports in the 1982 to 1983 period. *Quart. J. Bus. Econ.*, Summer 1987, 26(3), pp. 96-101. Vanderbilt University.

**422 Commercial Policy**

**Boyd, Roy and Krutilla, Kerry—The Welfare Impacts of U.S. Trade Restrictions against the Canadian Softwood Lumber Industry: A Spatial Equilibrium Analysis**

In this paper the authors estimate the production and welfare impacts of various U.S. trade restrictions on Canadian lumber. After building a model which incorporates the regional character of the North American lumber market, the authors simulate a variety of tariffs and quotas now advocated by a number of U.S. lawmakers. They find that the tariff losses incurred by Canadian producers could be substantial, depending on the elasticity of their export supply. Voluntary restraint agreements, however, might lead to Canadian gains as high as 40 percent of their preexisting profits. *Can. J. Econ.*, Feb. 1987, 20(1), pp. 17-35. United States Department of Agriculture, Washington, D.C.; Duke University.

**Clark, Don P.—Regulation of International Trade in the United States: The Tokyo Round**

A model based on the economic theory of regulation is used to explain the interindustry pattern of tariff protection that emerged from the Tokyo Round. Although tariff reductions were modest and were conducted in large part using a harmonization tariff-cutting formula, evidence reported here suggests that domestic pressure groups were able to exercise influence over post-Tokyo Round tariff levels. Results of this analysis provide support for the Marvel-Ray tariff formation model. *J. Bus.*, Apr. 1987, 60(2), pp. 297-306. University of Tennessee.

**Collins, Charles and Dunaway, Steven—The Cost of Trade Restraints: The Case of Japanese Automobile Exports to the United States**

This paper assesses the extent to which restraints on exports of Japanese automobiles to the United States affected car sales and prices in the period 1981-84. The estimates are based on a model of the U.S. automobile sector that allows for the effects of the quotas on the average quality of cars purchased in order to distinguish between pure price effects and quality effects. The results presented in the paper suggest that the restraints had a substantial impact on automobile prices (adjusted for quality improvements) and thus imposed a heavy welfare cost on the U.S. economy. *Int. Monet. Fund Staff Pap.*, Mar. 1987, 34(1), pp. 150-75. International Monetary Fund, Washington, D.C.

**Giersch, Herbert**—*Weltwirtschaftliches Wachstum durch Liberalisierung* (Global Economic Growth by Liberalization)

The United States and East Asia have extricated themselves more quickly from the relative stagnation of the 70s and early 80s than Europe, which suffers from more rigidities and still lacks sufficient downward flexibility of real wages. To revitalize its economy, Europe has to free its markets from state regulations and make them more accessible to domestic and international competition. With a swift trade liberalization, Europe—and the world—could tap a large source of productivity growth. In order to facilitate the import-induced decline of old industries, free activity zones should be established in the affected regions. *Kyklos*, 1986, 39(4), pp. 518–36 (German). Institut für Weltwirtschaft, Universität Kiel, Germany.

**MacPhee, Craig R.**—The Consistency of Partial Equilibrium Estimates of Trade Creation and Diversion

The author evaluates several empirical studies which have predicted different outcomes for preferential trade arrangements as a result of Tokyo Round tariff cuts. Some of the elasticities used in the empirical models are found to be inconsistent with their underlying assumptions. Consistent values for the elasticities are derived, and these are used to show how some empirical estimates may differ. The importance of the aggregation problem in such studies is also assessed. *Weltwirtsch. Arch.*, 1987, 123(1), pp. 81–92. University of Nebraska, Lincoln.

**Ray, Edward John**—The Impact of Special Interests on Preferential Tariff Concessions by the United States

This paper provides empirical evidence on the relative impact of the generalized system of preferences, adopted in 1975, and the Caribbean Basin Initiative, adopted in 1983, on the pattern of U.S. imports of manufactured goods from the target areas at the four-digit level in 1984. Imports from Brazil, Mexico, South America, the Caribbean Basin, and all eligible countries are each analyzed. The author provides evidence that existing preferential agreements have failed to offset the bias in U.S. protection against competitive exports from

developing countries and explains why one might have predicted such an outcome. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 187–93. Ohio State University.

**Rousslang, Donald J.**—The Opportunity Costs of Import Tariffs

Existing estimates of the welfare cost of import tariffs ignore the social cost of replacing the tariff revenue with another tax. As a practical matter, this is an important omission because the alternative tax might entail a substantial welfare cost. This paper examines the relative efficiency of import tariffs and existing domestic taxes. As a case study, comparisons are made between the welfare cost imposed by replacing the tariff revenue using the alternative domestic taxes in the United States. It is found that the alternative U.S. domestic taxes are probably less efficient than U.S. tariffs. *Kyklos*, 1987, 40(1), pp. 88–102. International Trade Commission, Washington D.C. and George Washington University.

#### 430 INTERNATIONAL FINANCE

**431 Open Economy Macroeconomics; Exchange Rates**

**Adams, Charles and Gros, Daniel**—The Consequences of Real Exchange Rate Rules for Inflation: Some Illustrative Examples

This paper examines consequences of real exchange-rate rules for the control of inflation in the context of several popular macroeconomic models. It argues that the authorities will not be able to achieve any target for inflation if they follow such a rule, depreciating the nominal exchange rate in line with the difference between world and domestic inflation. Following a real exchange-rate rule serves to index both the nominal exchange rate and, through the balance of payments, the money supply to the price level. Thus there is no exogenous nominal anchor to tie prices down. *Int. Monet. Fund Staff Pap.*, Sept. 1986, 33(3), pp. 439–76. International Monetary Fund, Washington, D.C.; Centre for European Policy Studies, Brussels.

**Bhandari, Jagdeep S. and Decaluwe, Bernard**—A Stochastic Model of Incomplete Separation between Commercial and Financial Exchange Markets

This paper constructs a framework that is suitable for the analysis of a dual exchange market regime characterized by intermarket leakage. The model incorporates the fact that in reality certain proportions of both trade-account and service-account items are settled in the financial market on account of both legally-sanctioned leakage and fraudulent transactions. The model is utilized to investigate the dynamic and static proportion of the economy with respect to the degrees of export, import, and service account leakage as well as with respect to other parameters of interest. *J. Int. Econ.*, Feb. 1987, 22(1/2), pp. 25-55. West Virginia University; University of Laval, Quebec.

**Biasco, Salvatore—Currency Cycles and the International Economy**

This article argues that, if all available information is not conveyed through prices, portfolio adjustment is gradual and the currency market does not reflect a continuous stock equilibrium. A sequence is described in which the divergence or convergence of different signals from the real and financial markets guides the financial choices of agents with different time horizons, and produces a cycle of the exchange rate between key currencies. Certain endogenous characteristics of economic policy strengthen the cycle. Currency cycles are not neutral from the sectoral point of view and cannot be analyzed separately from the sectoral dynamics which they produce. *Banca Naz. Lavoro Quart. Rev.*, Mar. 1987, 40(160), pp. 31-60. Università degli Studi di Roma "La Sapienza," Rome.

**Blackburn, Keith—Interest Parity, the Degree of Capital Mobility and the Information Contents of the Exchange Rate and the Interest Rate: Clarifications and Extensions**

This paper explores the role of the exchange rate and the interest rate as information variables in a small macroeconomic model under conditions of perfect and imperfect capital mobility. It is shown that, despite the intimate relationship between these variables via interest parity, the information content of each is generally different, the nature of this information being crucially dependent upon the degree of capital mobility. Implications are drawn for the dynamic behavior of the exchange rate and

prices. An implication of the analysis focuses on the role of policies designed to alter the degree of capital mobility. *Manchester Sch. Econ. Soc. Stud.*, Mar. 1987, 55(1), pp. 60-76. University of Southampton.

**Buiter, Willem H.—Macroeconomic Policy Design in an Interdependent World Economy: An Analysis of Three Contingencies**

This paper uses an analytical two-region (United States and "rest of industrial world") model to analyze three issues in international macroeconomic interdependence and policy coordination: What should be the monetary/fiscal response in other industrial countries to tightening U.S. fiscal policy, and what should be the U.S. monetary response? What should be the U.S. and industrial world's monetary/fiscal responses to a collapse of the dollar? What should be the macroeconomic policy response to disappointing real growth performance? Correct identification of the cause(s) for a "hard landing" of the dollar and for disappointing real growth is crucial to appropriate policy responses. *Int. Monet. Fund Staff Pap.*, Sept. 1986, 33(3), pp. 541-82. Yale University.

**Büttler, Hans-Jürg and Schipf, Bernd—Equilibrium Exchange Rates in a Multi-country Model: An Econometric Study**

In this paper equilibrium exchange rates are computed in a multi-country econometric model for the U.S. dollar, Japanese yen, German mark, Canadian dollar, pound sterling, Swiss franc, and a composite currency for the rest of the world. The simulation of the model, which is fully interdependent with regard to bilateral exchange rates, is not possible for all points of time even though the model is locally stable. It is shown that neither the total current account balance nor the bilateral trade balance is a reliable measure of whether or not the bilateral exchange rates are overvalued. *Welt-wirtschaft. Arch.*, 1987, 128(1), pp. 1-23. Swiss National Bank, Zurich; Forschungsstelle für Empirische Wirtschaftsforschung, St. Gallen.

**Calvo, Guillermo A.—Real Exchange Rate Dynamics with Fixed Nominal Parities: Structural Change and Overshooting**

The relationship between structural changes that require a modification of the steady-state level of the real exchange rate is examined in terms of a model of staggered prices and real-wealth effects. Although wealth effects are necessary for overshooting, it is shown that their actual values are of no particular relevance; in fact, overshooting is shown to be more likely, the smaller is the real-wealth effect in the demand for tradables. A key (and counterintuitive) result is that overshooting is more likely the higher the frequency of price changes. *J. Int. Econ.*, Feb. 1987, 22(1/2), pp. 141-55. Columbia University.

**Frenkel, Jacob A. and Goldstein, Morris—A Guide to Target Zones**

This paper identifies key issues surrounding the advisability and practicality of adopting "target zones" for exchange rates of major currencies. Among the issues discussed are: What is meant by a target zone approach to exchange rate management? What factors motivate the call for target zones? How might target zones remedy the perceived deficiencies of the existing system of managed floating? What factors are behind much of the opposition to target zones? How would the target zones be calculated? What currencies would be included? How wide should the zones be? How would actual exchange rates be kept within the target zones? *Int. Monet. Fund Staff Pap.*, Dec. 1986, 33(4), pp. 633-73. International Monetary Fund, Washington, D.C.

**Greenwood, Jeremy and Kimbrough, Kent P.—An Investigation in the Theory of Foreign Exchange Controls**

A choice-theoretic, cash-in-advance model is constructed to examine foreign-exchange controls. While foreign-exchange controls improve the trade balance and the balance-of-payments (or exchange rate) they reduce welfare for a distortion-free, small, open economy. This is because foreign-exchange controls essentially place a quota on imports. Shocks to the terms-of-trade are shown to be transmitted negatively to the domestic economy when exchange controls are in effect. Devaluations are found not to have real effects. Finally, it is argued that foreign-exchange controls are not the optimal

policy for attaining trade-balance objectives. *Can. J. Econ.*, May 1987, 20(2), pp. 271-88. University of Western Ontario; Duke University.

**Gregory, Allan W.—Testing Interest Rate Parity and Rational Expectations for Canada and the United States**

The purpose of this paper is to examine the joint hypothesis of interest-rate parity and rational expectations for Canada and the United States using monthly data. Two approaches to testing are considered: (1) the substitution method and (2) testing the cross-equation non-linear rational expectations restrictions from solving the interest-rate parity equation. It is demonstrated that standard application of the substitution method requires the assumption that the interest-rate parity equation holds deterministically. Tests for unit roots in the spot exchange-rate and interest-rate differentials are also investigated. *Can. J. Econ.* May 1987, 20(2), pp. 289-305. University of Western Ontario and Queen's University.

**Hodrick, Robert J. and Srivastava, Sanjay—Foreign Currency Futures**

The theoretical nature of risk premiums in foreign currency futures markets is derived and studied empirically. Estimation problems encountered in using futures data are discussed. Since forward rates and futures prices have been found to be approximately equal and because risk premiums in forward markets are highly variable, consistency of the data requires time variation in daily risk premiums in the futures market. Unbiasness of daily futures prices as predictors of the following day's futures price is rejected for all currencies. Reconciliation of daily and monthly data requires positive serial correlation in daily risk premiums. *J. Int. Econ.*, Feb. 1987, 22(1/2), pp. 1-24. Northwestern University; Carnegie-Mellon University.

**Isard, Peter—Lessons from Empirical Models of Exchange Rates**

This paper first discusses the relationships among exchange rates, national price levels, interest-rate differentials, and international bal-

ances of payments. These discussions provide perspectives on elements of truth that are consistent with the empirical failures of existing exchange-rate models. Other lessons discussed include the importance of analyzing exchange rates within complete macroeconomic frameworks and of assuming that expectations are generated through model-consistent processes. The paper raises questions about the validity of the uncovered interest-parity hypothesis and discusses approaches for distinguishing assets and specifying portfolio preferences in ways that have solid microeconomic foundations. *Int. Monet. Fund Staff Pap.*, Mar. 1987, 34(1), pp. 1-28. International Monetary Fund, Washington, D.C.

**Ize, Alain and Ortiz, Guillermo—Fiscal Rigidities, Public Debt, and Capital Flight**

This paper associates exchange-rate crises and capital flight with the possibility of default on public debt, resulting from fiscal rigidities. By including interest-bearing debt, both domestic and external, the model can generate the timing of an attack and can explain why domestic public bonds, even when perfectly indexed, cannot eliminate the possibility of a crisis. This fiscal framework provides explanations for the simultaneity of private capital flight and public foreign borrowing and the wide observed fluctuations in real exchange rates. The recent experience of Mexico is a particularly fitting illustration. *Int. Monet. Fund Staff Pap.*, June 1987, 34(2), pp. 311-32. International Monetary Fund, Washington, D.C.

**Kamas, Linda—The Balance of Payments Offset to Monetary Policy: Monetarist, Portfolio Balance, and Keynesian Estimates for Mexico and Venezuela**

Three balance-of-payments equations are specified and estimated for Mexico and Venezuela. While a large offset is found for Venezuela, there is no evidence of a significant offset for Mexico in the 1970s. However, it is shown that from 1951 to 1970, the offset was close to minus one, suggesting there was structural change in the 1970s. The estimated offset for Venezuela in the Keynesian equation is smaller than that in the monetarist equation, supporting arguments that the latter is biased toward

minus one. However, the long-run offset is minus one in accordance with both approaches. *J. Money, Credit, Banking*, Nov. 1986, 18(4), pp. 467-81. Wellesley College.

**Lizondo, José Saúl—Unification of Dual Exchange Markets**

This paper develops the model of an economy under a dual exchange system, comprising an official market in which the exchange rate is crawling at a constant rate and a free market in which the exchange rate is determined by market forces. After analyzing the behavior of the economy under the dual system, the paper discusses the effects that switching to a unified floating system or a unified crawling peg system has on the exchange rate and on the balance of payments, particularly in the short run. *J. Int. Econ.*, Feb. 1987, 22(1/2), pp. 57-77. Universidad Nacional de Tucumán, Casilla de correo 209, (4000) San Miguel de Tucumán, Argentina.

**Masson, Paul R. and Knight, Malcolm—International Transmission of Fiscal Policies in Major Industrial Countries**

This paper specifies a simple theoretical model of saving and investment behavior and estimates it with data for the United States, West Germany, and Japan over 1961-83. The model is then simulated to examine the effects of shifts in the fiscal deficits of those countries in 1982-85 and of investment incentives in the United States. The simulations indicate that these fiscal changes explain a substantial part of the dollar's appreciation against other major currencies, the high level of world interest rates, and current account developments in the three largest industrial economies over that period. *Int. Monet. Fund Staff Pap.*, Sept. 1986, 33(3), pp. 387-438. International Monetary Fund, Washington, D.C.

**Rübel, Gerhard—Factors Determining External Indebtedness**

The determinants of external indebtedness for a raw-material importing country are examined here using an intertemporal approach. It is shown that a rise in price of the raw-material import always leads to a real-income loss but not necessarily to a worsening of the current

account and therefore to external indebtedness. Rather, what is important is whether the price increase is seen as temporary or permanent or merely expected for the future. Other influences on external indebtedness, such as changes in interest-rate levels or government revenue and expenditure policies are also discussed. *Econ. Notes*, 1986, (3), pp. 101-21. University of Mannheim, West Germany.

**Sarantis, Nicholas—A Dynamic Asset Market Model for the Exchange Rate of the Pound Sterling**

The aim of this paper is to examine the influence of domestic foreign assets held by U.K. residents, as well as of North Sea oil, on the value of the pound sterling. Firstly, a theoretical model based on the portfolio-balance approach is developed. Subsequently, a disequilibrium version of this model is specified and then applied to five bilateral exchange rates vis-à-vis sterling. Several diagnostic statistics are employed for evaluating the regression results, which provide a satisfactory explanation of sterling's behavior and lend support to the approach adopted. *Weltwirtsch. Arch.*, 1987, 123(1), pp. 24-38. Thames Polytechnic School of Social Sciences, London.

**Tarafás, Imre and Szabó, Judit—Hungary's Exchange Rate Policy in the 1980s**

This article analyzes the development of the cost and price competitiveness of Hungarian exports between 1970 and 1984 by means of real effective exchange rate calculations. In the Hungarian economy, changes in exchange rate influence the price level while they only exert moderate effects on relative prices and relative incomes. It was found that there were market fluctuations in the development of real, effective exchange rates, but that these fluctuations do not influence Hungarian exporters' pricing behavior. The latter depends rather on the buoyancy of economic activity in external markets. *Acta Oecon.*, 1985, 35(1-2), pp. 53-79. National Bank of Hungary, Budapest.

**Turnovsky, Stephen J.—Optimal Monetary Policy and Wage Indexation under Alternative Disturbances and Information Structures**

The interdependence between the optimal degree of wage indexation and optimal monetary policy is analyzed for a small open economy under a variety of assumptions regarding: (1) relative information available to private agents and the stabilization authority; and (2) the perceived nature of the disturbances impinging on the economy. The distinctions between: (1) unanticipated and anticipated disturbances, and (2) permanent and transitory disturbances, are emphasized. The extent to which stabilization is achieved is shown to depend upon the nature of the disturbances and the available information. The policy redundancy issue is emphasized, implying that optimal rules can frequently be specified in many equivalent ways. *J. Money, Credit, Banking*, May 1987, 19(2), pp. 157-80. University of Illinois.

**Wolff, Christian C. P.—Forward Foreign Exchange Rates, Expected Spot Rates, and Premia: A Signal-Extraction Approach**

The author implements a methodology to identify and measure premia in the pricing of forward foreign exchange that involves application of signal-extraction techniques from the engineering literature. Diagnostic tests indicate that these methods are successful in capturing the essence of the time-series properties of premia. The estimated premium models indicate that premia show a certain degree of persistence over time and that more than one-half of the variance in the forecast error that results from the use of current forward rates as predictors of future spot rates, is accounted for by variation in premium terms. *J. Finance*, June 1987, 42(2), pp. 395-406. London Business School.

**440 INTERNATIONAL INVESTMENT AND FOREIGN AID**

**441 International Investment and Long-term Capital Movements**

**Hiemenz, Ulrich—Foreign Direct Investment and Industrialization in ASEAN Countries**

This paper provides an evaluation of foreign direct investment in ASEAN's "Other Four" in the 1970s and early 1980s. Sectoral composition of foreign direct investment and marketing strategies applied by transnational corporations from Germany, Japan, and the United States have differed substantially in the region, but

the impact of foreign direct investment on industrialization and export expansion appears to have converged over time. Furthermore, there are indications that the transfer of technology has made a more important contribution to the emergence of internationally competitive industries in ASEAN countries than the direct participation of foreign affiliates in manufactured exports. *Weltwirtschaft. Arch.*, 1987, 123(1), pp. 121-39. Institut für Weltwirtschaft, Kiel.

**Yannopoulos, George N.—European Community Tariff Preferences and Foreign Direct Investment**

This paper explores the links between preferential trading arrangements and foreign direct investment by focusing on the European Community's nonreciprocal preferences to developing countries. The analysis specifies the conditions under which the export opportunities generated by tariff preferences stimulate foreign direct investment and derives certain testable hypotheses regarding the structure and the geographical distribution of this investment directly from the theories of economic integration and the multinational enterprise. The paper also looks at the pattern of foreign direct investment in the countries benefiting from European Community tariff preferences, and examines how far it provides support for the hypotheses advanced. *Banca Naz. Lavoro Quart. Rev.*, Mar. 1987, 40(160), pp. 93-109. University of Reading, United Kingdom.

**442 International Business**

**Chen, Tain-Jy and Tang, De-Piao—Offshore Assembly and Short-run Labor-Labor Substitution**

This paper investigates the short-run production relationship in offshore assembly, using the case of Taiwan's electronics industry. Skilled and unskilled production workers are found to be substitutes for one another and both are complementary to white-collar workers. Material is a substitute for all types of labor. The implications of the wage policies of less-developed countries and the tariff provision for offshore assembly utilized by industrial countries are discussed. The important role and indispensability of white-collar workers to develop-

ment are considered. *Weltwirtschaft. Arch.*, 1987, 123(1), pp. 140-48. Drexel University; University of Missouri at Columbia.

**Das, Sanghamitra—Externalities, and Technology Transfer through Multinational Corporations: A Theoretical Analysis**

This paper examines the optimal behavior of a multinational firm's subsidiary in a host country when learning of its production techniques by its native rivals occurs. In a dynamic framework, it is shown, among other things, that (1) it is worthwhile for the subsidiary to import better technology from its parent firm and that (2) such technology transfer may not benefit the firms of the host country despite their learning, while the host country as a whole does benefit. *J. Int. Econ.*, Feb. 1987, 22(1/2), pp. 171-82. University of Wisconsin.

**Hill, H. and Lindsey, C. W.—Multinationals from Large and Small Countries: A Philippine Case Study**

This paper examines differences between foreign investors from "large" and "small" countries, on the basis of two separate but related surveys of firms in Philippine manufacturing. In many areas the behavior of the two groups did not differ greatly. But there is some evidence to suggest that the small country investors: relied less on proprietary technology and brand names; were more export oriented; had a preference for joint ventures; and conferred greater autonomy on local subsidiaries. *Banca Naz. Lavoro Quart. Rev.*, Mar. 1987, 40(160), pp. 77-92. Australian National University; Trinity College.

**Streeten, Paul—"New" Directions for Private Resource Transfers**

This article explores forms of international resource transfers that lie between 100 percent foreign-owned, direct-equity investment and arm's length transactions between independent agents. The essence of these arrangements is that components of the direct-investment package are unbundled and sold separately, but the multinational firm continues to maintain an interest and a degree of control. The best way of transferring some aspects of technology is

examined. An analytical framework is put forward for analyzing various forms of unbundling. On some conditions, both host country and multinational firm benefit; on others, both lose; on a third set of conditions the host country benefits at the expense of the firm; and on a fourth vice versa. *Banca Naz. Lavoro Quart. Rev.*, Mar. 1987, 40(160), pp. 61-76. World Development Institute, Boston University.

#### 443 International Lending and Aid (public)

**Amelung, Torsten and Mehlretter, Thorsten**—Early-warning Systems in Light of the International Debt Crisis

An assessment of various types of early-warning systems with respect to their predictive power during the recent debt crisis reveals a rather poor performance of all models tested, irrespective of the degree of statistical sophistication. In addition to reviewing the models to be found in the literature, two systems are applied for the period of 1978 to 1983 based on the data for twelve developing countries. Interestingly, the relatively simple model actually outperforms the statistically more sophisticated one. Early-warning systems should rely more on economic theory than on empirical experience and become more country specific. *Konjunkturpolitik*, 1986, 32(5), pp. 257-81. Kiel Institute of World Economics, Germany; Giesen University.

**Levy, Victor**—Anticipated Development Assistance, Temporary Relief Aid, and Consumption Behaviour of Low-Income Countries

Much debate about the effectiveness of foreign aid to developing countries focuses on the assumption that aid flows mainly enhance current consumption rather than being channeled into investment. This paper seeks to establish what proportion of foreign assistance is used to finance current consumption. The principal hypothesis to be tested is that aid transfers include very heterogeneous components with different marginal propensities to raise consumption. Estimating the average marginal propensity to consume of all the components of aid, as is commonly done, may lead to erroneous results. *Econ. J.*, June 1987 97(386), pp. 446-58. Hebrew University of Jerusalem.

## 500 Administration; Business Finance; Marketing; Accounting

### 510 ADMINISTRATION

#### 511 Organization and Decision Theory

**Ribhegge, Hermann**—Genossenschaftsgesinnung in entscheidungslogischer Perspektive (The "Cooperative Spirit" Viewed in Terms of Economic Decision Theory)

It is shown that certain attitudes within cooperative organizations, often characterized as a "cooperative spirit" that would characterize the "homo cooperativus," fit well into the familiar model of the "homo oeconomicus." To show this, the preferences, constraints and decision rules of a cooperative's member are analyzed. It is demonstrated that "cooperative behavior" is rational when cooperatives are long-living organizations. Reciprocal behavior that is based on anticipation that services rendered in advance will be remunerated later may create a sense of solidarity within the cooperative that discriminates free rider behavior and will stabilize the cooperative organization. *Kyklos*, 1986, 39(4), pp. 574-95 (German). Institut für Genossenschaftswesen, Westfälische Wilhelms-Universität, Münster, Germany.

#### 512 Managerial Economics

**Haller, Hans**—Market Power, Objectives of the Firm, and Objectives of Shareholders

Competition plays a crucial role in the normative theory of firms' objectives. In a formal example with a monopolist, it is shown that shareholders disagree on the firm's objectives despite a complete system of markets. Price normalization determines the net market-value maximizing production plan. *J. Inst. Theoretical Econ.*, Dec. 1986, 142(4), pp. 716-26. Virginia Polytechnic Institute and State University.

### 520 BUSINESS FINANCE AND INVESTMENT

**Klammer, Thomas P. and Walker, Michael C.**—Capital Budgeting Questionnaires: A New Perspective

The commonly-held belief that large business entities increasingly are adopting sophisticated capital-budgeting techniques is based primarily on the results of numerous questionnaire surveys. There has been debate over the validity of using unrelated questionnaire data to reach

conclusions about trends in capital-budgeting practices. This paper presents new evidence that suggests that the conclusions about trends in capital-budgeting practices drawn from a variety of questionnaire surveys are reasonably valid. It also lends support to the practice of using multiple time-series surveys to indicate trends in general. *Quart. J. Bus. Econ.*, Summer 1987, 26(3), pp. 87-95. North Texas State University; University of Cincinnati.

### 521 Business Finance

**Ambarish, Ramasastry; John, Kose and Williams, Joseph**—Efficient Signalling with Dividends and Investments

An efficient signaling equilibrium with dividends and investment, or equivalently, dividends and either sales or repurchases of stock, is constructed and its properties are identified. Because corporate insiders can exploit two signals, the efficient mix minimizes dissipative costs. In equilibrium, many firms both distribute dividends and deviate from first-best investment. Also, the impact of dividends on stock prices is positive. By contrast, the announcement effect of new stock is negative for firms with private information primarily about assets in place and positive for firms with inside information mainly about opportunities to invest. *J. Finance*, June 1987, 42(2), pp. 321-44. University of Wisconsin; University of Chicago; New York University.

**Baskin, Jonathan B.**—Corporate Liquidity in Games of Monopoly Power

Cross-sectional variation in corporate liquidity within a sample of large U.S. corporations suggests that there are material effects from product market competition. The empirical evidence is consistent with an oligopolistic model wherein liquid assets are employed both to signal commitment to retaliate against market encroachment and to enable firms to rapidly preempt new opportunities. As predicted, firms with high valuation and spending on intangibles, in certain strategic positions, hold large stocks of liquid assets. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 312-19. Baruch College, City University of New York.

**Cheng, Joseph K.**—Depreciation, Debt, and Equilibrium Tax Rates: A Reconsideration

How debt financing affects the effective corporate tax rate during a period of inflation will depend on the relative taxation of corporate income, equity income, and interest income. It has been shown previously that, given Merton Miller's (1977) position of debt neutrality in valuation and the related tax-rate equilibrium, debt financing accelerates the effective tax rate. This article observes that current theory and evidence tend to suggest rather a positive value of leverage and, thus, an alternative tax-rate equilibrium. It then shows that, because of this alternative tax-rate relationship, debt financing will likely be beneficial. *Quart. Rev. Econ. Bus.*, Spring 1987, 27(1), pp. 6-15. Simon Frazer University.

**Jahera, John S., Jr.; Lloyd, William P. and Page, Daniel E.**—Firm Diversification and Financial Performance

Diversification by shareholders has long been recognized as a rational response by risk-averse investors to the hazards of common stock ownership. The merits of diversification by corporations are much less obvious in light of the ease of shareholder diversification. This study examines the relationship between corporate diversification and financial performance while controlling for size. Such control is necessary owing to the well-documented small firm effect. The empirical results indicate a relationship between performance and corporate diversification when size is held constant. *Quart. Rev. Econ. Bus.*, Spring 1987, 27(1), pp. 51-62. Auburn University.

### 522 Business Investment

**Majd, Saman and Pindyck, Robert S.**—Time to Build, Option Value, and Investment Decisions

Investment decisions and outlays are often made sequentially. For example, the rate at which construction proceeds is usually flexible and can be adjusted with the arrival of new information. Traditional discounted cash-flow methods which treat the pattern of investment as fixed ignore this flexibility and understate the value of the project. This paper uses contingent claims analysis to derive optimal decision rules and to value such investments. The authors determine the effects of time to build,

opportunity cost, and uncertainty on the investment decision. For reasonable parameter values, they show how a simple NPV rule can lead to gross errors. *J. Finan. Econ.*, Mar. 1987, 18(1), pp. 7-27. University of Pennsylvania; Massachusetts Institute of Technology.

### 530 MARKETING

#### 531 Marketing and Advertising

Nguyen, Dung—Advertising Random Sales Response, and Brand Competition: Some Theoretical and Econometric Implications

This paper examines implications for the firm's advertising decisions under conditions of random sales response to advertising within the context of multibrand competition. The competitive environment assumed is characterized not only by interactions among different companies within a given industry, but also by interactions among different brands produced by a single company. A theoretical model is first formulated to examine the effect of uncertainty in the sales-advertising relations and that of the firm's attitude toward risk on its advertising. The theoretical results are then assessed by estimating an econometric model using the cigarette data. *J. Bus.*, Apr. 1987, 60(2), pp. 259-79. University of Pittsburgh.

### 600 Industrial Organization; Technological Change; Industry Studies

#### 610 INDUSTRIAL ORGANIZATION AND PUBLIC POLICY

#### 611 Market Structure: Industrial Organization and Corporate Strategy

Ashenfelter, Orley and Sullivan, Daniel—Nonparametric Tests of Market Structure: An Application to the Cigarette Industry

The revealed preference approach is used to construct a nonparametric test of the monopoly model and some simple generalizations of it, and the test is applied to data for the cigarette industry. It exploits the maintained hypothesis that variations in the excise tax charged on a package of cigarettes allow us to assess seller reactions to common exogenous variations in marginal cost. Results indicate that the monopoly hypothesis, and other simple models that do not embody at least a moderate amount of

competition, serve as poor predictors of the effects of excise-tax changes on cigarette prices, sales, and revenues. *J. Ind. Econ.*, June 1987, 35(4), pp. 483-98. Princeton University; Northwestern University.

Bresnahan, Timothy F. and Schmalensee, Richard—The Empirical Renaissance in Industrial Economics: An Overview

This brief essay introduces a special issue of the *Journal of Industrial Economics* devoted to the recent burst of empirical work in industrial organization. Trends in empirical research in this field are discussed, emphasizing the ways in which recent work builds upon and departs from earlier traditions. The papers in this special issue, which exemplify these developments, are briefly discussed. *J. Ind. Econ.*, June 1987, 35(4), pp. 371-78. Stanford University; Massachusetts Institute of Technology.

Cubbin, John and Ceroski, Paul—The Convergence of Profits in the Long Run: Inter-firm and Inter-industry Comparisons

This paper considers the extent to which the short-run dynamic behavior and long-run equilibrium levels of profitability differ among firms within the same industry. Movements in profits are modeled in terms of firm specific deviations from average industry profits, and industry specific deviations from economy-wide average returns. Applied to a sample of 217 large U.K. firms, 1951-77, the results suggest that considerable heterogeneities exist within most industries. That is, most firms' profitability experience differs considerably from those of their closest rivals. *J. Ind. Econ.*, June 1987, 35(4), pp. 427-42. Queen Mary College, London; University of Southampton.

Domowitz, Ian; Hubbard, R. Glenn and Petersen, Bruce C.—Oligopoly Supergames: Some Empirical Evidence on Prices and Margins

This paper is a panel data study on the behavior of prices and margins of oligopolies involved in repeated games. The authors examine two supergame models which generate very different predictions about the cyclical behavior of prices and margins. Evidence on the levels of price-cost margins indicates that oligopolies

achieve equilibria that more closely resemble a one-shot Cournot-Nash outcome than monopoly. The authors find, however, that industries with "high" price-cost margins exhibit cyclical price behavior which is quite different from that of unconcentrated industries. Little evidence of price wars during either recessions or booms is found. *J. Ind. Econ.*, June 1987, 35(4), pp. 379-98. Northwestern University.

**Dow, Gregory K.—The Function of Authority in Transaction Cost Economics**

This paper questions the transaction-cost characterization of observed authority relations as efficient governance structures. Various inadequacies in the transaction-cost account of work organization and the limits of firm size are traced to its neglect of the possibility that authority may be abused opportunistically. This exemplifies a more general propensity in the transaction-cost literature: that of explaining economic organization in functionalist terms, with little attention to the causal mechanisms through which efficient governance structures might actually arise. Three such mechanisms are considered, but none is found to provide an adequate rationale for the imputation of efficiency to observed structures. *J. Econ. Behav. Organ.*, Mar. 1987, 8(1), pp. 13-38. University of Alberta.

**Evans, David S.—The Relationship between Firm Growth, Size, and Age: Estimates for 100 Manufacturing Industries**

This study uses a sample of all firms operating in 100 manufacturing industries to examine some aspects of firm dynamics. It finds that firm growth, the variability of firm growth, and the probability that a firm will fail decrease with firm age. It also finds that firm growth decreases at a diminishing rate with firm size even after controlling for the exit of slow-growing firms from the sample. Gibrat's Law therefore fails, although the severity of the failure decreases with firm size. *J. Ind. Econ.*, June 1987, 35(4), pp. 567-81. Fordham University.

**Hoch, Róbert—The Maxi and the Mini (Reflections on the Hungarian Debate on Large Firms)**

In economic policy, changes in fashion may entail severe consequences. In the 1950s and

1960s the political leadership's preference for large firms led to an overcentralization of the state sector. More recently, the advantages of small enterprises seem to be overemphasized. One of the worst shortcomings of the Hungarian regulatory system is its bias against large enterprises. First of all, they are handicapped in respect of wage payment possibilities. As a result of further steps aimed at modernizing the system of economic control, this kind of discrimination has to be ended. *Acta Oecon.*, 1985, 35(3-4), pp. 251-67. Institute of Economics, Hungarian Academy of Sciences, Budapest.

**Kantarelis, D. and Veendorp, E. C. H.—Buyer Concentration and Countervailing Power**

An alternative measure of buyer concentration in manufacturing industries is proposed and used to explore the relationship between buyer and seller concentration for different subsets of manufacturing industries using data for 1977. The results suggest that the relationship between buyer and seller concentration is a nonlinear one and offer no support for the countervailing power hypothesis. *Quart. J. Bus. Econ.*, Summer 1987, 26(3), pp. 42-56. Assumption College; Clark University.

**Lieberman, Marvin B.—Excess Capacity as a Barrier to Entry: An Empirical Appraisal**

This paper examines excess-capacity barriers to entry and investment dynamics in a sample of thirty-eight chemical product industries. Logit and log-linear models of investment behavior are estimated, and specific case examples are considered. The results show that incumbents rarely built excess capacity preemptively in an effort to deter entry. In general, entrants and incumbents exhibited similar investment behavior. *J. Ind. Econ.*, June 1987, 35(4), pp. 607-27. Stanford University.

**Paba, Sergio—'Brand-naming' as an Entry Strategy in the European White Goods Industry**

This paper focuses on a particular type of export sale of manufactured goods: the supply of final products to a foreign firm which produces the same or similar goods and which mar-

kets this prearranged supply under its own brand labels. Such "brand-naming" agreements cannot be described either as a typical subcontracting agreement or as a simple cooperative arrangement between independent firms. The aim of this study is to show how the use of this practice, as an entry strategy into markets protected by high product differentiation barriers due to brand asymmetries, helped the Italian white goods industry to rise to world prominence. *Cambridge J. Econ.*, Dec. 1986, 10(4), pp. 305-18. University of Modena, Italy.

Révész, Gábor—On the Expansion and Functioning of the Direct Market Sector of the Hungarian Economy

The private small-scale activities, and partly the small and medium ventures operating in the framework of large socialist organizations, are characterized by their self-restraint and by the half-heartedness of the authorities toward them. This braked character and lack of trust in the future are causes of a particular monopolistic position and, frequently, of adventurism. These consequences can only be overcome by integrating this sector into the whole of the economy. *Acta Oecon.*, 1986, 36(1-2), pp. 105-21. Institute of Economics, Hungarian Academy of Sciences, Budapest.

Schmalensee, Richard—Collusion Versus Differential Efficiency: Testing Alternative Hypotheses

The predictions of collusion- and efficiency-based static equilibrium explanations of interindustry profitability differences are formally developed and tested, using appropriate econometric techniques, with intraindustry data on seventy U.S. Internal Revenue Service minor manufacturing industries in 1963 and 1972. None of the explanations has much explanatory power. The 1963 data are consistent with collusion-based models, while the 1972 data are inconsistent with all non-null hypotheses considered. Patterns of profitability are sharply different in the two years, in complex ways apparently unrelated to cyclical forces or the Phase II price controls. Implications of these results are discussed. *J. Ind. Econ.*, June 1987, 35(4), pp. 399-425. Massachusetts Institute of Technology.

Slade, Margaret E.—Interfirm Rivalry in a Repeated Game: An Empirical Test of Tacit Collusion

Rivalry in the Vancouver retail gasoline market is modeled as a repeated game. Service-station demand, cost, and intertemporal reaction functions are estimated from daily data on individual station prices, costs, and sales. These functions are then used to calculate noncooperative and cooperative solutions to the constituent game and the actual outcome of the repeated game. The actual outcome is found to be substantially less lucrative than the monopoly solution. Nevertheless, all stations are better off than if they played their noncooperative strategies in every period. *J. Ind. Econ.*, June 1987, 35(4), pp. 499-516. University of British Columbia.

Storey, D. J. and Jones, A. M.—New Firm Formation—A Labour Market Approach to Industrial Entry

This paper argues that a major local factor influencing the rate of new-firm formation is the rate at which jobs are shed in that locality. The evidence presented shows that in Northern England there appears to be no association between changes in, or absolute national levels of, profitability in the *i*th industry and new firm formation rates in that industry. On the other hand, formation rates in the *i*th industry in the region are positively correlated with job shedding. *Scot. J. Polit. Econ.*, Feb. 1987, 34(1), pp. 37-51. University of Newcastle-upon-Tyne.

612 Public Policy toward Monopoly and Competition

Smith, W. James; Vaughan, Michael B. and Formby, John P.—Cartels and Antitrust: The Role of Fines in Deterring Violations at the Margin

This paper investigates the role of fines and damages in deterring illegal price fixing at the margin. Proportional fines, of which treble damages are an example, are rejected as ineffective. Fines based entirely upon monopolistic overcharge or monopoly profit are also rejected because they at times promote, rather than reduce, restriction of trade. A fine's effect depends upon a subtle interaction between fine progressivity, the Department of Justice's case-

bringing strategy and the structure of marginal cost. The authors suggest that fine progressivity be determined on the basis of welfare loss with damages levied on monopoly profit as an efficient alternative to the present system. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 985-96. Weber State College; Weber State College; University of Alabama.

#### 613 Regulation of Public Utilities

**Bernard, Jean-Thomas and Cairns, Robert D.**—On Public Utility Pricing and Forgone Economic Benefits

G. Jenkins (1985) argues that the special relationships between the provincial governments and their publicly-owned electric utilities have led to overuse of capital in the electric power industry and hence to significant economic waste. His analysis ignores the particular circumstances of electricity price setting in the Canadian institutional context. Furthermore, he borrows two key technological parameters from a U.S. study: scale economies and factor substitution. He neglects the important role played in Canada by hydro resources. Other estimates exist suggesting that Jenkins's evaluation most probably errs on the high side. *Can. J. Econ.*, Feb. 1987, 20(1), pp. 152-63. Université Laval, Montreal; McGill University, Montreal.

#### 614 Public Enterprises

**Hensher, David A.**—Privatisation: An Interpretative Essay

This paper discusses some of the objectives of privatization and issues that are central to the debate on the wisdom of privatization. These issues include: the relationship between asset ownership and the competitive environment; the spreading ownership of productive assets; the role of regulation ("protective" privatization); and alternatives to asset sale such as competitive bidding to contract out a service. *Australian Econ. Pap.*, Dec. 1986, 25(47), pp. 147-74. Macquarie University, Australia.

**Levy, Brian**—A Theory of Public Enterprise Behavior

Unresolved conflict among competing goals induces factions external to public enterprises

to intervene in enterprise management, thereby reducing the level of effort expended by managers. Yet intervention can be a rational mechanism for inhibiting managers from capturing the enterprises for their own ends. A formal model explores the equilibrium that results from the interactions between the maximizing decisions of managers and of controllers. The model is extended to analyze strategic buffering by managers and to identify alternative dynamic sequences that might characterize manager-controller interactions. It provides a basis for discussing policy options for controlling public enterprises. *J. Econ. Behav. Organ.*, Mar. 1987, 8(1), pp. 75-96. Williams College.

#### 616 Industrial Policy

**Succar, Patricia**—The Need for Industrial Policy in LDC's—A Re-statement of the Infant Industry Argument

This paper presents a learning-by-doing model of a small open economy. Learning acquired in production of an industry  $x$  enhances productivity of industries  $x$  and  $y$ . By introducing dynamic production complementarities across industries through the learning curve, this approach presents an important generalization of P.K. Bardhan's 1971 model. *Int. Econ. Rev.*, June 1987, 28(2), pp. 521-34. University of Maryland.

#### 619 Economics of Regulation

**Holcombe, Randall G. and Holcombe, Lora P.**—The Market for Regulation

Consumers demand regulation of product quality when some important aspects of quality are difficult to observe, as is, for example, the case with restaurant sanitation or medical services. Advertising cannot convey adequate information in these cases because firms have an incentive to always represent themselves as meeting standards that are difficult to observe. Although regulation is demanded, private regulatory firms will arise in markets where there is adequate demand for regulation and where government regulation does not exist. Best Western Motels is used as an example of a private regulatory agency. *J. Inst. Theoretical Econ.*, Dec. 1986, 142(4), pp. 684-96. Auburn University.

## 620 ECONOMICS OF TECHNOLOGICAL CHANGE

## 621 Technological Change; Innovation; Research and Development

**Bond, Eric W. and Samuelson, Larry**—Durable Goods, Market Structure and the Incentives to Innovate

A commonly-cited finding in the innovation literature is that a monopoly tends to innovate too little. This paper demonstrates that a monopoly may devote more resources to innovation than is socially optimal if it produces a durable good. This possibility occurs because durability creates new innovation incentives. Once an initial stock of a durable good has been produced, the monopoly faces a residual demand for the good. Innovation may allow the monopoly to more profitably exploit this residual demand, and this ability may lead the monopoly to devote more resources to innovation than is socially optimal. *Economica*, Feb. 1987, 54(213), pp. 57–67. Pennsylvania State University.

**Cohen, Wesley M.; Levin, Richard C. and Mowery, David C.**—Firm Size and R&D Intensity: A Re-examination

Using data from the Federal Trade Commission's Line of Business Program and survey measures of technological opportunity and appropriability conditions, this paper finds that overall firm size has a very small, statistically-insignificant effect on business unit R&D intensity when either fixed industry effects or measured industry characteristics are taken into account. Business unit size has no effect on the R&D intensity of business units that perform R&D, but it affects the probability of conducting R&D. Business unit and firm size jointly explain less than 1 percent of the variance in R&D intensity; industry effects explain nearly half the variance. *J. Ind. Econ.*, June 1987, 35(4), pp. 543–65. Carnegie-Mellon University; Yale University; Carnegie-Mellon University.

**Gottinger, Hans W.**—Economic Choice and Technology Diffusion in New Product Markets

This essay models and estimates diffusion paths for a limited set of high-technology markets. The basic presupposition is that there is

an intrinsic relation between diffusion patterns and market dynamics. It is assumed that a firm is faced with the discrete choice of entry or non-entry (exit or non-exit) and that the choice probabilities depend on economic parameters determining the period for the speed of diffusion. The model which identifies strategic factors for a small spectrum of diffused product/process technologies also serves as a forecasting model for emerging targeted technologies in related industries. *Weltwirtsch. Arch.*, 1987, 123(1), 93–120. University of Virginia.

**Grossman, Gene M. and Shapiro, Carl**—Dynamic R&D Competition

The authors study a simple, two-stage, stochastic patent race involving two firms. They examine the behavior of the participants as they gain the lead or fall behind in the race. The authors find that the leader engages in R&D more intensively than does the follower, and that both firms intensify their efforts if the follower does catch up with the leader. They also analyze: (1) the attractiveness of licensing, whereby the leader shares his results with the follower; (2) a policy of issuing patents for intermediate research results; and (3) the effects of research joint ventures, whereby the firms coordinate their initial research efforts and share their results. *Econ. J.*, June 1987, 97(386), pp. 372–87. Woodrow Wilson School, Princeton University.

**Mark, Jerome A.**—Technological Change and Employment: Some Results from BLS Research

The Bureau of Labor Statistics has been studying technological change and its impact on the work force for a long time. Assessing the impact of technology is very complex. Technological changes interact with, and are affected by, changes in output, consumption patterns, international competition, and other factors, and the relationship between changing technology and employment is by no means clear. Although the Bureau's studies do not provide comprehensive answers about any relationship, they do yield useful insights. This article reports on some of the findings of these studies. It tentatively concludes that changing technology is not incompatible with employment growth.

*Mon. Lab. Rev.*, Apr. 1987, 110(4), pp. 26-29. Bureau of Labor Statistics, Washington, D.C.

**McHugh, Richard and Lane, Julia**—The Role of Embodied Technological Change in the Decline of Labor Productivity

This article accounts for the role of changes in the rate of embodied technological advancement in the productivity slowdown of the 1970s and finds that embodied technological changes appear to have accelerated over that time period. On the other hand, disembodied technological change slowed considerably. These results are obtained from a direct estimation of a vintage production function in which the coefficient on the age of capital captures embodiment effects. Unlike earlier studies, the age is measured with an adjustment for the probable idling of older capital during periods of less than full utilization. *Southern Econ. J.* Apr. 1987, 53(4), pp. 915-24. University of Missouri; University of Louisville.

**Zimmerman, Klaus F.**—Trade and Dynamic Efficiency

This paper studies possible impacts of international trade on domestic innovative activity. In the light of Schumpeterian ideas of dynamic efficiency, observed evidence of a positive relationship between static efficiency and trade may be undesirable. The paper examines the question by means of an econometric analysis of a huge data set of individual firms. The findings are: exporting reduces the effect of firm size on process innovations; and import competition, a larger integration in the foreign markets, and external demand support innovative activity. *Kyklos*, 1987, 40(1), pp. 73-87. University of Mannheim and University of Pennsylvania.

### 630 INDUSTRY STUDIES

**631 Industry Studies: Manufacturing**

**Ahmed, Ziaul Z. and Sieling, Mark**—Two Decades of Productivity Growth in Poultry Dressing and Processing

Output per employee hour in the poultry dressing and processing industry rose at an average annual rate of 2.9 percent between 1963 and 1984. In the early 1970s, automated machines were widely installed and helped hold down employee hours as output increased. By the late 1970s, most of the gains stemming from

this automation had been realized and output gains were often matched or exceeded by increases in employee hours. Between 1980 and 1984, productivity again rose at a rapid pace, reflecting growing consumer demand, higher valued products, new processing techniques, and streamlined Federal inspection procedures. *Mon. Lab. Rev.*, Apr. 1987, 110(4), pp. 34-39. Bureau of Labor Statistics, Washington, D.C.

**Berthelemy, Jean-Claude; Devezeaux de Lavergne, Jean-Guy and Ladoux, Norbert**—Une analyse de la dynamique des comportements de substitution de facteurs dans cinq branches de l'économie française (An Analysis of the Dynamics of Inputs Substitution in Five Sectors of French Economy)

In this study, the authors introduce adjustment terms in the classic translog formulation. They thus obtain a dynamic form of the usual value shares of inputs. Unlike other studies of this type, they consider that quantities, but not values, are rigid. The retained functional form was estimated in five industrial sectors of the French economy. The results obtained allow an analysis of the evolution over a period of time (1959-1982), as well as a comparison between the different sectors, of the elasticities of substitution in the long and short run. *Ann. Econ. Statist.*, Oct./Dec. 1986, (4), pp. 3-22 (French). Laboratoire d'Économie Politique; Commissariat à l'Énergie Atomique and University of Paris-I; Commissariat à l'Énergie Atomique and GREMAQ.

**Bresnahan, Timothy F.**—Competition and Collusion in the American Automobile Industry: The 1955 Price War

Movements in total quantity and in quality-adjusted price suggest a supply-side shock in the American automobile market in 1955. This paper tests the hypothesis that the shock was a transitory change in industry conduct, a price war. The key ingredients of the test are alternative equilibrium models of oligopoly under product differentiation. In nonnested (Cox) tests of hypotheses, a collusive solution is sustained in 1954 and in 1956, while a competitive solution holds in 1955. The result does not appear to be an artifact, since it is robust in tests against

alternative specifications. *J. Ind. Econ.*, June 1987, 35(4), pp. 457-82. Stanford University.

**Hall, Bronwyn H.**—The Relationship between Firm Size and Firm Growth in the U.S. Manufacturing Sector

Using panel data on the publicly traded firms in the U.S. manufacturing sector in the recent past, the author finds that most of the change in employment at the firm level in any given year is permanent, that year-to-year growth rates are largely uncorrelated over time or with prior characteristics of the firm, and that there is almost no measurement error. Gibrat's Law is weakly rejected for the smaller firms in the sample and accepted for the larger firms. This finding remains when the author controls for the effect of selection (attrition) on estimates obtained from this sample. *J. Ind. Econ.*, June 1987, 35(4), pp. 583-606. Stanford University.

**O'Neil, Barbara A.**—The Mining Machinery Industry: Labor Productivity Trends, 1972-84

Productivity in the mining-machinery industry, as measured by output per hour of all persons, declined at an average annual rate of 1.2 percent from 1972 to 1984. Producing heavy machinery and equipment for the mining of ores and coal, the industry has felt the effects of falling coal prices, fuel shortages, and energy crises over the past 10 to 15 years. The general decline of U.S. mining has led mining companies to retrofit and rebuild existing machinery rather than purchase new equipment. Future productivity improvements will depend on increased demand and wider diffusion of computer-assisted design and manufacturing systems. *Mon. Lab. Rev.*, June 1987, 110(6), pp. 31-36. Bureau of Labor Statistics, Washington, D.C.

**Struckmeyer, Charles S.**—The Putty-Clay Perspective on the Capital-Energy Complementarity Debate

This paper argues that capital-energy complementarity is a short-run phenomenon reflecting the fixed *ex post* nature of factor employment in a putty-clay technology. When an empirical specification is employed that measures firms' *ex ante* choice of technique, capital and energy are found to be long-run substitutes.

However, further analysis of the standard translog and putty-clay models with nonnested hypothesis tests reveals that neither specification is an adequate representation of technology. The results suggest that there is a dynamic adjustment process in the data that is not fully captured in either model. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 320-26. Board of Governors of the Federal Reserve System, Washington, D.C.

**632 Industry Studies: Extractive Industries**

**Hendricks, Kenneth; Porter, Robert H. and Boudreau, Bryan**—Information, Returns, and Bidding Behavior in OCS Auctions: 1954-1969

This paper examines federal auctions for leases on the Outer Continental Shelf in the light of the predictions of the first-price, sealed-bid, common-values model of auctions. The authors find that the data strongly support the model for auctions in which one bidder is better informed than the other bidders. The evidence for auctions in which bidders have noisy, but qualitatively similar, information is less conclusive but is consistent with a model in which each bidder does not know either the actual or potential number of bidders on a lease. *J. Ind. Econ.*, June 1987, 35(4), pp. 517-42. State University of New York at Stony Brook.

**633 Industry Studies: Distributive Trades**

**Herman, Arthur S. and Henneberger, J. Edwin**—Productivity Trends in the Furniture and Home Furnishings Stores Industry

Productivity, as measured by output per hour of all persons, grew at an average rate of 3.0 percent in the furniture and home furnishings stores industry from 1967 to 1985. Productivity grew at the high rate of 4.6 percent in the appliance, radio, and television stores component, while increasing at less than half that rate, 1.9 percent, in the furnishings component. The industry shifted toward more chain store operations and introduced such innovations as computerized point of sale equipment and companywide computer systems for inventory control, product reordering, and advertising campaigns which aided productivity growth. *Mon. Lab. Rev.*, May 1987, 110(5), pp. 24-29. Bureau of Labor Statistics, Washington, D.C.

## 634 Industry Studies: Construction

**Schulze, William D., et al.—Benefits and Costs of Earthquake Resistant Buildings**

There is concern about whether the cost of earthquake resistant buildings justify their benefits. The authors examine this by deriving a community's willingness-to-pay for resistant buildings. Geological evidence on the San Andreas Fault is utilized to obtain a probability density function for an earthquake. The probability of an earthquake is shown to increase over time which has an offsetting effect on discounting future benefits. At the present, for a wide range of discount rates, the expected benefits of earthquake resistant buildings exceed their costs in Los Angeles County. However, this result varies with the elapsed time since the last earthquake. Coauthors are David S. Brookshire, Ronda K. Hageman, and John Tschirhart. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 934-51. University of Colorado.

## 635 Industry Studies: Services and Related Industries

**Claggett, E. Tylor, Jr.—Cooperative Distributors of Electrical Power: Operations and Scale Economies**

Cooperative distributors of electricity serve more than twenty-five million customers, yet relatively few researchers have scrutinized cooperative firms or isolated electrical power distributions. This study attempts to examine both topics simultaneously. The objectives of the study are to: (1) describe cooperative electrical distributors and the operations; (2) determine scale economies within their enterprise; and (3) quantify their past cost disadvantages. An unconventional output definition for power distribution firms is developed and used in conjunction with a CES production function. The investigation reveals increasing returns to scale and the implied cost disadvantages for the selected sample of cooperative distributors. *Quart. J. Bus. Econ.*, Summer 1987, 26(3), pp. 3-21. University of Texas—Medical Branch, Galveston.

**Gutermann, Karl L. and Smith, Richard L.—Efficiency of the Market for Residential Real Estate**

Property value data for fifty-seven metropolitan areas are used to test the efficiency of the residential real estate market. Results based on estimated abnormal returns indicate a potentially exploitable market imperfection but the amount of systematic variation is not sufficient to offset transactions costs. Additionally, trading strategies based on historical rates of appreciation were compared to a buy-the-market strategy. A residential real estate portfolio with low average rates of capital appreciation in one period produced rates of appreciation in the next period that exceeded the average for the market. Again, once transactions costs are considered, evidence suggests that the real estate market is efficient. *Land Econ.*, Feb. 1987, 63(1), pp. 34-45. Arizona State University.

**Henriet, Dominique and Rochet, Jean-Charles—Some Reflection on Insurance Pricing**

The authors analyze three aspects of the recent evolution of French automobile insurance by use of three simple theoretical models: the fantastic development of professional mutuals; the growing complexity of tariffs; and the increasing recourse to product differentiation. Each of these aspects can be interpreted as a step further in the direction of increasing premiums personalization. The question the authors examine is: how far should we go? *Europ. Econ. Rev.*, June 1987, 31(4), pp. 863-85. Ecole Polytechnique, Paris and CNET, France; Ecole Polytechnique, Paris and University of Paris-IX.

**Schroeter, John R.—Competition and Value-of-Service Pricing in the Residential Real Estate Brokerage Market**

The services of residential real estate brokers are normally priced at a fixed percentage of the selling price of the house. Since the direct cost of selling a house is virtually unrelated to house value, this custom is an example of value-of-service pricing—a practice often regarded as *prima facie* evidence of collusive price discrimination. This article presents a simple model of the market for real estate brokerage services in which value-of-service pricing emerges as a property of competitive equilibrium. Thus, inferences of noncompetitive broker conduct,

based on the prevalence of percentage-of-house-value pricing, may be incorrect. *Quart. Rev. Econ. Bus.*, Spring 1987, 27(1), pp. 29-40. Iowa State University.

## 700 Agriculture; Natural Resources

### 710 AGRICULTURE

#### 711 Agricultural Supply and Demand Analysis

Csáki, Csaba—An Outlook of Food Supply and Demand in the CMEA Countries: Results of the ILASA/FAP Model System

In the framework of the Food and Agriculture Programme of the International Institute for Applied Systems Analysis, a series of computations has been made concerning the prospects of the food market in the CMEA countries. All of the four scenarios investigated reflect substantial growth potentials in the agricultural sector of these economies. The development of crop production, and especially of grain farming, is of outstanding importance, since several CMEA countries are heavy importers of food stuff. The objective of establishing food autarky set in these countries does not, however, serve the interest of the community nor the national interests of the member countries. *Acta Oecon.*, 1985, 35(1-2), pp. 145-64. Karl Marx University of Economics, Budapest.

Evans, Scott F. and Lewis, Philip E. T.—Demand, Supply and Adjustment of Farm Labour in Australia

In this paper a disequilibrium model of the Australian rural labor market is constructed and the demand, supply, and adjustment functions estimated. The results indicate that the market for farm labor can be described by traditional neoclassical analysis and that wages are very slow to adjust to disequilibrium. The results imply that increases in farm prices will not necessarily maintain or raise farm employment. The most important determinants of farm employment are wages relative to other input prices and off-farm wages. *Australian Econ. Pap.*, Dec. 1986, 25(47), pp. 236-46. Bureau of Agricultural Economics, Canberra, Australia.

Grabowski, Richard and Sanchez, Onesimo—Returns to Scale in Agriculture: An Empirical Investigation of Japanese Experience

In this paper a ray-homothetic production function is used to determine returns to scale for Japanese agriculture for the period 1878 to 1940. The advantage of the ray-homothetic function is that it allows returns to scale to vary with both output and factor intensity. The results show that for this period Japanese agriculture operated under conditions of increasing returns to scale. *Europ. Rev. Agr. Econ.*, 1986, 13(2), pp. 189-98. Southern Illinois University.

O'Connell, John—A Hedonic Price Model of the Paris Carcase Lamb Market

Based on a lamb carcass classification and pricing exercise in the Paris wholesale market at Rungis, an equation was estimated which regresses prices on farm-based and factory-based quality aspects and on country of origin of the carcasses. The revenue foregone per carcass by each supplying country, because of divergence from the optimal quality, is quantified and allocated to particular quality attributes. For all countries quality improvement would yield substantially increased revenue. Supplying countries other than France suffer a substantial country-of-origin discount which is not justified on quality considerations. Further research is necessary on this phenomenon. *Europ. Rev. Agr. Econ.*, 1986, 13(4), pp. 439-50. University College, Dublin, Ireland.

Palm, F. C. and Vogelvang, E.—A Short-run Econometric Analysis of the International Coffee Market

The authors develop a short-run econometric model for the world coffee market and give empirical evidence on the behavioral equations of the model for the major coffee importing and exporting countries. The behavioral relationships for producers, inventory holders, speculators, and consumers are derived from optimizing considerations in an uncertain environment. Spot and futures prices adjust to clear the spot and futures markets at each period. International trade flows of coffee are determined by the optimizing behavior of the agents (countries) in the model. The empirical evidence confirms the authors' hypothesis of a highly structured model which is consistent with profit maximizing behavior under uncertainty. *Europ. Rev. Agr. Econ.*, 1986, 13(4), pp. 451-

76. State University Limburg, Maastricht, the Netherlands; Free University, Amsterdam.

**713 Agricultural Policy, Domestic and International**

**Alston, Julian M.**—The Effects of the CAP on International Trade in Poultry Meat

The Common Agricultural Policy (CAP) increases poultry production costs, prohibits poultry imports, and subsidizes poultry exports. An equilibrium displacement model is applied to analyze the effects of these policies. In the absence of the CAP it is likely that the European Community (EC) would be a net importer rather than a major exporter of poultry. The large implicit tax on EC poultry consumers is an inefficient means of transferring income to producers, and the policy has significant net costs. The displacement of U.S. exports, mainly to the Middle East, involves substantial cost to U.S. producers but these are almost entirely offset by gains to U.S. consumers. *Europ. Rev. Agr. Econ.*, 1986, 13(2), pp. 217-31. Department of Agriculture, Victoria, Australia.

**Alvarez-Coque, J. M. G. and Barcelo, L. V.**—The Welfare Evaluation of the Spanish Price Policy: An Integrated Approach

The use of the economic surplus measures has been widespread in the welfare evaluation of trade distortions in agricultural markets. However, the criterion based on the sum of surplus areas can be ambiguous since it usually involves the implicit acceptance of a restrictive class of value judgments. This article approaches the evaluation of the Spanish agricultural pricing policy by means of A. Atkinson's (1970) welfare function, that makes clear the trade-off between efficiency and equity, and explicitly includes the policy maker's inequality aversion. Optimum levels of protection are estimated at various inequality-aversion levels. *Europ. Rev. Agr. Econ.*, 1987, 14(1), pp. 117-34. Polytechnical University of Valencia, Spain.

**Marsh, John S.**—Alternative Policies for Agriculture in Europe

Three different approaches to a reform of the agricultural policies are discussed. Tourniquet

solutions to solve the immediate problem of budget control, therapeutic solutions aiming at a stable and prosperous rural community while ensuring the further technological development of agriculture, and a catalytic approach in which agricultural policies are integrated in an overall political effort aimed at the further political and economic integration of the expanded European Community and the tackling of its important social and economic problems. *Europ. Rev. Agr. Econ.*, 1987, 14(1), pp. 11-21. University of Reading, United Kingdom.

**Meester, Gerrit**—Budgetary Constraints and International Realities in the CAP

The shift from net importer to net exporter marks a radical change in the economic environment within which the CAP operates. The proposed price reductions and co-responsibility levies may contribute to the solution of budgetary problems but have little to offer with respect to the solution of international trade conflicts and the improvement of the Community's terms of trade. Supply control measures, which are rejected by the Commission, will have the combined effect of alleviating the budgetary burden and of reducing the unfavorable trade effects for third-world countries and for the Community itself. *Europ. Rev. Agr. Econ.*, 1987, 14(1), pp. 37-47. Agricultural Economics Research Institute (L.E.I.), the Hague, the Netherlands.

**Tarditi, Secondo**—The 'Green Paper' in a Long-term Perspective

After a survey of the main financial and economic features of the Common Agricultural Policy and of the long-term development of the diversified structural situation of farming in the Community, the article summarizes the basic policy options presented in the *Green Paper*. In the concluding section, the budgetary consequences of the policy proposals are analyzed, and the need for a more balanced price support for the various products and a further geographical differentiation of the common policies according to economic and environmental conditions are advocated. *Europ. Rev. Agr. Econ.*, 1987, 14(1), pp. 23-35. University of Siena, Italy.

**de Veer, Jan—Perspectives for the CAP**

To provide background information, the contents of the *Green Paper* and the *Policy Orientations* in which the Commission of the European Communities presents its views on the future development of the Common Agricultural Policies, are summarized and discussed. First, an outline of the Community's institutional framework for agricultural policy making is given and the papers on agricultural policy reforms published by the Commission in previous years are surveyed. The article concludes with a description of the development of the Community's agricultural policy budget. *Europ. Rev. Agr. Econ.*, 1987, 14(1), pp. 1-10. Agricultural Economics Research Institute (L.E.I.), the Hague, the Netherlands.

**Weinschenck, Günther—The Economic or the Ecological Way? Basic Alternatives for the EC's Agricultural Policy**

The policy proposals presented in the *Green Paper* are not consistent with the stated objectives. They will not prevent a rapid decrease in the number of farms and the abolition of farming in the less-favored regions. After a systematic discussion of the various policy alternatives and their implications, a proposal is developed to reduce output by decreasing the use of yield-increasing inputs and to support farming in the less-favored areas by direct-income aids and retirement payments. The reduction in the use of yield-increasing inputs, particularly nitrogen, can be achieved by imposing a tax. This policy would not only reduce surplus production but would also encourage a less intensive and ecologically more desirable use of the land. *Europ. Rev. Agr. Econ.* 1987, 14(1), pp. 49-60. University of Hohenheim, West Germany.

**714 Agricultural Finance****Sakellis, M. G.—An Empirical Analysis of Savings Behaviour of the Greek Agricultural Households**

In this article, the author presents the results of an econometric cross-sectional analysis of determinants of the savings behavior of agricultural households in Greece. The estimates of bivariate and multivariate models indicate that: (1) the marginal propensity to save is higher

than the average propensity to save and is differentiated among classes of income, wealth, age and profession, income uncertainty mostly due to climatic variations, and educational level; (2) the hypothesis that income uncertainty in Greece, as in other countries, raises the marginal propensity to save can be supported; and (3) the disposable income is the most important factor affecting agricultural savings. *Europ. Rev. Agr. Econ.*, 1986, 13(2), pp. 169-88. Agricultural Bank of Greece.

**715 Agricultural Markets and Marketing****Boyd, Milton S. and Brorsen, B. Wade—Dynamic Price Relationships for U.S. and EC Corn Gluten Feed and Related Markets**

The dynamic relationship of U.S. and European Community prices of corn-gluten feed and related markets are investigated using time-series models. Results show that prices for Rotterdam corn-gluten feed and soybean meal markets are instantaneously related, and that these commodities behave as strong substitutes but behave as weak substitutes for West German barley. Thus, the results indicate that corn-gluten feed acts more like a protein supplement than a feed grain or energy substitute. Thus, proposed European community import restrictions on corn-gluten feed are more likely to result in increased imports of soybean meal or other protein supplements than increased use of European Community feed grain. *Europ. Rev. Agr. Econ.*, 1986, 13(2), pp. 199-215. Purdue University.

**716 Farm Management****Berg, Ernst—A Sequential Decision Model to Determine Optimal Farm-Level Grain Marketing Policies**

This paper deals with the development of models to support postharvest grain-marketing decisions. These multi-stage decision models compute optimal closed-loop sales policies based on subjective assessments of the probability distributions of future prices. The first approach assumes that the decision maker is risk indifferent. Later on the model is expanded in order to maximize expected utility to capture risk aversion as well. The impacts of different degrees of risk aversion on the optimal policy are analyzed and conclusions are drawn with

respect to the model application in practical decision making. *Europ. Rev. Agr. Econ.*, 1987, 14(1), pp. 91-116. University of Bonn, West Germany.

**Hanf, C.-H. and Kühl, Rainer**—Possibilities and Limits of Individual Marketing on Family Farm Firms

Agricultural marketing is usually regarded as the affair of special institutions created to improve the situation of the whole sector. However, any farm has at its disposal a bundle of marketing activities to improve its economic situation. Generally these activities aim at a reduction of input prices and/or an increase of the farm-gate output prices. The paper deals with these possibilities and gives some first approximations of the profit increases which could be attributed to improvements of individual marketing activities. *Europ. Rev. Agr. Econ.*, 1986, 13(2), pp. 149-67. Agricultural University of Vienna; University of Kiel, W. Germany.

**Higgins, James**—Input Demand and Output Supply on Irish Farms—A Micro-economic Approach

In this paper a profit-function approach is used to derive a set of input-demand and output-supply equations, the parameters of which are used to estimate a set of own and cross price elasticities of demand and supply. Both compensated and uncompensated elasticity estimates are presented. The methodology used permitted the testing of some of the assumptions of the neoclassical theory of the firm. The data used are from a cross section of farms. While the empirical results did not meet some of the requirements of profit maximization, the methodology proved useful in describing the interrelationships between outputs and inputs. *Europ. Rev. Agr. Econ.*, 1986, 13(4), pp. 477-93. Agricultural Institute, Dublin, Ireland.

**Lianos, Theodore P. and Parliarou, Despina**—Farm Size Structure in Greek Agriculture

Although the average farm size in Greece has increased since 1960, there has been no decline in the percentage of farms in the smallest-sized group. The continued existence of these small farms can be attributed to part-time farming, and to the farm-family life cycle. In

addition, the lack of alternative investment opportunities retards the change in land ownership structure. The average farm size over regions is found to be negatively related to population pressure, positively related to industrialization, and positively related to mechanization. The EC structural policy, presently combined with restrictive price policy, is expected to stimulate average farm-size growth. *Europ. Rev. Agr. Econ.*, 13(2), pp. 233-48. Athens School of Economics and Business Science, Greece.

**717 Land Reform and Land Use**

**van Dijk, G.; Smit, L. and Veerman, C. P.**—Land Prices and Technological Development

Land prices in the Netherlands are strongly influenced by technological change in agriculture. These effects are described by applying the cost-push innovation hypothesis. Land prices are the outcome of a price-formation process. Market behavior and the sampling interval of the data (annual) require the use of a simultaneous-equations approach. The identification of demand and supply in such a model is discussed. The statistical results of simultaneous models for two regions in the Netherlands are presented. The estimated parameters do not lead to proper empirical identification of demand and supply. Recursive models yield better statistical results. *Europ. Rev. Agr. Econ.*, 1986, 13(4), pp. 495-515. Agricultural University, Wageningen, the Netherlands; Agricultural University, Wageningen, the Netherlands; Graduate School of Management, Rotterdam, the Netherlands.

**718 Rural Economics**

**Bauwens, A. L. G. M. and Douw, L.**—Rural Development: A Minor Problem in the Netherlands?

In the Netherlands there are no large areas with typical rural characteristics. Existing differences in culture and economic performance between more and less urbanized regions have gradually been reduced by economic development that was stimulated by regional policy. The main problem now is how the non-urban areas can fulfill the growing needs of urban residents and others concerning outdoor recreation, nature conservation, and landscape. The

development of policies and instruments of physical planning and rural reconstruction in recent years is closely linked with the above problems. *Europ. Rev. Agr. Econ.*, 1986, 13(3), pp. 343-66. Agricultural Economics Research Institute (L.E.I.), the Hague, the Netherlands.

**de Benedictis, Michele**—Italy: Fragmentation of Policies and Research Effort

In Italy, rural development is considered an autonomous area of teaching and research. A major portion of the literature is concerned with the description and interpretation of the regional and intersectoral impact of the postwar development process in Italy, placing substantial emphasis on the analysis of major phenomena and variables involved in this process (diffused versus concentrated industrialization, migration, part-time farming). The absolute lack of coordination among the several measures conceived to promote agricultural and industrial development underlines the absence of an overall policy for rural development. *Europ. Rev. Agr. Econ.*, 1986, 13(3), pp. 327-41. University of Rome.

**Brun, André**—France: Rural Development in a Dynamic Context

The process and mechanisms by which rural population, space, resources, equipment, production, and relevant social networks are evolving define a large field of investigation referred to by economists as "rural development." This loose definition leads the author to describe and interpret the main features of these changes and characterize the research phases in recent decades. Two orientations of research will be suggested, one on the systematization of simultaneous detailed spatial observations on demography, employment, land markets, agricultural production, and structures, the other dealing with conflicts arising when development projects are implemented or simply proposed. *Europ. Rev. Agr. Econ.*, 1986, 13(3), pp. 309-26. INRA, Orléans, France.

**Ceña, Felisa and Fernandez-Cavada, Jose Luis**—Spain: Rural Development under Rapid Depopulation

The concept of "development" was introduced in the Spanish economic literature and

in the policy debate during the 1950s. The most relevant literature may be grouped under the headings "Traditional Agriculture in Transition," "Impact of Economic Development in Rural Areas," "Migrations," and "Family Agriculture." Those areas of study form the framework of this review. The most significant factor in Spanish rural development is rapid depopulation of rural areas during the 1960s and 1970s, coinciding with significant nationwide industrialization resulting in general economic development. *Europ. Rev. Agr. Econ.*, 1986, 13(3), pp. 415-32. University of Cordoba; Polytechnical University of Madrid.

**Giessübel, Rainer and Spitzer, Hartwig**—Fed. Rep. of Germany: Rural Development under Federal Government

The development of rural areas should include the promotion of industry, infrastructure, and services as well as the conservation of the productivity and efficiency of the natural system, which should be assessed as an ecological potential of rural areas. Starting from this definition, the article is an attempt to review the theoretical conceptions, main problems, and planning activities concerned with rural development considering the institutional framework in West Germany. *Europ. Rev. Agr. Econ.*, 1986, 13(3), pp. 283-307. Institut für Landwirtschaftliche Betriebslehre, Regional und Umweltpolitik, Justus-Liebig Universität, Giessen, West Germany.

**Hodge, Ian D. and Whitby, Martin**—The U.K.: Rural Development, Issues and Analysis

This paper reviews the literature relating to rural development issues in Britain. The issues of depopulation and the decline of employment were dominant concerns in rural development up to the mid-1970s. Since then, the phenomena of counterurbanization and the urban-rural manufacturing shift, and their consequences for rural areas, have become major themes. Early studies relating to land use have been followed by applications to the issues of environmental change, settlement planning, and employment. The final section highlights some elements of the debate over policies for rural development and the institutional framework for their imple-

mentation. *Europ. Rev. Agr. Econ.*, 1986, 13(3), pp. 391-413. University of Cambridge; University of Newcastle-upon-Tyne.

**Matthews, Alan**—Ireland: Rural Development in an Agrarian Society

Problems of economic and social development dominate the Irish rural development literature. This article distinguishes five separate themes: the pattern of agricultural adjustment and its consequences for land use and demography; the evaluation of alternative means of creating employment in rural areas; the extent and pattern of social deprivation; the investigation of conflicts in the management of rural resources; and the potential of institutional innovation to tap local resources and initiative. The major contributions to each theme are discussed. *Europ. Rev. Agr. Econ.*, 1986, 13(3), pp. 367-89. Trinity College, Dublin.

## 720 NATURAL RESOURCES

### 721 Natural Resources

**Bell, Frederick W. and Leeworthy, Vernon R.**—Economic Demand for Marinas and Projected Impact on Wetlands

The demand for boating has created a derived demand for marinas and also wetlands. A three-equation model of marina demand was formulated consisting of an equation explaining boat registrations, a probability equation to predict marina use, and a wet-dry slip equation to predict the choice of marina services. The model was estimated for the State of Florida and used to forecast the demand for marinas and wetlands to the year 2000. Without institutional constraints, the forecast indicates that 1,897 acres of saltwater wetlands might be lost along the coast of Florida or 0.19 percent of existing wetlands which is a small quantitative impact; however, qualitative impacts were not explored. *Land Econ.*, Feb. 1987, 63(1), pp. 79-91. Florida State University; NOAA, Rockville, Maryland.

**Bjørndal, Trond and Conrad, Jon M.**—The Dynamics of an Open Access Fishery

A discrete-time, nonlinear, deterministic model for an open-access fishery is developed and the equilibrium is characterized. The open-

access exploitation of North Sea herring during the period 1963-77 is analyzed. Alternative production functions are considered and estimated for the Norwegian purse seine fishery. The bionomic equilibrium and approach dynamics are presented when prices and costs are changing. The results indicate that the resource stock was saved from possible extinction by the closure of the fishery at the end of the 1977 season. *Can. J. Econ.*, Feb. 1987, 20(1), pp. 74-85. Norwegian School of Economics; Cornell University.

**Boadway, Robin, et al.**—Marginal Effective Tax Rates for Capital in the Canadian Mining Industry

The authors model a firm that explores, develops, and extracts a depletable asset, taking into account various features of Canadian corporate and Ontario and Quebec mining tax law. They derive the user cost of capital and effective tax rate for investments undertaken by a mining firm. Calculations based on 1985 tax law show that there is considerable dispersion in effective tax rates, most being negative, especially for processing assets. The authors conclude that these taxes have been very poor collectors of mining rents compared to a neutral cash flow tax. Coauthors are Neil Bruce, Ken McKenzie, and Jack Mintz. *Can. J. Econ.*, Feb. 1987, 20(1), pp. 1-16. Queen's University, Ontario.

**Bockstael, Nancy E. and Strand, Ivar E., Jr.**—The Effect of Common Sources of Regression Error on Benefit Estimates

Two potential sources of error in regression analysis are examined to understand their effect on benefit estimates. The alternative interpretations of the error as inaccurate measurement of the dependent variable or omission of relevant variables suggest different methods for calculating consumer surplus estimates from estimated equations. Both methods have been used in the literature, yet they yield different consumer surplus estimates. An expression reflecting this difference is developed for a given sample. Additionally, the expected value of the difference is derived for the case in which the sample has yet to be drawn. The omitted variables interpretation is shown to lead to larger benefit estimates than the measurement error

interpretation. *Land Econ.*, Feb. 1987, 63(1), pp. 11-20. University of Maryland.

**Clifford, Norman and Crawford, Vincent P.**—Short-term Contracting and Strategic Oil Reserves

The effect of short-term contracting on resource extraction is studied in a two-country model of international trade in oil. Countries' planners are fully rational, with perfect information and perfect foresight. Contracts are perfectly enforceable and complete, except that short-term contracts do not allow commitments to actions taken beyond the contract period. The authors show that short-term contracting limits countries' opportunities for intertemporal consumption smoothing, reducing their collective tolerance for temporal variation in consumption. This tends to make them extract more slowly than in the efficient plan that results from long-term contracting. *Rev. Econ. Stud.*, Apr. 1987, 54(2), pp. 311-23. University of Kansas; University of California, San Diego and Princeton University.

**Cory, Dennis C. and Saliba, Bonnie Colby**—Requiem for Option Value

Option value, the difference between option price and expected surplus, has been investigated by a variety of authors concerned with benefit estimation under conditions of demand uncertainty. A critical review of recent theoretical developments is presented in which it is argued that option value is only of peripheral concern in the economics of natural environments. Instead, theoretical and empirical work should focus on the difference between the expected value of fair-bet, contingent-claims payments and the empirically tractable expected surplus measure of site benefits. *Land Econ.*, Feb. 1987, 63(1), pp. 1-10. University of Arizona.

**Romero, Carlos and Rehman, Tahir**—Natural Resource Management and the Use of Multiple Criteria Decision-making Techniques: A Review

This paper attempts to improve the awareness in the agricultural economics profession of the potential role that multiple criteria decision-making (MCDM) techniques can play in analyzing problems involving several objec-

tives. Important applications of the MCDM techniques to planning and management problems in fisheries, forestry, water, and land resources are reviewed, and some 150 applications are brought together to provide a unified source of reference. *Europ. Rev. Agr. Econ.*, 1987, 14(1), pp. 61-89. University of Cordoba, Spain; University of Reading, United Kingdom.

**Schefter, John E.**—Increasing Block Rate Tariffs as Faulty Transmitters of Marginal Willingness to Pay

Increasing block-rate tariffs transmit inaccurate signals of the marginal willingness to pay (MWTP) of consumers whose MWTP falls between the prices in adjoining rate blocks at the level of consumption associated with the inter-block boundary. Thus, the estimated parameters of demand functions for goods sold under such tariffs are, in general, biased. Simulation results suggest that failure to obtain hypothesized results under a Taylor-Nordin demand specification can, in part, be attributed to errors in the measurement of the MWTP of those consumers in the interblock price gap. *Land Econ.*, Feb. 1987, 63(1), pp. 21-33. U.S. Geological Survey, Reston, Virginia.

## 722 Conservation and Pollution

**Ashworth, John; Papps, Ivy and Storey, David**—Assessing the Impact upon the British Chlor-Alkali Industry of the EEC Directive on Discharges of Mercury into Waterways

In 1982 after protracted negotiations, the European Council of Ministers agreed on a Directive controlling aquatic discharges of mercury from the European chlor-alkali industry. By a substantial reduction in discharges, the U.K. industry can now comply with its terms, and this compliance has been hailed as a triumph for the Directive. This paper uses data provided by the U.K. industry and the authors' earlier estimation of the pollution discharge function to examine the extent to which this view is correct. It is found that, at most, 20 percent of the reduction in discharges may reasonably be attributed to the Directive. *Land Econ.*, Feb. 1987, 63(1), pp. 72-78. University of Durham, United Kingdom; University of Durham, United Kingdom; University of Newcastle-upon-Tyne.

inson, S. E. and Tietenberg, T. H.—Economic Implications of Emissions Trading Rules for Local and Regional Pollutants

In 1975 the United States Environmental Protection Agency initiated an historic process of regulatory reform, now known as the Emissions Trading Program. For nonuniformly distributed pollutants, such as sulfur dioxides, air quality is a function not only of the level of emissions, but their location and stack heights as well. The focus of this paper is how to protect local air quality and limit long-range pollutant deposition caused by emission trades, while allowing as much cost-reducing trading activity as possible. The authors examine the implications of two trading rules in two different sheds using programming simulation models. They find that the use of either trading rule represents a substantial improvement over relying exclusively on the current allocation of control responsibility. *Can. J. Econ.*, May 1987, 2), pp. 370-86. University of Georgia; Colby College.

#### Energy

and, Sudhir and Nalebuff, Barry—Issues in the Application of Cost-Benefit Analysis to Energy Projects in Developing Countries

This paper develops a theoretical framework to evaluate the benefits and costs of energy projects in oil-importing developing countries. It is used to address various questions: How would the problems of energy dependency and vulnerability be reflected in a project appraisal? Are there externalities not captured in the market price of the resource? Should royalty values be included in cost-benefit calculations? Why do the real prices of exhaustible resources rise over time? Should several energy-development projects be done simultaneously? What are the costs of stockpiling oil? Is there a need for coordinating information gathering and project diversification across countries? *Oxford Econ. Pap.*, Mar. 1987, 39(1), pp. 190-222. St. Catherine's College, Oxford; Princeton University.

celski, Elizabeth—Energy and Rural Women's Work: Crisis, Response and Policy Alternatives

In many developing countries, rural women are shouldering the major burden of environ-

mental degradation and economic distress, including energy shortages. Fuel for cooking and heating, wild foods, fodder, and biomass raw materials for small industry are becoming increasingly scarce, with serious repercussions on family nutrition, health, and income. Neither energy policies nor rural-development policies have so far come to grips with the links between rural women's work, energy, and the environment. Yet energy could potentially be an effective starting point for addressing women's priority food and income needs. If rural-development and energy policy goals are combined in a participatory approach to working with rural women, both objectives can be better met. *Int. Lab. Rev.*, Jan.-Feb. 1987, 126(1), pp. 41-64. International Labour Office, Geneva.

Köves, András—Some Questions of Energy Policy in East European Countries: Energy Supply and Foreign Economic Policy

The smaller European socialist countries have failed to adjust their economic policy priorities and their energy policy to the radical changes in the international environment. Instead of reducing per unit energy consumption, they tried to maximize primary energy and raw material imports. These efforts were related to the possibilities and interests of the U.S.S.R. as exporter, and to the concept of CMEA cooperation, which considers its basic task to satisfy the mostly physically determined demands of member countries from intra-CMEA sources to the greatest possible extent. *Acta Oecon.*, 1985, 35(3-4), pp. 345-57. Institute for Economic and Market Research, Budapest.

Vlachou, Andriana and Field, Barry C.—Regional Energy Substitution: Results from a Dynamic Input Demand Model

A dynamic input-demand model is used to study regional differences in substitution and speed-of-adjustment patterns at the two-digit manufacturing level. Results do not indicate strong differences among regions in terms of input-demand elasticities. There is weak evidence for slower adjustment speeds in the Northeast than in other regions. Energy and labor appear to have a different substitutability pattern in the Southeast than in other regions.

There are some clear sectoral differences that persist across regions. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 952-66. Athens School of Economics and Business, Greece; University of Massachusetts.

## 800 Manpower; Labor; Population

### 810 MANPOWER TRAINING AND ALLOCATION; LABOR FORCE AND SUPPLY

#### 811 Manpower Training and Development

**Barnow, Burt S.**—The Impact of CETA Programs on Earnings: A Review of the Literature

This paper reviews and assesses evaluations of the Comprehensive Employment and Training Act programs. Most studies have found: that the programs raised earnings by \$200.00 to \$600.00 annually; that they were more effective for women than men; and that public service employment and on-the-job training were more effective than classroom training and work experience. However, the studies differ significantly in many specific impact findings. The nonexperimental nature of the data required making specific assumptions about how individuals were selected to receive training. Because of these and other data limitations, it was impossible to determine which studies modeled the process correctly. *J. Human Res.*, Spring 1987, 22(2), pp. 157-93. ICF Incorporated.

**Fraker, Thomas and Maynard, Rebecca**—The Adequacy of Comparison Group Designs for Evaluations of Employment-Related Programs

This study investigates empirically the strengths and limitations of experimental versus nonexperimental designs for evaluating employment and training programs. It compares results from an experimental-design study—the National Supported Work Demonstration—with estimated impacts of Supported Work, based on comparison groups constructed from the Current Population Surveys. It finds that researchers cannot rely on nonexperimental designs to estimate the effectiveness of employment programs. Impact estimates tend to be sensitive to the comparison-group construction methodology and to the analytic model used.

Currently, no way exists *a priori* to ensure the validity of comparison-group studies as indicators of program impacts. *J. Human Res.*, Spring 1987, 22(2), pp. 194-227. Mathematica Policy Research Incorporated, Princeton, New Jersey.

**Jimenez, Emmanuel and Kugler, Bernardo**—The Earnings Impact of Training Duration in a Developing Country: An Ordered Probit Selection Model of Colombia's *Servicio Nacional de Aprendizaje* (SENA)

This study estimates the earnings impact of one of the most extensive in-service training programs in the developing world, Colombia's SENA, through a comparison of nongraduates' and graduates' earnings profiles. The possible influence of selection is corrected through the use of an ordered probit model to determine participation in short and long courses. The correction causes a significant decline in SENA's earnings effect. The results are robust with respect to alternative specifications of the selection model. *J. Human Res.*, Spring 1987, 22(2), pp. 228-47. World Bank, Washington, D.C.

#### 813 Labor Force

**Anker, Richard; Khan, M. E. and Gupta, R. B.**—Biases in Measuring the Labour Force. Results of a Methods Test Survey in Uttar Pradesh, India

To obtain statistically valid information on the female labor force, which is often underreported by current data collection techniques, a methods survey of 1,621 households was carried out in India using roughly the same number of male and female interviewers, respondents answering for themselves and respondents answering for another, two types of questionnaires, and four labor force definitions. It was found that the sex of the interviewers and the respondents was not a major source of bias, but that the questionnaire design was very important. General questions of the sort that are used in censuses produced especially poor results. The broader the labor-force definition used, the more specific questions needed to be asked in order to obtain accurate information. *Int. Lab. Rev.*, Mar.-Apr. 1987, 126(2), pp. 151-67. International Labour Office, Geneva; Operations Research Group, Baroda, India; Operations Research Group, Baroda, India.

**Ippolito, Richard A.—Why Federal Workers Don't Quit**

Quit rates in the federal government are abnormally low. Some economists, and the federal government itself, have taken this to mean that federal wages are too high. This paper provides an alternative explanation. It shows that the timing of compensation across a career, as well as its level, affects quit rates. Pensions impose large penalties on workers who quit early. The portion of federal pay in the form of pensions is very high. This feature of the federal-pay structure may explain its abnormally low quit rate. As a general proposition, quit rates are poor indices for judging pay adequacy. *J. Human Res.*, Spring 1987, 22(2), pp. 281-99. Pension Benefit Guaranty Corporation, Washington, D.C.

**820 LABOR MARKETS; PUBLIC POLICY**

**821 Labor Economics**

**Alogoskoufis, George S.—Aggregate Employment and Intertemporal Substitution in the UK**

In this paper the author sets up, estimates, and tests an explicit model of aggregate labor supply based on the intertemporal substitution hypothesis. The model is derived as the optimal decision rule of an infinitely-living household maximizing an intertemporal CES utility function over consumption and leisure. The evidence suggests that for aggregate employee hours the model is rejected, but that for the total number of employees in employment the estimates are broadly consistent with the theory. The assumed constant elasticity of substitution is estimated at around 0.2, and this estimate implies a short-run real wage and real interest rate elasticity of labor supply of the same order. *Econ. J.*, June 1987, 97(386), pp. 403-15. Birkbeck College, London.

**Black, Dan A.—The Social Security System, the Provision of Human Capital, and the Structure of Compensation**

In this paper the author examines the effect of the current social security system on the structure of compensation that a wealth-maximizing worker selects. It is shown that the current method of benefit determination encourages an upward-sloping wage profile and that

the social security system alters the mix of wage and pension payments. In addition, the intra-generational transfers of the social security system alter the level of investment in human capital. As a result, the social security system reduces the disparity of income within the economy. *J. Lab. Econ.*, Apr. 1987, 5(2), pp. 242-54. University of Kentucky.

**Browning, Martin—Co-operatives, Closures, or Wage Cuts: The Choices Facing Workers in an Ailing Firm**

Workers faced with the prospect of the closure of their workplace have a limited range of alternatives. They can accept the closure, they can accept wage cuts, or they can take over the firm and form a cooperative. The author finds that if wages are determined in each period in a spot market, then there are circumstances in which workers prefer the latter option. In particular, he finds that workers in an ailing firm may well prefer the cooperative option to closure of their workplace. *Can. J. Econ.*, Feb. 1987, 20(1), pp. 114-22. McMaster University, Canada.

**Carruth, Alan A. and Oswald, Andrew J.—On Union Preferences and Labour Market Models: Insiders and Outsiders**

This paper constructs a model of trade-union behavior in which there is a distinction between "insiders" and "outsiders." This is used to examine one of the most troublesome issues in macroeconomic theory, namely, the extent to which a rise in aggregate demand might generate wage increases rather than growth in employment. A generalization of the most widely used union utility function is presented. The analysis reveals the conditions under which insiders will agree to let outsiders into employment, derives two-step wage preferences, and proves a new result on wage rigidity. *Econ. J.*, June 1987, 97(386), pp. 431-45. University of Kent; London School of Economics.

**Heckman, James and Scheinkman, Jose—The Importance of Bundling in a Gorman-Lancaster Model of Earnings**

This paper considers a multisector Gorman-Lancaster linear characteristics model of earnings in which workers cannot unbundle their

skills. Conditions are presented under which characteristics are uniformly priced across sectors. Empirical evidence is presented for the U.S. labor market that rejects the hypothesis of uniform pricing of characteristics. *Rev. Econ. Stud.*, Apr. 1987, 54(2), pp. 243-55. University of Chicago.

**Jovanovic, Boyan—Work, Rest, and Search: Unemployment, Turnover, and the Cycle**

This paper presents a model that generates procyclical search, procyclical labor productivity, and countercyclical unemployment broadly consistent with the actual behavior of these time series. Concretely, the model introduces an aggregate shock into the sectoral demand-shift model of the type analyzed by Robert Lucas and Edward Prescott. If aggregate shocks operate multiplicatively and are autocorrelated, the payoff to unemployed search can be procyclical to an extent large enough to offset the productive losses associated with search that also are procyclical. *J. Lab. Econ.*, Apr. 1987, 5(2), pp. 131-48. New York University.

**Kiefer, Nicholas M.—A Proposition and an Example in the Theory of Job Search with Hours Constraints**

This paper considers wage-hours contracts in the context of a job-search model. The response of a risk-averse worker to a wage translation of the offer distribution is examined. A robust example illustrates that some "natural" results need not hold. *J. Lab. Econ.*, Apr. 1987, 5(2), pp. 211-20. Cornell University.

**Menchik, Paul L. and Weisbrod, Burton A.—Volunteer Labor Supply**

The authors model the supply of volunteer labor, which received an explicit wage of zero. Quantitatively important, it constituted over 5 percent of total U.S. labor supplied in 1980. Both consumption and investment models are considered—the former positing volunteering as an ordinary consumer good, while the latter posits it as a means of obtaining work experience. Employing survey data, the authors find statistically significant effects of own price (net wage), cross price (net cost of money contributions), and income on volunteer labor supply. Since they find time and money contributions

to be net complements, reduced tax rates should reduce hours volunteered *ceteris paribus*. *J. Public Econ.*, Mar. 1987, 32(2), pp. 159-83. Michigan State University; University of Wisconsin, Madison.

**Newbery, David M. and Stiglitz, Joseph E.—Wage Rigidity, Implicit Contracts, Unemployment and Economic Efficiency**

Standard implicit contract theory can explain wage rigidity but not unemployment and pays insufficient attention to the general equilibrium aspects and constraints limiting the set of feasible contracts. Implicit contracts must specify an enforcement mechanism, can only be conditional on observable information, and must be of limited complexity. Without these restrictions contracts generate full employment which is constrained inefficient. Natural restrictions on enforceability or complexity alone do not produce unemployment, though limited observability may. With two or more restrictions unemployment may result. Specifically, periodic unemployment can arise if contracts are of limited complexity and cannot be enforced through third parties. *Econ. J.*, June 1987, 97(386), pp. 416-30. Churchill College, Cambridge; Princeton University.

**Ohashi, Isao—Cyclical Variations in Wage Differentials and Unemployment**

This paper attempts to reformulate in a general-equilibrium framework M. W. Reder's model, which explains cyclical variations in wage differentials and their general tendencies to narrow. Specifically, the author focuses on the three aspects of his model: the microeconomic behavior of a firm under imperfect information about labor quality; the mechanism of the economy creating unemployment; and the interaction between wage differentials and unemployment. Its implications for the macroeconomic issues on the characteristics of current unemployment and the question of why aggregate employment fluctuates are also explored. *J. Lab. Econ.*, Apr. 1987, 5(2), pp. 278-300. Nagoya University, Japan.

**Wadhvani, Sushil B.—The Effects of Inflation and Real Wages on Employment**

This paper considers the effects of inflation on employment. The absence of index-linked loans and the possibility that errors are committed in times of inflation, lead to a higher probability of bankruptcy during inflation. If firms care about bankruptcy, this implies a lower level of employment. Empirical results confirming this are presented, and suggest that higher inflation has substantially contributed to the fall in employment in the United Kingdom. The authors also demonstrate that a negative real-wage elasticity is not robust to changes in specification. *Economica*, Feb. 1987, 54(213), pp. 21-40. London School of Economics.

**Wright, Randall and Loberg, Janine—Unemployment Insurance, Taxes, and Unemployment**

Unemployment insurance is financed by a tax on wages below a given ceiling. Daniel S. Hamermesh (1977) advocates raising this ceiling on distributional grounds. In a job-search model, this does decrease unemployment among low-wage workers, but also increases unemployment among high-wage workers, and lowers everyone's expected after-tax wage. An increase in the ceiling, combined with a proportionate reduction in the tax rate, decreases unemployment for low-wage workers while increasing their after-tax wage, without affecting high-wage workers at all. When unemployment benefits and wages are taxed at one rate, employment and wages are independent of that rate. *Can. J. Econ.*, Feb. 1987, 20(1), pp. 36-54. Cornell University; Northwestern University.

**822 Public Policy; Role of Government**

**Kahn, Shulamit—Occupational Safety and Worker Preferences: Is There a Marginal Worker?**

Occupational safety levels in nonunion firms are empirically shown to reflect only the preferences of workers with zero to three years job tenure. Therefore, *ex post*, the market is inefficient even if workers were optimizing at the time of hire since there are trades possible among workers that would make all workers better off. The workers who are ignored in the safety-setting process, those workers with more than three years job tenure, prefer less, not

more, safety. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 262-68. University of California, Irvine.

**Petit, Pascal—Full-employment Policies in Stagnation: France in the 1980's**

This paper sets out to ask what happened between 1981 and 1986 to the French policy of full employment. The cautious path followed led to the combination of long-term industrial restructuring with comprehensive monitoring of the labor market. Problems arose on both sides. Short-term policies on the labor market induced structural changes in patterns of work and participation. The goals of industrial restructuring seemed too remote from current problems of unemployment to get clear understanding and backing. This confirmed the idea that economic policies had become ineffective and thus reduced the scope for the further pursuit of comprehensive industrial policies. *Cambridge J. Econ.*, Dec. 1986, 10(4), pp. 393-406. CEPREMAP, Paris.

**Viscusi, W. Kip and Moore, Michael J.—Worker's Compensation: Wage Effects, Benefit Inadequacies, and the Value of Health Losses**

Using the 1977 Quality of Employment Survey in conjunction with BLS risk series and state workers' compensation benefit formulas, the authors assess the labor market implications of workers' compensation. Higher levels of workers' compensation benefits reduce wage levels, and controlling for workers' compensation raises estimates of compensating differentials for risk. The rate of trade-off between wages and workers' compensation suggests that benefit levels provide suboptimal levels of income insurance, abstracting from moral hazard considerations. The value of nonmonetary losses from job injuries (including pain and suffering and nonwork disability), is estimated to be \$17,000 to \$26,000. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 249-61. Northwestern University; Duke University.

**823 Labor Mobility; National and International Migration**

**Falaris, Evangelos M.—A Nested Logit Migration Model with Selectivity**

The author specifies a multiple discrete-choice migration model with a correction for selectivity in wage equations, and applies a less restrictive technique for modeling multiple discrete choices than in previous studies of migration. The author estimates the model using Venezuelan microdata, and finds evidence of positive selection in some state wage equations. This suggests that migration decisions are made according to the principle of comparative advantage. Evidence is also found of unobserved similarities between some states of Venezuela such that individuals regard them as neither perfectly distinct nor perfect substitutes. *Int. Econ. Rev.*, June 1987, 28(2), pp. 429-43. University of Delaware.

**Hughes, Gordon A. and McCormick, Barry—**Housing Markets, Unemployment and Labour Market Flexibility in the UK

This paper examines regional migration and house movement for job-related reasons. The results indicate that public housing inhibits local movement for job-related reasons as well as migration. British migration rates are less than one-half of comparable American rates, even after adjusting for the impact of differences in tenure and college education patterns. There is little evidence that migration operates to reduce interregional differences in rates of unemployment. *Europ. Econ. Rev.*, Apr. 1987, 31(3), pp. 615-41. University of Edinburgh; University of Southampton and Cornell University.

**de Vletter, Fion—**Foreign Labour on the South African Gold Mines: New Insights on an Old Problem

The South African Government has warned that, if sanctions are imposed, it will end the recruitment of workers from its neighbors, with disastrous consequences for their economies. How real is this threat? An analysis of new labor-force data from the largest South African mining group brings out the gold mines' current heavy dependence on skilled foreign workers. But the mines' changing recruitment policy suggests that in future foreign workers will be increasingly phased out of the industry in favor of a more stable domestic labor force. *Int. Lab. Rev.*, Mar.-Apr. 1987, 126(2), pp. 199-218. International Labour Office, Geneva.

**884 Labor Market Studies, Wages, Employment**  
**Bell, Donald and Marclay, William—**Trends in Retirement Eligibility and Pension Benefits, 1974-83

Reduced age requirements for retirement and improved pension payments emerged as major changes between 1974 and 1983 in a sample of pension plans analyzed by the Bureau of Labor Statistics. A group of 187 pension plans either fully or partially paid for by employers was studied. The plans were all those common to a 1974 BLS survey of pension plans whose provisions were filed with the U.S. Department of Labor under the terms of the Welfare and Pension Plan Disclosure Act of 1958, as amended and the 1983 Employee Benefits Survey of medium and large firms. *Mon. Lab. Rev.*, Apr. 1987, 110(4), pp. 18-25. Bureau of Labor Statistics, Washington, D.C.

**Blau, David M.—**A Time-series Analysis of Self-Employment in the United States

In the early 1970s the proportion of the non-agricultural labor force self-employed in the United States ceased its downward trend and has been rising ever since. This study provides an analysis of the causes of this change. A general-equilibrium model of self-employment and wage employment is analyzed, and aggregate U.S. time-series data are used to test predictions derived from the model. The empirical analysis indicates that changes in technology, industrial structure, tax rates, and social-security retirement benefits have contributed to the reversal of the previous downward trend, which had persisted for over a century. *J. Polit. Econ.*, June 1987, 95(3), pp. 445-67. University of North Carolina.

**Brown, Sharon P.—**How Often Do Workers Receive Advance Notice of Layoffs?

In September 1986, the Bureau of Labor Statistics surveyed establishments in seven States which participated in the Bureau's layoff system—soon to be nationwide. A total of 248 establishments responded, accounting for 271 layoffs and the separation of 67,800 workers, 49,327 of whom filed for unemployment compensation. About 2 out of 3 layoffs occurred in the surveyed States without workers receiving advance general notice. When advance general

notice was provided, workers were usually given an average 46 days notice. In slightly more than half of the layoffs, establishments provided specific notice of more than 1 day to employees, averaging 18 days of notice. *Mon. Lab. Rev.*, June 1987, 110(6), pp. 13-17. Bureau of Labor Statistics, Washington, D.C.

**Davis, Douglas D.**—Maximal Quality Selection and Discrimination in Employment

Unlike a sample mean, the expected value of a sample maximum is directly related to the number of observations in the sample. Thus, if employers draw inferences about population quality from the maximal-quality black and white candidates interviewed in a job search, employers may perceive the black population to be inferior to the white population, even when racial ability distributions are identical. This paper uses experimental methods to examine the effects of maximal-quality selection on decision makers' population quality perceptions. Experimental results suggest that maximal-quality selection creates a misperception of minority inferiority, particularly when decision makers are forced to maintain a record of maximal observations from minority and majority groups, and that maximal-quality selection perpetuates quality misperceptions even when the minority population is in fact of superior average quality. *J. Econ. Behav. Organ.*, Mar. 1987, 8(1), pp. 97-112. Federal Trade Commission, Washington, D.C.

**Falus-Szikra, Katalin**—Wage and Income Disparities between the First and Second Economies in Hungary

There is a dual wage and income level in Hungary: wages in the sector of large enterprises are significantly lower than in the private sector and, generally, in the scope of small ventures. The main cause of this large income disparity is the shortage present in the whole economy and the deriving weakness of competition. The disparity can and should be eliminated by raising the wage level in the state sector and by moderating excessively high incomes in the second economy which are not proportionate to performance. *Acta Oecon.*, 1986, 36(1-2), pp. 91-103. Karl Marx University of Economics, Budapest, Hungary.

**Gordon, Robert J.**—Productivity, Wages, and Prices inside and outside of Manufacturing in the U.S., Japan, and Europe

This paper studies changes in productivity, wages, and prices, based on a new data set for the aggregate economy, the manufacturing sector, and the nonmanufacturing sector. Results are presented for the United States, Japan, and a European aggregate consisting of eleven European economies. Differences between Europe and the United States have been exaggerated in recent work. Europe has neither greater nominal-wage flexibility nor more rigid real wages than the United States. Evidence that the United States exhibits more nominal rigidity is confined to manufacturing. These results undermine the argument that, because the European aggregate supply curve is uniquely vertical, demand expansion in Europe is inopportune. *Europ. Econ. Rev.*, Apr. 1987, 31(3), pp. 685-733. Northwestern University and National Bureau of Economic Research.

**Horvath, Francis W.**—The Pulse of Economic Change: Displaced Workers of 1981-85

This article includes principal findings of a special supplement to the Current Population Survey sponsored by the Employment and Training Administration. The survey's supplement, almost identical to a study conducted in January 1984, was designed to answer some of the questions about "displaced workers." Altogether, a total of 10.8 million workers 20 years of age and over answered that they had lost a job because of plant closings, employers going out of business, or layoffs. The survey focuses on those displaced workers who had spent 3 years or more of tenure on the jobs they lost, some 5.1 million. *Mon. Lab. Rev.*, June 1987, 110(6), pp. 3-12. Bureau of Labor Statistics, Washington, D.C.

**Kraft, Kornelius**—Exit and Voice in the Labor Market: An Empirical Study of Quits

The topic of this article is the study of quit rates experienced by medium-sized German firms of the metal industry. The hypothesis of the exit-voice tradeoff in the labor market is investigated by explicitly taking into account the decision rights of workers. It can be shown that decision rights have a significant negative

effect on quits, but no feedback relation can be found. Furthermore, the effects of human-capital investment and working conditions on turnover are analyzed. *J. Inst. Theoretical Econ.*, Dec. 1986, 142(4), pp. 697-715. Gesamthochschule Kassel, West Germany.

**Miller, Paul W.**—Gender Differences in Observed and Offered Wages in Canada, 1980

According to the 1981 Census of Canada, the female rate of pay is 30 percent less than the male rate. The average female wage offer, however, is only around one-half of that received by males, other things being equal. Slightly more than one-half of the difference in observed wages can be explained by differences in wage-related characteristics between males and females. Two-fifths of the disparity between wage offers can be explained by the same set of factors. Analysis of the distribution of wage offers indicates greater wage inequality in the Canadian labor market than suggested by study of observed wages. *Can. J. Econ.*, May 1987, 20(2), pp. 225-44. Brunel University, Uxbridge, United Kingdom and Australian National University, Canberra.

**Nakosteen, Robert A. and Zimmer, Michael A.**—Marital Status and Earnings of Young Men: A Model with Endogenous Selection

It is a matter of course in applied labor economics to presume that marital status is a predetermined contributor to earnings among young males. The authors find no evidence to support that proposition. They estimate a model of earnings determination that permits endogenous selection of marital status. Estimates are based on a sample of young employed males from the Michigan panel Survey of Income Dynamics, and indicate that marital status, viewed in this manner, does not significantly shift the mean earnings profile. Sensitivity tests indicate that the conclusion is robust with respect to a variety of alternative specifications. *J. Human Res.*, Spring 1987, 22(2), pp. 248-68. University of Massachusetts; University of Evansville.

**Perloff, Jeffrey M. and Sickles, Robin C.**—Union Wage, Hours, and Earnings Differentials in the Construction Industry

Full-information maximum likelihood is used to estimate union wage, hours, and earnings markups. Construction union wage markups are positive (58.2 percent at the sample means). Since union hours markups are negative (-4.0 percent) for most demographic groups, union earnings markups (51.1 percent) are smaller than the wage markups. All exogenous variables are allowed to interact with the endogenous union dummy variable, which allows us to test whether markups vary across demographic groups, whether increased local unionization has a positive spillover effect in the nonunion sector, and whether increased local unemployment equally affects wages and hours in the two sectors. *J. Lab. Econ.*, Apr. 1987, 5(2), pp. 174-210. University of California, Berkeley; Rice University.

**Polachek, Solomon W. and Yoon, Bong Joon**—A Two-Tiered Earnings Frontier Estimation of Employer and Employee Information in the Labor Market

This paper develops a "two-tiered frontier" estimation procedure to decompose the residual of an earnings function into three components. The first component can be interpreted as being purely random. Search theory is used to show that the other two components represent employee and employer ignorance of offer and reservation wages respectively. Relative employee and employer ignorance estimates are presented for various population strata. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 296-302. State University of New York at Binghamton.

**Riechel, Klaus-Walter**—Labor Market Disequilibrium and the Scope for Work-Sharing: A Case Study of the Netherlands

This paper assesses the preconditions and scope for work sharing—an arrangement combining higher employment with shorter working hours—by examining disequilibrium in the Dutch labor market. Although workers' labor-supply functions, wage restraint, and official labor-market policies seem to favor work sharing, employers' preferences seem to counter the arrangement. To examine firms' employment preferences and their causes, the paper develops a small model to estimate the effect on labor

demand of the desired split of labor inputs between employment and working hours. Results suggest strong impediments to work sharing in the Netherlands. *Int. Monet. Fund Staff Pap.*, Sept. 1986, 33(3), pp. 509-40. International Monetary Fund, Washington, D.C.

**Tachibanaki, Toshiaki**—Labour Market Flexibility in Japan in Comparison with Europe and the U.S.

This paper examines aspects of labor market flexibility in Japan, Europe and the United States, emphasizing Japan. It investigates the importance of labor supply, mobility, adjustment costs, the flexibility of wages, and the seriousness of unemployment. Various reasons are given why the rate of unemployment in Japan is a poor indicator of labor-market conditions. While Japan has flexibility in some areas, rigidity is also observed in other areas. It is concluded that flexibility does not contribute to an improved performance of the Japanese labor market, and that achieving flexibility has significant costs. Labor-market flexibility should not be introduced in other countries prior to a careful examination of the costs and benefits. *Europ. Econ. Rev.*, Apr. 1987, 31(3), pp. 647-78. Kyoto University, Japan.

**Yamada, Tadashi and Yamada, Tetsuji**—Part-time Work of Married Women in Urban Japan

There has been a great increase in the part-time employment of married women in Japan in recent years. The authors apply a logit model of the part-time labor force participation of married women to the 1980 Population Census data of Japan. The wage elasticity of the part-time labor force participation of married women is significantly positive and larger than the elasticity of their full-time counterparts. An increase in the husband's income discourages the incentive for married women to work part time, while the married women working part time are extremely vulnerable to the business cycle. *Quart. Rev. Econ. Bus.*, Spring 1987, 27(1), pp. 41-50. National Bureau of Economic Research, and Graduate School and University Center of City University of New York; Graduate School and University Center of City University of New York.

**826 Labor Markets: Demographic Characteristics**  
**Even, William E.**—Career Interruptions Following Childbirth

The aggregate probability of ending a career interruption that begins at childbirth is shown to diminish rapidly with the length of the interruption. The empirical models estimated suggest that the decline can be explained by a combination of structural duration dependence, unobserved heterogeneity, and differences in observed characteristics. The probability of returning to employment for a group of women with identical observed characteristics is found to have an L-shaped distribution for the majority of the sample, suggesting that many women have a very low probability of returning. *J. Lab. Econ.*, Apr. 1987, 5(2), pp. 255-77. Miami University, Oxford, Ohio.

**830 TRADE UNIONS; COLLECTIVE BARGAINING;  
LABOR-MANAGEMENT RELATIONS**

**831 Trade Unions**

**Beladi, Hamid and Brunner, Lawrence P.**—Trade Unions and Money Wage Changes in U.S. Manufacturing Industries: Further Empirical Evidence

This paper performs Granger causality tests on quarterly union-scale wage changes and average hourly earnings in U.S. manufacturing from 1958 to 1978. It is shown that average hourly earnings have feedback effects on union-scale wages and vice versa. Average hourly earnings changes cause union-scale wage changes and vice versa. A unidirectional view of causation (from union-scale wages to earnings), therefore, is flawed. Policy makers are not justified in focusing only on major union contracts when implementing income policies. Also, analysis of industry hourly earnings should use structural wage equations that could capture the interactions between simultaneously determined variables such as hourly earnings and union-scale wages. *Quart. J. Bus. Econ.*, Summer 1987, 26(3), pp. 79-86. Central Michigan University.

**Faith, Roger L. and Reid, Joseph D., Jr.**—An Agency Theory of Unionism

An agency theory of unionism is developed to explain the diversity of union accomplishments by the diversity of principals, the diver-

sity of costs of providing union benefits, and the potential for agent malfeasance. The theory produces a number of testable hypotheses, including: larger plants will unionize before smaller plants; the scope of union representation will grow as members go from untrained to specifically trained to generally trained; employers will pay for union representation of unskilled employees, but not for others; and the slope of earnings with respect to seniority will be flatter in union firms than in nonunion firms. *J. Econ. Behav. Organ.*, Mar. 1987, 8(1), pp. 39-60. Arizona State University; George Mason University.

### 832 Collective Bargaining

Lacombe, John and Borum, Joan—Major Labor Contracts in 1986 Provided Record Low Wage Adjustments

In 1986, major collective-bargaining settlements in private industry provided record-low wage and compensation adjustments, reflecting both employers' and unions' efforts to curb labor costs. Their task was made easier by continued moderate upward pressures on wages from comparatively small increases in consumer prices. According to the Bureau of Labor Statistics' nineteen-year-old series on private industry agreements covering 1,000 workers or more, wage adjustments—the net effect of decisions to increase, decrease, or not change wages—under settlements reached during 1986 averaged 1.2 percent in the first contract year and 1.8 percent annually over the contract term. *Mon. Lab. Rev.*, May 1987, 110(5), pp. 10-16. Bureau of Labor Statistics, Washington, D.C.

Schnell, John F. and Grant, Cynthia L.—Learning by Striking: Estimates of the Teetotaler Effect

The authors hypothesize that past strike experience will have a negative or "teetotaler" effect on a collective bargaining unit's propensity to strike in future negotiations, other things being equal. They test this using a unique micro-level sample comprising four consecutive negotiations by 147 bargaining units in U.S. manufacturing industries, controlling for observable and unobservable differences among bargaining pairs in the propensity to strike. The

results are consistent with the view experience of striking is, indeed, lagged strike experience variables have a significantly negative effect on the propensity to strike in the current negotiation. *J. Lab. E.* 1987, 5(2), pp. 221-41. Syracuse University; Cornell University.

Tracy, Joseph S.—An Empirical Test of an Asymmetric Information Model of

Recent developments in the theory of strategic bargaining demonstrate how information asymmetries can lead to prolonged strikes. These models can be applied to actual negotiations, yielding an economic theory of strikes. To date, few empirical tests of these models have been carried out. In this paper, a set of predictions concerning the relationship between the duration of strikes and unconditional duration of strikes is derived from a simple bargaining model in which the union is uncertain about the firm's future profitability. These predictions are then tested using a micro data set of major U.S. contract negotiations that took place from 1973-77. *Econ. Apr.* 1987, 5(2), pp. 149-73. Yale University.

### 850 HUMAN CAPITAL; VALUE OF HUMAN CAPITAL

851 Human Capital; Value of Human Capital  
Armitage, Jane and Sabot, Richard—Human Capital Background and the Return to Schooling in Two Low-income Economies

In the United Kingdom, the income yielded by an additional year of schooling declines as the occupational status of the worker's father rises. In this note the relationship between family background and returns to schooling is measured in Kenya and Tanzania. In contrast to the United Kingdom, a positive relationship is documented between family background and returns to schooling in these two low-income economies. Explanations for this marked difference between a high-income economy and two low-income economies are suggested. *Economia Africana* 1987, 34(213), pp. 103-08. World Bank, Washington, D.C. and Williams College, Williamstown, Mass.

Feuer, M.; Glick, H. and Desai, A.—Sponsored Education Viable?

This paper challenges the common human-capital assumption that profit-maximizing

firms cannot invest in their employees' general training. The authors argue that general training is provided to equilibrate a hostage-type relationship that exists when firms and workers share investments in specific training, and that the firm's investment in general training is not necessarily subject to poaching hazards. The authors then test the viability hypothesis empirically, using data from a longitudinal survey of natural and social scientists and engineers. Our results suggest that: (1) firm investments in general training programs are not necessarily paid for by foregone earnings; and (2) turnover rates do not rise as a function of firm-sponsored general training. These results are discussed in terms of the current policy debate over corporate education expenditures. *J. Econ. Behav. Organ.* Mar. 1987, 8(1), pp. 121-44. Drexel University; University of Pennsylvania; Ohio State University.

**Johnson, William R.—Income Redistribution as Human Capital Insurance**

This paper considers whether extant empirical evidence is consistent with the view of income redistribution as human capital insurance. If parents can invest in their children with schooling and bequests, but the returns to schooling are risky because diversification is limited, then risk-averse parents may choose redistribution. Under certain conditions, the desired amount of income redistribution rises with the return to human capital. Cross-country comparisons show a positive relation between industrial activity and income redistribution. This is consistent with the theory if the return to human capital investment is raised by industrialization. Other interpretations may explain this finding. *J. Human Res.*, Spring 1987, 22(2), pp. 269-80. University of Virginia.

**900 Welfare Programs; Consumer Economics; Urban and Regional Economics**

**910 WELFARE, HEALTH, AND EDUCATION**

**Gács, Endre—Hungary's Social Expenditures in International Comparison**

The relative level of social expenditure in Hungary is not high as compared either to the average or to the countries standing close to

her geographically or in development level. The level and share of health expenditures is strikingly low in the country. The real increase of expenditures in Hungary was somewhat above the average of the developed countries during the 1960s and 1970s while the increase of the old-age pension fund was extremely fast. The factors of increase in individual periods are similar to those of the majority of the OECD countries. *Acta Oecon.*, 1986, 36(1-2), pp. 141-54. National Planning Office, Budapest, Hungary.

**911 General Welfare Programs**

**O'Neill, June A.; Bassi, Laurie J. and Wolf, Douglas A.—The Duration of Welfare Spells**

Probability distributions for the duration of welfare spells are estimated. The principle guiding the work is that a recipient will not exit from welfare if the expected utility on welfare exceeds the expected utility off welfare. The analysis indicates that while the majority of welfare spells are of short duration, a nontrivial minority of spells are quite long. Those recipients with long spells are found to differ in predictable ways from those experiencing brief spells. This suggests that strategies to move women off welfare are unnecessary in many cases, and should be targeted on those most likely to be long-term recipients. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 241-48. U.S. Commission on Civil Rights, Washington, D.C.; Georgetown University; International Institute for Applied Studies, Vienna.

**Ranney, Christine K. and Kushman, John E.—Cash Equivalence, Welfare Stigma, and Food Stamps**

This study explores the cash equivalence of food stamps and program-participation-related welfare stigma. The authors clarify important distinctions between cash equivalence in utility and in food demand within the context of the program, and between the program and an alternative cash transfer program. The analysis of program participation suggests that stamps are: nearly cash equivalent in the market goods component of utility; not cash equivalent in the nonmarket components due to welfare stigma; and not cash equivalent in food demand. Stamps increase expenditures on food more

than cash by a factor of six to one. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 1011-27. Cornell University; University of California, Davis.

### 912 Economics of Education

Arcelus, F. J. and Levine, A. L.—Merit Goods and Public Choice: The Case of Higher Education

This paper examines the supply and demand behavior of taxpayers as "suppliers" and students as "beneficiaries" of the higher-education process. The authors treat higher education as a merit good, and present an argument in favor of an assumption of nonreciprocal interdependence between the taxpayers and the beneficiaries. They conclude that there is no evidence to support the proposition that subsidies-in-kind, in the form of attendance at and only at a state institution, have had a retardative effect on the aggregate production/consumption of higher education. *Public Finance*, Dec. 1986, 41(3), pp. 303-15. University of New Brunswick.

Throsby, C. D.—Cost Functions for Australian Universities

This paper reports some new cost functions for the Australian university sector, estimated using pooled data at the interinstitution level and cross-section data at the interfaculty level. The results shed some light on scale relationships between and within universities in Australia, and enable some quantification of the cost differences between the arts, natural science, and professional-scientific subject areas. After allowance is made for resources devoted to research, teaching-only recurrent costs are derived which form a basis for a broad evaluation of alternative tuition-fee proposals for Australian universities at the present time. *Australian Econ. Pap.*, Dec. 1986, 25(47), pp. 175-92. Macquarie University, Australia.

### 913 Economics of Health (including medical subsidy programs)

Berger, Mark C., et al.—Valuing Changes in Health Risk: A Comparison of Alternative Measures

Willingness-to-pay measures for human health risk reduction are compared with alter-

native measures using a model which incorporates uncertainty, endogenous health, mortality, and morbidity. It is shown that expected private costs of illness and preventive expenditures are not special cases of willingness to pay. However, for pure morbidity, under plausible conditions these alternative measures are lower bounds on willingness to pay. Results from a contingent valuation survey for the avoidance of seven light symptoms show that deterministic consumer surplus exceeds actual private costs of illness and imply that willingness to pay is greater than expected private costs of illness. Coauthors are Glenn C. Blomquist, Don Kenkel, and George S. Tolley. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 967-84, University of Kentucky.

Coyte, Peter C.—Alternative Methods of Reimbursing Hospitals, and the Impact of Certificate-of-Need and Rate Regulation for the Hospital Sector

This paper employs the technique of equalizing differences to provide a conceptual framework which is directly amenable to an analysis of an array of hospital regulatory programs. In this analysis, state certificate-of-need laws and the program of rate regulation are shown to affect not only the equilibrium bundle of services but also various accounting measures of hospital costs and the demand for factor inputs. The main conclusion of this study is that both the method of prospective reimbursement for hospitals and the existing regulatory environment jointly determine the endogenous variables. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 858-73. University of Alberta.

Cromwell, Jerry and Mitchell, Janet B.—Physician-Induced Demand for Surgery

This paper provides several tests of neoclassical and inducement theories of surgical demand. A simultaneous equation model is used to estimate physician demand and equilibrium fees for surgery from a sample of 350 Primary Sampling Units over the 1969-76 period. The results support the notion of competitive market failure—particularly in large metropolitan areas. Other things equal, fees and utilization are higher in surgeon-rich areas although the estimated shift elasticities were only about one-

third of those found by Victor R. Fuchs (1978). A statistically significant, albeit small, price elasticity of demand for surgery was also obtained, in contrast to Fuchs. *J. Health Econ.*, Dec. 1986, 5(4), pp. 293-313. Center for Health Economics Research, Needham, Massachusetts.

**Farley, Pamela J.**—Theories of the Price and Quantity of Physician Services: A Synthesis and Critique

The difficulty in applying the neoclassical model of supply and demand to physician services is the rationing of resources directly by physicians, eliminating the allocative function of prices. Welfare consequences are appropriately judged in terms of efficiency and equity, not departures from the structural relationships implied by supply and demand. As interpreted here, both competitive theories and target-income theories imply that physicians consider both their own welfare and their patients' welfare in their pricing and prescribing decisions. The distribution between patients and physicians of the resulting social gains is determined by professional ethics within bounds imposed by competitive forces. *J. Health Econ.*, Dec. 1986, 5(4), pp. 315-33. National Center for Health Services Research, Rockville, Maryland.

**Register, Charles A. and Bruning, Edward R.**—Profit Incentives and Technical Efficiency in the Production of Hospital Care

Based on a combination of linear programming and regression techniques, it was determined that significant technical efficiency differences did not exist between for-profit and nonprofit hospitals in a nationwide sample of 457 hospitals. The sample included 300 nonprofit, 121 for-profit, and 36 government hospitals during 1983. The method employed was to determine an efficiency index for each hospital using linear programming and then to use this index as a dependent variable in a regression designed to explain existing differences in efficiency. Given sample matching, the result should not be extended to the population without care. *Southern Econ. J.*, Apr. 1987, 53(4), pp. 899-914. Kent State University.

**914 Economics of Poverty**

**Kanbur, S. M. Ravi**—Measurement and Alleviation of Poverty: With an Application to the Effects of Macroeconomic Adjustment

This paper reviews the measurement of poverty, analyzes alternative strategies for poverty alleviation, and suggests a methodology for evaluating the impact of macroeconomic adjustment on poverty. The paper begins with the conceptual basis of alternative poverty lines and indices, then introduces "crossover time," the time taken for an average poor person to cross the poverty line if his income grew at the national per capita income growth rate. The paper discusses targeting public expenditure on the poor, analyzes macroeconomic adjustment and poverty, and derives rules for when expenditure reduction or expenditure switching will increase or decrease poverty. *Int. Monet. Fund Staff Pap.*, Mar. 1987, 34(1), pp. 60-85. University of Warwick and Princeton University.

**915 Social Security**

**Feldstein, Martin S.**—Should Social Security Benefits Be Means Tested?

Social-security retirement benefits distort the saving decisions of workers who are rational enough to save for their future. Since the implicit rate of return in an unfunded social-security program is less than the marginal product of capital, the resulting decline in saving causes a welfare loss. The present paper examines the conditions under which the welfare loss can be reduced by replacing the current universal social-security program with a means-tested program that pays benefits only to those individuals with little or no other retirement income or assets. *J. Polit. Econ.*, June 1987, 95(3), pp. 468-84. Harvard University and National Bureau of Economic Research.

**Greenblum, Joseph and Bye, Barry**—Work Values of Disabled Beneficiaries

This article compares data on a particular concept of work values, the importance to the self of having a job, for social security disability insurance beneficiaries, other disabled persons, and nondisabled persons. Descriptive comparisons of these three groups with similar demographic characteristics indicates that belief in the importance of a job does not decline after

entitlement to disability insurance benefits. The findings support current efforts to promote re-employment through work-incentive and vocational-rehabilitation policies. *Soc. Sec. Bull.*, Apr. 1987, 50(4), pp. 67-74. Social Security Administration, Washington, D.C.

**917 Economics of Minorities; Economics of Discrimination**

**Tzannatos, Zafiris—A General Equilibrium Model of Discrimination and Its Effects on Incomes**

A general-equilibrium model is utilized to examine the effects upon factor incomes of the narrowing of an arbitrary wage differential between two groups of workers. The empirical section draws upon the recent experience of female workers in Britain after the introduction of the Equal Pay Act. The results suggest that profits are more likely to decrease when arbitrary wage differentials narrow, and this conclusion casts doubt whether many of the neoclassical theories of discrimination are relevant to the empirical study of discrimination. *Scott. J. Polit. Econ.*, Feb. 1987, 34(1), pp. 19-36. University of Buckingham.

**920 CONSUMER ECONOMICS**

**921 Consumer Economics; Levels and Standards of Living**

**Behrman, Jere R. and Deolalikar, Anil B.—Will Developing Country Nutrition Improve with Income? A Case Study for Rural South India**

The World Bank and others maintain that the major mechanism for improving nutrition in poor communities is increases in income. Aggregate estimates of food expenditure are consistent with such a possibility, implying income/expenditure elasticities close to one. However, the high degree of aggregation at which such estimates are made means that the considerable increase in price per nutrient as income increases is ignored, and the nutrient elasticities are therefore overstated. Estimates for a rural south Indian sample indicate that this bias is considerable and that the true nutrient elasticities with respect to income may be close to zero. *J. Polit. Econ.*, June 1987, 95(3), pp. 492-507. University of Pennsylvania.

**Cox, Donald—Motives for Private Income Transfers**

Private income transfers are becoming increasingly recognized as a key aspect of the U.S. economy. The majority of private income transfers occur *inter vivos* (i.e., between living persons), but very little is known about this type of transfer behavior. This paper tests alternative hypotheses concerning motivation for *inter vivos* transfers. Two motives are considered: altruism and exchange. Evidence presented here casts doubt on the altruistic model of transfer behavior. Observed patterns for *inter vivos* transfers are more consistent with exchange-related motives. This finding has important implications for the effects of public transfer programs on the distribution of economic well-being. *J. Polit. Econ.*, June 1987, 95(3), pp. 508-46. Washington University.

**Gupta, Kanhaya L.—Aggregate Savings, Financial Intermediation, and Interest Rate**

There has been considerable controversy about the role of financial factors as determinants of savings in developing countries. This paper explores the importance of two such factors, namely, real interest rate and financial intermediation. Using pooled time-series, cross-section data, a model of savings is estimated for Asia, Latin America, and for the total sample. Particular attention is paid to the error structure in estimation. The results suggest that pooling is not justified. Further, there is no unequivocal support for the effect of either of the two factors; some qualified support is found for Asia but none for Latin America. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 303-11. University of Alberta.

**Hill, Daniel H.—Derived Demand Estimation with Survey Experiments: Commercial Electric Vehicles**

In this paper the author examines the demand for a hypothetical input, electric over-the-road vehicles, in the commercial sector using data from a survey experiment. This experiment is designed to allow the estimation of theoretically-plausible, derived-demand functions from either the Translog or the CES production functions. A heteroscedasticity-corrected, two-limit Tobit model is developed and estimated. The results provide evidence of con-

siderable adaptability to new technologies and price structures on the part of firms. They evidently would be willing to cope with the limited traveling range of electric vehicles if these vehicles were able to provide a less costly means of doing business. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 277-85. Institute for Social Research, University of Michigan.

**Kovács, Ilona**—International Comparison of Consumption Patterns by Cluster Analysis

This study compares the structures of private personal consumption in seventeen OECD countries on different levels of economic development and in Hungary with the aid of cluster analysis in the years between 1965-81. The ranking of countries by similarities in their consumption levels shows a close interrelation with their ranking by economic development level, but the influence of relative prices is also important. Hungary forms a cluster of her own, and consumption in this country is characterized by: a relatively high share of food; an exceptionally high share of alcoholic beverages; and a low share of housing and health expenditures. *Acta Oecon.*, 1985, 35(3-4), pp. 313-26. Institute of Economics, Hungarian Academy of Sciences, Budapest.

**Warshawsky, Mark J.**—Sensitivity to Market Incentives: The Case of Policy Loans

The standard neoclassical theory is rejected as an explanation for the observed reluctance of most holders of whole life insurance to borrow against the cash value of their policies at favorable rates of interest. Even when the neoclassical theory is augmented with transactions costs and short awareness lags, several empirical tests using survey and time-series data reject the standard theory in favor of an explanation invoking self-imposed rules against borrowing or the "debt ethic." This evidence lends support to the psychology-based theories of Thaler and Shefrin (1981). *Rev. Econ. Statist.*, May 1987, 69(2), pp. 286-95. Board of Governors of the Federal Reserve System, Washington, D.C.

**930 URBAN ECONOMICS**

**932 Housing Economics**

**Blackley, Dixie M. and Fellain, James R.**—Tests of Locational Equilibrium in the Standard Urban Model

The primary purpose of this paper is to examine the empirical validity of the locational equilibrium condition associated with the standard urban economics model. Household data from the Annual Housing Survey are the basis for all of the empirical analysis. The results indicate the locational equilibrium condition is generally not satisfied; this is especially true for owners. In particular, households appear to commute much longer distances than those predicted by the locational equilibrium condition. Also, the results indicate that OLS estimates of a housing demand equation and a location equation may be biased. Non-linear least squares estimates that incorporate the simultaneity between housing demand and locational equilibrium are offered as an alternative. *Land Econ.*, Feb. 1987, 63(1), pp. 46-61. LeMoyne College; University of Illinois.

**940 REGIONAL ECONOMICS**

**941 Regional Economics**

**Beeson, Patricia**—Total Factor Productivity Growth and Agglomeration Economies in Manufacturing, 1959-73

This paper investigates the determinants of productivity growth in the manufacturing sector of states over the period 1959-73. Special emphasis is placed on isolating the effects of a state's urbanization characteristics on productivity growth. Urbanization characteristics considered include the spatial arrangement of cities along with the standard measures of urbanization. The results indicate that while both scale economies and technical change are related to urbanization characteristics, the effects tend to be offsetting; no relationship is found between urbanization and overall productivity growth as measured by total factor productivity growth. *J. Reg. Sci.*, May 1987, 27(2), pp. 183-99. University of Pittsburgh.

**Drewes, Torben**—Regional Wage Spillover in Canada

The persistently high unemployment rate of the Atlantic Region of Canada may be a symptom of importation into the region of inappropriately high wage levels from other Canadian regions. A theoretical explanation for the existence of such interregional wage spillover is

offered. The hypothesis of spillover is empirically examined using data on the wage change provisions of individual contracts in the manufacturing sector. Possible econometric problems associated with contract data are examined and corrective measures taken. Results of the estimation support the hypothesis that wage spillover plays a role in the determination of Atlantic Region wages. *Rev. Econ. Statist.*, May 1987, 69(2), pp. 224-31. Trent University, Canada.

**Folmer, Henk and Nijkamp, Peter**—Investment Premiums: Expensive but Hardly Effective

This Paper discusses the effects of the investment premiums arrangement, which is one of the main instruments of regional economic policy in most Western countries. On the basis of theoretical considerations and various Dutch case studies, it is concluded that a basic revision of this policy instrument might lead to a reduction of the costs and an improvement of the effects. The case study presented in this paper applies the LISREL framework which allows the handling of latent and observable variables simultaneously. In this way, effects of policy packages, which are defined as latent variables, can be analyzed. *Kyklos*, 1987, 40(1), pp. 43-72. Agricultural University, Wageningen; Free University, Amsterdam.

**Friesz, Terry L. and Luque, Javier**—Optimal Regional Growth Models: Multiple Objectives, Singular Controls, and Sufficiency Conditions

The authors develop a generalized Harrod-Domar type of model for optimal regional growth which allows determination of the optimal allocation of regional public investments and which considers multiple growth objectives, as well as both normal and singular fiscal instruments. This general model is shown to include most of the previous optimal regional growth models as special cases that verify that singular controls do exist in certain instances, and that they must be considered for the complete specification of optimal regional growth policies. This is significant because singular controls have not been previously analyzed in the literature. *J. Reg. Sci.*, May 1987, 27(2),

pp. 201-24. University of Pennsylvania; University of North Florida.

**Garhart, Robert E. and Giarratani, Frank**—Nonsurvey Input-Output Estimation Techniques: Evidence on the Structure of Errors

This paper concerns the nature and extent of error introduced to regional input-output multipliers by errors associated with the estimation of regional purchase coefficients (RPCs). Using the Washington State input-output model and computer simulations, estimates of multiplier error are generated for two distinct sources of RPC error. The results indicate that multiplier error from both RPC sources may be significant and support the findings of previous studies which highlight the importance of error introduced to the household purchases column for multiplier accuracy. *J. Reg. Sci.*, May 1987, 27(2), pp. 245-53. College of St. Thomas; University of Pittsburgh.

**Harris, Anthony H., et al.**—Incoming Industry and Structural Change: Oil and the Aberdeen Economy

This paper quantifies the employment effects of the oil industry on the local economy of Aberdeen. It estimates not only the regional multiplier effects of the new industry, but also uses a form of shift-share analysis to estimate the supply-side effects on the labor and property markets. It is argued that in addition to creating jobs, the oil sector has also displaced existing jobs in non-oil industries and deterred new firms from entering the area. Quantification of the displacement and deterrence effects suggests that they are not large, but that they are significant in a number of individual industries. Coauthors are Michael G. Lloyd, Alastair J. McGuire, and David A. Newlands. *Scot. J. Polit. Econ.*, Feb. 1987, 34(1), pp. 69-90. University of Aberdeen.

**Jones, Donald W. and Krummel, John R.**—The Location Theory of the Plantation

This paper develops a method for studying noninfinitesimal operational units, with the Thünen location and land use model. With constant returns to scale and perfect divisibility of nonland inputs, all operational units would

only a point on the landscape. The present model uses increasing returns to scale to generate large operational units, called "plantations," and studies the comparative statics. The setting of the model is an agricultural operation in which some processing of raw crop must be conducted prior to shipment to market. The processing is assumed to have increasing returns to scale. *J. Reg. Sci.*, May 1987, 27(2), 157-82. Oak Ridge National Laboratory; Argonne National Laboratory.

**Abler, Jack C.**—Trade Center Evolution in the Great Plains  
Empirical analysis has lagged behind the impressive additions to the theoretical literature

on trade-center systems during the past fifteen years. This study of the trade-center system in Saskatchewan is an attempt to begin to redress the imbalance and to test some of the recently formulated theoretical propositions. Communities are identified according to functional classifications for 1961 and 1981 with the aid of a cluster analysis program, and the validity of the groupings are verified using multiple-discriminant analysis. Changes in the size, spacing, and function of clusters and individual communities during the twenty-year interval are described, and an effort is made to provide explanations for the changes observed. *J. Reg. Sci.*, May 1987, 27(2), pp. 225-44. University of Saskatchewan.

# Doctoral Dissertations in Economics

## Eighty-fourth Annual List

The list below specifies doctoral degrees conferred by American universities and colleges during the year terminating June 1987.

### General Economics; including Economic Theory, History of Thought, Methodology, Economic History and Economic Systems

- ANDREONI, JAMES R., Ph.D. University of Michigan 1986. Essays on Private Giving to Public Goods
- BANERJI, SANJAY, Ph.D. SUNY at Buffalo 1987. Incomplete Information, Adjustment Costs and the New Classical Microeconomics
- BECKER, KLAUS-GUNTER, Ph.D. University of Kansas 1987. Essays on the Sustainability of a Natural Monopoly
- BELCHER, LAWRENCE J., Ph.D. Indiana University 1987. Simple Dynamic Models with Uncertainty
- BERGER, GEORGE SWANK, Ph.D. University of California, Davis 1987. Labor as a Quasi-fixed Factor: A Revision
- BERGIN, JAMES, Ph.D. Princeton University 1986. Repeated Incomplete Information Games with Discounting
- BERNHARDT, MARK DANIEL, Ph.D. Carnegie-Mellon University 1986. Three Essays in Applied Dynamic Microeconomic Theory
- BERTAUX, NANCY, Ph.D. University of Michigan 1987. Women's Work, Men's Work: Occupational Segregation by Sex in Nineteenth Century Cincinnati, Ohio
- CASE, JAMES C., Ph.D. University of Wyoming 1986. Contributions to the Economics of Time Preference
- CHUN, TAECK SOO, Ph.D. SUNY at Albany 1987. The Rational Expectations Hypothesis in the Long Run: Empirical Tests Using Survey Data
- CHUN, YOUNGSUB, Ph.D. University of Rochester 1986. Essays on the Resolution of Conflicting Interests
- COLEMAN, WILBUR JOHN, Ph.D. University of Chicago 1987. Money, Interest, and Capital
- DURLAUF, STEVEN N., Ph.D. Yale University 1986. Essays in Econometrics and Macroeconomics
- GAVIN, MICHAEL, Ph.D. Massachusetts Institute of Technology 1987. Three Essays in Macroeconomics
- GERBER, JAMES B., Ph.D. University of California, Davis 1986. Southern White Schooling, 1880-1940
- GIANNIAS, DIMITRIOS APOSTOLOS, Ph.D. Carnegie-Mellon University 1987. Differentiated Products: Solutions to Equilibrium Models
- HANIC, MARCO, Ph.D. Massachusetts Institute of Technology 1987. Differential Gaming Models of Oligopoly
- HANSEN, GARY D., Ph.D. University of Minnesota 1986. Indivisible Labor and the Business Cycle
- HAYES, MICHAEL NEIL, Ph.D. University of California, Davis 1986. Mercantile Incentives: State-Sanctioned Market Power and Economic Development in the Atlantic Economy, 1553-1776
- HERK, LEONARD F., Ph.D. University of Virginia 1986. Capacity Precommitment, Demand Randomness, and Market Equilibrium
- HISNANICK, JOHN J., Ph.D. West Virginia University 1986. The Local Dynamic Stability of a General Equilibrium System with Varying Speed of Adjustment Coefficients
- INGRAM, MARLYNNE BETH FISHER, Ph.D. University of Minnesota 1986. Equilibrium Modelling of Asset Prices with Rational and Irrational Agents
- IRWIN, JAMES R., Ph.D. University of Rochester 1986. Slave Agriculture and Staple Crops in the Virginia Piedmont
- JEONG, KUK-HWAN, Ph.D. University of Washington 1987. A Time-Series Test of the Rational Expectations Macromodel—An Application of the ARCH Process
- JOHNSON, ROBERT A., Ph.D. Princeton University 1986. Essays in Macroeconomic Analysis
- KAHN, JAMES, Ph.D. Massachusetts Institute of Technology 1986. Inventories and the Volatility of Production

- KAMIYA, KAZUYA, Ph.D. Yale University 1986. Existence, Uniqueness, and Computation of Equilibria with Increasing Returns
- KAPURIA, VIBHA, Ph.D. University of Pittsburgh 1987. The Antecedents of Modern Theories of Economic Growth
- KAUFMAN, DENNIS A., Ph.D. University of Kansas 1987. Altruism, Externalities, and Welfare
- KERR, IAN A., Ph.D. Florida State University 1986. Theories of Economic Value: Value Theory in Economics and Its Foundations in Philosophy
- KOCHERLAKOTA, NARAYANA, Ph.D. University of Chicago 1987. State Nonseparability: Theory and Empirical Implications
- KONECNY, RONALD T., Ph.D. University of Nebraska 1987. Input-Output Multiplier Distributions from Probabilistic Production Paths
- KOONT, SINAN, Ph.D. University of Massachusetts 1987. Three Essays in Economic Theory: I. Unequal Exchange II. A Shortage-Based Macro Growth Model for a Socialist Economy III. Foreign Trade Pricing in Centrally Planned Economies
- LAHIRI, SOMDEB, Ph.D. University of Minnesota 1986. Analysis of Infinite Horizon Dynamic Economics
- LARAMIE, ANTHONY, Ph.D. Clark University 1987. A Critique of Kaleckian Macroeconomics
- LKE, YOUNGWHAN, Ph.D. University of Pennsylvania 1986. Essays on the Existence, Optimality and Indeterminacy of Equilibria in Economics with Financial Markets
- LEITZEL, JAMES A., Ph.D. Duke University 1986. An Information-Theoretic Model of Incomplete Contracts
- LELAND, JONATHAN WARD, Ph.D. University of California, Los Angeles 1986. Individual Choice Under Uncertainty: Finite Discriminatory Ability and Systematic Deviations from "Strict" Rationality
- LO, GEORGE POON-SHING, Ph.D. University of Minnesota 1987. Pareto Optima and Sequential Rational Expectations Equilibrium in Environments with Adverse Selection
- LOUNGANI, PRAKASH N., Ph.D. University of Rochester 1986. Sectoral Shifts and Aggregate Unemployment
- MCCALLISTER, TODD L., Ph.D. University of Virginia 1987. An Experimental Test of the Effects of Risk Aversion under Final Offer Arbitration
- MCINTIRE, RICHARD M., Ph.D. SUNY at Stony Brook 1987. Equilibrium Theories in Economics
- MODY, ASHOKA, Ph.D. Boston University 1987. Growth of Firms under Uncertainty: Three Essays
- MOEN, JON, Ph.D. University of Chicago 1987. Essays on the Labor Force and Labor Force Participation Rates: The United States from 1980 through 1980
- MOSSER, PATRICIA, Ph.D. Massachusetts Institute of Technology 1986. Essays on Inventory Behavior and Excess Volatility
- MUKHERJEE, RAVISANKER, Ph.D. SUNY at Stony Brook 1986. Sequential Bargaining with Two Buyers: Effects of Equilibrium Concepts and Timing of Offers on the Outcome
- O'CONNELL, STEPHEN, Ph.D. Massachusetts Institute of Technology 1986. Essays in the Macroeconomics of Debt
- PAEDES, MIGUEL, Ph.D. University of Utah 1985. Economics, Coalitions and Abstract Spaces
- PASCOA, MARIO RUI MIRANDA GOMES, Ph.D. University of California, Los Angeles 1986. Noncooperative Equilibrium and Chamberlinian Monopolistic Competition
- RAMADAN, OUSSAMA H., Ph.D. Michigan State University 1986. The Nature and Significance of "Supply-Side Economics"
- RICKMAN, DAN S., Ph.D. University of Wyoming 1987. Essays in Applied General Equilibrium Analysis
- RODDY, VERNON E., Ph.D. University of Tennessee 1986. A Homely but Intelligent Study in the Economic Theory of the Barro-Grossman Lifecycle Model of National Employment and Production

### NOTICE TO ALL GRADUATE DEPARTMENTS

The *Journal of Economic Literature* will print the eighty-fifth list of recipients and titles of degrees conferred in economics in U.S. and Canadian universities and colleges for the academic year ending June 1988. This announcement is an invitation to send information for the preparation of the list.

By June 30, 1988, please send individual 3 x 5 cards, conforming to the style shown below. Please use the *JEL* classification system that is printed in each issue of *JEL*.

### ALL ITEMS AND INFORMATION FOR THE 1988 LIST SHOULD BE SENT TO:

*The Journal of Economic Literature*, P.O. Box 7320, Oakland Station, Pittsburgh, PA 15213

<i>JEL</i> Classification No. _____
Name: <u>Last Name, First Name Initial.</u>
Institution Granting Degree: _____
Degree Conferred (Ph.D. or D.B.A.) _____ Year _____
Dissertation Title: _____

# Index of Authors of Articles in the Subject Index

This *Index* includes all articles included in the *Subject Index*; the numerical references (arranged randomly) are to the *subject classification(s)* of the article. Classifications for different articles by the same author are separated by a semicolon, *page number(s)* for abstracts appear in italics in parentheses for articles with abstracts. If an article is written by two or three authors, each author is listed separately; if by four or more authors, it is listed under the first author only, followed by *et al.*

The list, produced by computer, is alphabetized letter by letter; the entry is then truncated to the last name and initials. This method leads to such anomalies as: (1) an author may be listed twice if only initials appear in one article and full name(s) in another; (2) alphabetization may appear to be incorrect on the second initial.

Examples are given from both anthropology and economics. *J. Econ. Issues*, June 1987, 21(2), pp. 587-603. University of Tennessee.

**Williams, William W.**—Institutional Propensities to Publish in Academic Journals of Business Administration: 1979-1984

This research has attempted to identify those institutions whose faculties have demonstrated propensities to contribute to leading academic journals of business administration during the period 1979-1984. Three core journals in each of the fields of accounting, behavioral management, finance, management science, marketing, and general business were surveyed and the institutional affiliations of the authors were tabulated. In general, it was found that contributions to the journals in each field tended to be concentrated among a relatively small set of institutions. Comparisons were also made to a similar study covering 1972-1978 to trace longitudinal tendencies in publication activity. While the mix of institutional contributors to individual disciplines experienced some volatility, composite rankings, reflecting aggregate institutional contributions to all six areas, remained relatively stable across the two time periods. *Quart. Rev. Econ. Bus.*, Spring 1987, 27(1), pp. 77-94. Louisiana State University.

#### 020 GENERAL ECONOMIC THEORY

**Frey, Bruno S.**—Economists Favour the Price System—Who Else Does?

Most people except professional academic economists resist or reject the use of the price system. The four main reasons are: lack of information; undesirable distributional consequences; unfairness and reluctance to trade; and adverse effects on preferences. The reasons brought forward against the price system are only partly convincing, particularly in comparison to other decision-making systems. The use of the price system may create more problems than traditional neoclassical economics admits. The difficulties and paradoxes connected with the use of the price system provide a challenge to existing economic theory. *Kyklos*, 1986, 39(4), pp. 537-63. Institut für empirische Wirtschaftsforschung, University of Zurich, Switzerland.

**Silber, Jacques**—Rationality, Self-Coordination: On Some Current Issues in Economics

This article reviews some of the important controversies in economics and three kinds of debates: one relating to individual behavior, the externalization, and the relevance of the bounded rationality; a second on the essence of coordination in markets; the centrality of equilibrium and the importance of strategic behavior; a third on principal-agent relations, within firms or between citizens and the state. *Econ. Notes*, 1986, (3), pp. 1-20. University of Southern California.

#### 021 General Equilibrium and Disposal Theory

**Forsythe, Robert and Suchanek**—Decentralizing Constrained Pareto Allocations in Stock Ownership: An Impossibility Theorem

The authors demonstrate that if information about unowned firm assets is revealed in the market, the set of decision rules for firms that decentralize constrained Pareto optimal allocations for a robust class of economies does not result holds whether or not markets are complete. The authors show that the inefficiencies are a consequence of informational imperfection and can only be avoided if investors have essentially full information. The structure of the authors' impossibility theorem leads them to conclude that, in general, the economy can be decentralized better than when firms are valued. *Int. Econ. Rev.*, June 1987, 28(2), pp. 1-15. University of Iowa; University of

**Repullo, Rafael**—The Existence of a Competitive Equilibrium without Free Disposal with Transaction Costs and Incomplete Markets

This paper presents a general model of an economy with transaction costs, and shows the existence of a competitive equilibrium. T. C. Bergstrom's procedure to disprove the free disposal assumption. Since economies with complete markets are shown to be

compared with the alternative of incorporating R and D into production units. Given the heavy pressure exerted on managers to fulfill short-term production plans, little attention is paid to R and D and in many cases R and D capabilities are used to meet production quotas (see below). Since 1973 several new organizational schemes ("production-technology" and "science-production" associations) have attempted to bring R and D and production under one managerial umbrella. The results of this compromise have been mixed, at best, and many of the previous problems still prevail (Berliner 1983c; Hanson 1981, pp. 56-57). The main problem, and probably the cause of the preference for separation, lies in the difficulty of focusing the rewards for innovation solely on its direct economic benefits. In reality separation's potential benefits to innovation do not materialize because of exogenous disruptive interferences such as problems of supply and of prices being fixed too low.

The reluctance of enterprise managers to introduce new methods and products is a major obstacle to technological change and one reason there is a preference for directing much innovation to new enterprises at the expense (as previously discussed) of high costs in terms of investment funds and a high proportion of construction in total investment. The resistance of managers to innovation stems largely from the bias imposed on them from above in favor of short-term production. Most activities connected with innovation involve some sacrifice of present performance, like changing sources of supply (a high-risk proposition), retraining, and a period of experimentation and quality adjustments. New materials or equipment needed may be in short supply, the limited quantity produced being earmarked for military or other top-priority claimants. Because the

introduction of a new method is usually part of a plan, there is always the danger that plan targets will be adjusted upward to more taxing levels. The strong seller's market and the lack of real competition reduce the pressures on managers to improve their products. In this respect the absence of the "kicking foot" of competition is, according to Berliner (1976, pp. 526-30), a more serious obstacle to innovation than that of the "invisible hand." In such an atmosphere, the rewards to managers for introducing innovations are rarely big enough. These rewards have recently been raised, but apparently still not sufficiently to offset the overwhelming dominance of the output target. Providing stronger incentives to innovation is hindered by defects in the price system, and by the danger of development of undesirable side effects—spurious innovations and false "new" products. Berliner (1976, Ch. 17), who analyzed the innovative activity in terms of a balance between risks and rewards, concluded that under the Soviet system both are lower in comparison with the situation in a market economy. Rewards, however, are much lower, thus causing poor outcomes. One may raise the question whether a socialist system can at all offer the kind of material incentives in both income and wealth needed to encourage innovations from below. Finally, resistance to innovation is based on complaints about the quality and effectiveness of proposed innovation by the R and D sector itself, not always without some justification.

One major consequence of the problems listed above is that both in new projects and in existing enterprises, lead times for introducing new innovations are usually very long. As a result, large investments remain pending for long periods, and technologies sometimes become obsolete even before their introduction (Hanson 1981, pp. 65-73).

advantage, opinions still differ as to (a) the extent to which Soviet trade really conforms to this principle—whether (given distorted internal prices) Soviet planners can guide their trade along these lines in the first place—and (b) the extent to which the actual outcome exploits the full potential of benefits from trade.

Rosefelde (1973, 1974, 1977, 1981) believes that the Soviet Union can overcome price calculation problems and can lead trade according to what he calls "fundamental comparative advantage" which goes most of the way toward full comparative advantage. Other students are more skeptical. In fact, the inability to calculate correct prices is presented as a major cause of the Soviet tendency toward autarky (Holzman 1974, pp. 139–41; Hewett 1974; Carl H. McMillan 1973, 1974; see also Stephen H. Gardener 1979; Holzman 1976, Ch. 3; Michael Marrese and Jan Vanous 1983; Charles Wolf et al. 1983). Whether or not calculation of correct prices is feasible, the virtual insulation of producers and users from the direct impact of world prices is a source of long-term economic inefficiency and, in essence, an autarkic element, the actual trade volume notwithstanding.

In his study of technology transfer to the Soviet Union, Hanson (1981, pp. 138–39) suggests that in a large country such as the Soviet Union, where imports of technology from the West cannot constitute more than a modest proportion of total investment in equipment, it is relatively simple to identify the spheres of greatest need. This argument may be extended to trade to indicate that although big mistakes may not be made, many small ones are highly probable. This suggests that while the Soviet Union does indeed benefit from trade, at least from trade with the nonsocialist world (Hewett 1983; Everett M. Jacobs 1978),

such benefits must be to some degree limited. The major forgone benefit, however, is the isolation of the domestic economy from the competitive pressure of world markets.

### V. *The Socialist System and Its Growth Strategy*

The growth record and patterns described here were shaped by an economic-political system and a growth strategy usually called socialist. This section surveys, in the light of relevant Western writings, the central features of that system and strategy, and relates them to the growth record and patterns mentioned.

#### A. *The Objective Function and Catching Up*

An underlying driving force has been the desire to catch up rapidly with the West, even to "overtake and surpass" (Joseph S. Berliner 1966). Berliner quotes Stalin's famous call in 1931: "We are fifty or a hundred years behind advanced countries. We must make good the distance in ten years. Either we do it or they crush us" (Berliner, 1966, 161). Since then, similar pronouncements have frequently been made, in 1961 the goal of surpassing the West within the "current decade" (1961–1970) was officially incorporated into Communist party program by Khrushchev and remained there until the 1970s revision, when it was replaced by more general language (Communist Party of the Soviet Union 1960, p. 512; 1985, p. 9; Gregory Grossman 1962).

This powerful drive is apparently generated by a number of forces. First is doubtless a manifestation of the tension that builds up in a follower country between the distance it has to travel to reach economic modernization and
